Science also classified these doctorates according as they are conferred for investigation in the natural and exact sciences or in what are called humanistic studies. The numbers happen to be precisely the same, 189 in each table. Of the former chemistry attracts 39, zoölogy and botany, 34; physics, 25; psychology, properly included in this class, 21; mathematics and physiology, 13 each; geology and paleontology, 12, and other sciences a smaller number. In the humanistic class, not supposed to be "exact," economics, sociology and political science were studied by 50 candidates, the German or Romance languages by 28, English by 27, Greek or Latin by 23, history by 22, Oriental languages and philosophy by 14 each, and other studies attracted less than ten each.

Twelve years ago not over 200 doctorates in philosophy were conferred in a year. Now the number has nearly doubled. They are conferred by those institutions that have strong graduate schools, and of these Chicago, Columbia, Harvard, Yale, Johns Hopkins, Pennsylvania and Cornell have in twelve years conferred 2,579 degrees, as against 892 by thirty-five other universities.

There seems to be a very fair division of choice among the students between the sciences and the humanistic studies, one half to each. But the equality is maintained by the large number who devote themselves to sociology and economics, new studies in the universities. And yet the languages are not neglected, nor are they likely to be, for this year 27 doctorates were given for English studies, 14 each for German, Romance and Oriental languages, 12 for Latin and 11 for Greek. These studies are eternal-

ly attractive, for their relation to the human mind. Of the exact sciences not all are of the bread and butter sort. A study of mathematics (13 doctorates), or astronomy (7), or psychology (21), does not enrich the national treasury. If we were to classify studies by their usefulness for economic production we should make a very different classification, and the "useless" studies would have the advantage; for the most of zoölogy, botany, psychology, geology, astronomy, anthropology, mineralogy and geography would leave the practical money-making class, while there would be no loss on the other side. We are still predominantly an idealistic people, if we may judge from the comparative attractiveness of studies to our most competent and ambitious young scholars.

The Country Life Commission and the Church

THIS week we conclude our series of three editorials on the report of the Country Life Commission with a discussion of the rural church. The Commission has a definition of the country church of the future fully as emphatic, and not alien to that of Mr. Eliot's. It insists that the rural church must become the social center of the neighborhood. This does not mean merely that there must be a building with a steeple, for holding social gatherings, but an organic force affecting the tone of the whole community. The great spiritual need of communities just now is higher personal and social ideals. A part of church work is educative, and it should culminate in giving to all the young people a love for the country and an intellectual appreciation of it.

Professor Bailey, chairman of the Commission, tells us that the religion of the open country must run into the indigenous affairs of everyday life; adding that "a course in a good agricultural college would wisely supplement training in a theological seminary." The church must get a firmer grip upon human life as it is here and now. Why should it not shift its work to modern times and customs, making the basis of religion the simple performance of the Golden Rule? The re-

ligion embodied in the Old Testament was eminently a religion of sanitary laws and wholesome living. Its promises were long life, large families, and a land that flowed with milk and honey. It made no reference whatever to a future life. The religion of the New Testament dawned as peace "on earth."

As for the theological seminary affiliating with the agricultural college, why not? Ministerial training is certainly a very different affair from what it was forty years ago. Chicago has established a School of Civics and Philanthropy, the object being to prepare its pupils for a new sort of ministering. They have listened to lectures on systematic benevolent work in the slums, and to other lectures on the novel issues which are arising between the laborer and the capitalist. Having studied the physical as well as the mental and moral tendencies of the children of the poor, they will be able to coöperate with the juvenile court for delinquent children and the playground movement for all children. If "cooking sales" could be changed to cooking schools would it be any the less religion?

The minister of a rural church ought to know more of what Jesus knew, and what Burbank knows; that is, a good deal about flowers of the field and about the farmers' crops; and he ought to know the science of agriculture right up to date. On a Sunday, if it comes to a pinch between having his parishioners' hay get wet and his church get empty, why should he not put his manuscript in his pocket, take a hay fork in his hand and help his poorest parishioner secure his crop. This should be his comprehension of righteousness and duty.

We know a minister who has five acres of garden in the suburbs of a small city. He has eighty beds of flowers, and some of these he allows the manlier boys of his church to work on their own account. They can exercise their own judgment in the selection of stock, can pluck the flowers freely for their own use or homes, and still more freely can distribute them to the poor. You can find in the garden one hundred varieties of roses, as many more of gladioli, all of the noblest lilies and irises, and whatever else makes garden life attractive and

mentally, but better yet, you can find after school on all Saturdays a dozen boys of manly fiber, each at work developing his power to see, to hear and to feel with Nature, and to work where his best seeing and hearing direct. Once a week the gates of this garden are flung open and a reception for both old and young is held. The grounds are crowded with friends moving about in this finest of all sympathies which comes from being inspired with love for life. Strawberries border all the beds and are freely used in the way of study and comparison, while other senses are feasted with rich odors.

It is questionable whether this man's sermons on Sunday are anywhere equal to the nature instruction which comes from his garden. He himself is inclined to think the garden the more important, and that there is altogether too much formalized preaching in the pulpit. He is inclined to use the words God and Nature as very nearly tautological; and the God whom he most fondly preaches is Eternal Life, eternally expressing Himself in the true, beautiful and good. The whole church organization runs on this line, and it is not held to be alien to religious work to create a new sort of strawberry, or to make an asparagus bed give twice as much food for the dining table. Children love the church as the center of beautiful life, and old people wear flowers in their coats as they gather on Sunday. The minister spends half of his time either in his own garden or in their gardens and fields, talking grapes and pears, instead of original sin and total depravity. His study is the resort of those who are troubled with practical everyday problems. Teachers go to him to settle the quarrels of the school room, and parents consult him about the training of their children. He cares little about the creeds, but he trains his young folk to know how to do things and how to be straightforward citizens. This sort of common sense and everyday religion does not make vestals or saints, but it does make men and women. Is it enough?

Some conversation dwells on garden and olive orchards. Why shall not the minister take our boys and girls—and older people, too, on walks about the fields

and tell them some of the high-born stories of life and growth? Instead of preaching about Jesus, why not do what Jesus did; did take a class of the fittest fellows, the Peters and Johns (there are plenty of them everywhere), and train them to be leaders? Experiment Station Bulletins are one of the modern forms of inspiration; revelations of the Divine Will in Nature.

There are a few towns in the United States, altogether too few, where efforts are being made to combine and center moral effort to put down evil and establish the right—that is righteousness. The people have yet to learn, however, that civic "rightness" and religious "righteousness" are the same thing. They are penetrated with a vague irreligious conception that righteousness has to do only with another life. As soon as possible the people must learn that casting an honest vote is religion as much as reading the Bible. We can hoe righteously as we can play unrighteously; and he is God's son who tills honestly in his corn field or makes two blades of grass grow where one grew before. Our whole lives, individually and collectively, constitute the religion that counts. "*Laborasse est orasse*," said Martin Luther; to work well is to worship well. Our hands as well as our hearts must serve and pray. We do not let down religion by this worldliness; we exalt the world as the gift of God.

The Report does not undertake to make less of the Church, but to give it a larger leadership, both as an institution and thru its pastors. It points out the necessity of church federation, so that some one church shall be responsible for every square mile; in this seconding the national movement which is under way. It believes that sectarian strife should immediately yield to an effort to reach the entire community. There are ten thousand church buildings in the United States now out of repair and use, standing on the hill slopes and in the rural hamlets, as an indication of changing belief and changing habits. There are ten thousand more that ought to go out of use, as indicative only of diverse conceptions of a future world, leaving the field to a united effort of all the people for all the people. This will leave us organically

strong to establish the right and defend the true. Better yet, it will enable us to work out a national religious character. "The work and the life of the farm are closely bound together, and the institutions of the country reflect this work and life."

The Young Turk

So far the Young Turk has done very well both in national and international affairs. The recrudescence of the Cretan question will test still further his ability to meet the peculiar difficulties of the situation. If he can first persuade himself, and then the nation, that it is wiser to let the island be a thorn in somebody else's side rather than his own, he will achieve a notable victory and go far toward convincing the world that he is a useful, rather than a disturbing factor, in the solution of the most troublesome problem of European politics. More than that, he will have vindicated the claim of the Turkish race to be one of the virile races of the world.

It must be remembered that the Young Turk is a distinctly modern product, and represents the resultant of the same general conditions that have produced the American. On to the fundamental Tartar stock, brave, self-reliant, simple in life, rather narrow in vision, peaceful, if let alone, but intolerant of opposition, have been grafted many of the characteristics of the Aryan races. The harem, with its representatives of other peoples of varying intellectual, moral and religious types, has been a more important element than many realize. Partly as a result of this infusion of new blood, partly as the natural consequence of modern intercommunication, the child of the heterogeneous harem became a cosmopolitan. For a time this was scarcely to his advantage. He appeared to be more or less of a hybrid, neither Turk nor European, neither Moslem nor Christian, and was accordingly scouted by all. Little by little he has emerged until he appears today as an upholder of constitutional law, a believer in religious freedom, an up-to-date man of the world.

In estimating his value in the present emergency, certain facts must be kept in

mind. He has a genius for government. Hitherto it has been principally manifest in bad government, but bad or good his nation and race have managed to keep the upper hand wherever they have been. They have succeeded in suppressing disturbances, whenever they wanted to, and have preserved not merely the semblance but the reality of rule, both in Turkey and Persia, for the Kajar of Teheran is first cousin to the Ottoman of Constantinople. This has been attributed to the weakness of the other elements, but that is only partly correct. Whatever allowance be made for such conditions the fact remains that the Turk has succeeded in compelling obedience, the first and most fundamental quality of rule.

He is also the dominant element in a country which is practically a geographical unit. Macedonia is not an integral or essential part of the Turkish Empire. That extends from the Bosphorus to the Persian border, from the Black Sea to Arabia. The talk about the partition of the Turkish Empire too often ignores the geography of that empire. To divide Asiatic Turkey would perhaps not be an impossibility, few things are impossible, but it would entail an expense in life and cash which no European nation or combination of nations would or could incur.

The test of the Young Turk will come with the question as to whether he is willing to recognize his limitations as well as his possibilities. If he is shrewd enough to perceive that his remaining European provinces are still, as they always have been, a source of weakness rather than of strength, and will devote himself to the development of the section which is distinctively his own, he will succeed. That section, with its fertile plains and mountains, rich in mineral resources, is ample to satisfy his highest ambition.

But what about his religion? He is Moslem, and Islam, in the long run, must yield to Christianity. Can the Young Turk effect the transition? There are many indications that that also is in his mind. He may not, probably will not, adopt the Westminster Confession, the Thirty-nine Articles, or the decrees of the Council of Trent, but we are learning that these are historical developments of

Christianity rather than their essential elements. As he comes to know Jesus, whom he already honors, Mohammed will yield, and the Gospels take the place of the Koran. It is for the Christian nations to show him by their relations with him that the essential elements of their faith are "to do justly, to love kindness, and to walk humbly with his God." Then shall the Turk come into his own.

Hazing and Hoodlumism A New York magistrate has been letting the young ruffians go unpunished who have been arrested for rowdyism on the cars, to the great annoyance of passengers while returning from a ball game. They do it differently in West Point, where seven young men, one of them in the graduating class, have been expelled, with the approval of the President, for outrageously assaulting a member of the lowest class. Possibly the levity shown by President Roosevelt in a similar case, pardoning those whom the law of Congress required to be expelled, may have encouraged these ruffians in uniform to think they could break rule and law and decency with safety. There will be the strongest effort made to persuade the President to pardon and reinstate them, but discipline ought to be maintained. The men who would be guilty of that sort of brutality which sends their victim to the hospital are not fit to be put in command of enlisted men. We are glad to know that hazing is going out of fashion in our colleges, thanks to student sentiment and self-government, and it ought to be stamped out in West Point, if the young men themselves are not willing to suppress it.

Uniform State Legislation While we are actually going thru the process of amending the Constitution, the ends desired might often be as well secured by uniform State legislation; and this is a duty which the National Association of Lawyers is in part attempting, as in the matter of the laws of marriage and divorce. But other organizations can help, such as the National Association of State Dairy and Food Departments, which is attempting to secure uniform laws that shall protect

the purity of food products. Its first success was in securing the Federal pure food act; and its next effort is to persuade the several States to enact the same law. It has drawn up a model act to be presented to the Legislatures; but it should first be made Federal law, by amendment of the present act, and then adopted by all States whose Legislatures desire to protect their people rather than to please and profit cheap purveyors of poor food. Let all the people speak for the protection of their own tables; and this is a task especially for women. We want to know just what we eat and drink. Dr. Wiley tells us that wine is not wine if made from anything but the juice of the grape; it is not cherry, nor sugar, nor aromatic oils. If these are added let us know it, still more in foods.

That Colon Ditch Not many years ago a gentleman by the name of Poultney Bigelow wrote an article for THE INDEPENDENT criticising conditions on the Panama Canal. For this he was made the object of a furious attack by President Roosevelt denying the charges in his customary emphatic language. Nevertheless the things Mr. Bigelow complained of are one by one quietly remedied in the course of time. The latest is the famous D street drainage canal thru the middle of Colon which he denounced as a useless piece of expenditure, unsanitary and offensive. The smell from it has become so strong and disagreeable as to be unendurable, and the citizens proposed to get up a monster petition to President Taft for its abolition. But this will not be necessary, as the Canal authorities have decided to take the matter in hand and remedy the conditions. Part of the canal will be filled up and the rest converted into a covered concrete sewer.

The Spanish Rioters' Complaints The recent riots in Barcelona witnessed chiefly the destruction of religious houses. It seems that three root grievances tended to stir up the republican spirit of Catalonia. One was a contract to the English firm of Victors, Maxim & Co. to construct the new navy; a second was the renewal of the annual grant of 10,000,000 pesetas to

the Compagnia Transatlantica, which is looked upon as a monopoly; the third and chief was the tacit permission on the Government's part in allowing the expelled religious of France to settle in Catalonia, especially in and around Barcelona. The attacks were chiefly directed against churches, monasteries, and convents. Of thirty-seven destroyed, all but three were utterly wiped out, but *there was no looting*, save the desecration of the dead nuns of the Arrepentidas. In all this work the women of Barcelona took a leading part, and even a number of priests not belonging to the orders. On the part of the religious orders there was little resistance, save by the Jesuits, who were armed with Mausers. Their house is of enormous size, built like a fortress in the heart of Barcelona. The walls and bronze gates were a stout defense. Four streets lead up to it, which the crowd filled. But the Host of Israel were ready and the Jesuits fired with deadly results from the Mauser rifles, which in some way or other found their way into the convent. It was a night battle and lasted a couple of hours. It was Spaniard against Spaniard, Catholic against Catholic, layman against priest. It was not mainly against the Church, but against the ecclesiastic domination.

Advice to Turkey

The Powers that are responsible for peace in Crete have not only shot down the Greek flag raised by the people at Canea, but have given "advice" to Turkey. The Porte had threatened war with Greece if the latter Power refused to declare that it would not accept the annexation of Crete, and the Powers tell Turkey that this was not the way to do, but that she should have come to them for justice if Greece interfered with her rights. That is well, and an excellent precedent for other similar action. Why in the case of Crete only? Why in any other difficulty threatening war should not the half dozen strongest Powers in the world agree that they will not allow war, but will insist that any dispute be settled by diplomacy or by the Hague Court? To be sure they had already taken Crete, by major force, under their control, and have not thus taken the other nations. But there is the same right of humanity,

and the same assurance that their mutual jealousy will not allow them to do injustice while assuring peace. Similarly the United States, Mexico, Argentina and Chile might take the responsibility of forbidding any war on the Western continent. What is good for Crete, and no injustice to Turkey and Greece, would be equally well for the rest of the world. Of course, there would remain the old question, "*Quis custodiet ipsos custodes?*"

Senator Joseph W. Bailey, whose connection with the Waters-Pierce Oil Company is well known to the whole country, and whose incendiary speech when re-elected to the Senate can never be forgotten, is back in Texas and on the stump again. In a recent public speech in his home State he again declared truceless war on his enemies, and later that he had forgiven them all. While it is true that he had a small majority in the Texas Democratic primaries a few months ago, it is a well known fact that he achieved this victory by an alignment with the brewers and liquor dealers of southwest Texas, while leaving the impression in the minds of the local option and prohibition forces of north Texas that he was still favorable to State prohibition. A man of this sort is a blot on any State and any cause, and it will be a happy day for Texas when that State repudiates him.

The strike at McKees Rock is by no means a mere strike; it is murder. Not less than five men were killed last Sunday, and scores were wounded. It has developed into a campaign of wilful assassination by any weapons that can be had, and the constabulary is powerless. Think of a thousand rifle shots at the searchlight before it was put out, and no force to stop it. This has been going on for weeks. Beyond all question the strike is a legitimate weapon, but rifles and bombs and bands of fighting women are not. If strikers cannot gain their end by striking and appealing to the sympathies of the people, let them persuade the Legislatures, if they can, to forbid the importation of laborers from other States, the building of stockades and the restraint of access to the scabs for peace-

ful missionary purposes, but no murder. This strike appears to be justified, but not the means to maintain it.

The Periplus of Hanno was financed by the Carthaginian Government, as the Wilkes expedition was paid for by our Navy Department. We recall that of exploring expeditions privately supported, Mr. Stanley's explorations in Africa brought him fame and money and a seat in Parliament. But Lieutenant Shackleton's fine dash at the South Pole and the ascent of Mount Erebus had left him \$70,000 in debt; and it is said that his bankruptcy came from the failure of certain rich Americans to keep their pledges of support owing to the late financial reverses. The British Government has very properly made a subscription of \$100,000, which will relieve him, and we trust his lecturing tour in this country will help him in a new expedition, if he is not anticipated by some luckier man in reaching the Pole.

One Legislature, that of Alabama, has voted to approve the amendment to the Constitution allowing an income tax. But that was expected. Other Legislatures hesitate to meet in session in the dog days. The Alabama Legislature had other business to do, in making the State dry both by statute and constitution, and could take up this other amendment, which Mr. Bryan has bidden all States loyal to him to pass at the earliest opportunity, even if they had to call a special session. And a special session has been called in the State of Washington, and it follows Alabama in speedy approval. It is the rich States on the Atlantic coast that are doubtful.

Do the English suffragets imagine they will gain credit and votes by such vulgar arguments as they adopted last week when Secretary of War Haldane was speaking? They hurled bottles and brickbats thru the windows of the hall, and seven of them succeeded in getting arrested. We hardly can call this a political offense. Mrs. Pankhurst, the suffraget leader, is to be allowed by the immigration authorities to land, altho she has been in an English prison for a "political offense."

The Legislature of Alabama by a large and decisive vote has submitted a prohibition constitutional amendment to the voters of that State, to be passed on in the next few months. The preceding Legislature adopted statutory prohibition, just as the State of Georgia did, but that has not satisfied the strong temperance and prohibition sentiment in that State. Undoubtedly the State of Alabama will ratify the prohibition amendment, and the same will be true in every Southern State as fast as the opportunity is afforded them to adopt prohibition constitutional amendments.

We add one suggestion to Mr. Powell's admirable article on street shade-trees. It is that in laying out new towns the streets be named alphabetically after the names of the shade-trees. Thus the first might be Ash street, the second Beech street, the third Chestnut street—and so thru the alphabet. It would help the children know the names of the trees planted by them. In certain cases, as in Oak street, various species of oak might be selected.

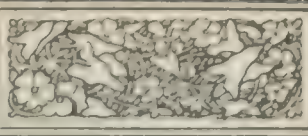

We take it from a Galveston paper, and so we take it to be true, that over the line in Louisiana a negro was hanged from a tree near his house and his body riddled with bullets for the new crime of bringing suit against a white resident who had killed his cow. He must have been a "bad negro" to appeal to the courts, while the lynchers were respectable citizens.

The Chinese have taken to reading translations of European books with the greatest avidity, and in some cases it has not been possible to print them fast enough to supply the demand. That this is not an unqualified benefit is shown by the fact that the book which stands at the head of the list of "best sellers" in China is *Dumaux's La Dame Aux Camélias*.

Here is more argument for the protection of forests. The Canadian Government reports \$25,500,000 loss last year from timber damage by fire. A considerable portion of this will be saved when our railroads are installed with electricity.

Insurance

The Prudential's Answer to Blanchard

The Prudential Insurance Company of America, of which ex-Senator John F. Dryden is president, announced not long ago a proposed distribution of a surplus of \$20,000,000 among the company's industrial policy-holders. When this announcement was made Leon F. Blanchard, a holder of 725 shares of Prudential stock, entered suit against the company praying for an injunction to restrain the proposed distribution of this surplus and seeking to compel the company to make payment of this sum to its stockholders in the form of dividends. The Prudential has now filed its answer to the Blanchard suit. This answer is signed by Richard V. Lindabury, ex-Senator John C. Spooner and Edward D. Duffield, the latter being the solicitor of record. The answer sets forth in substance that the surplus of \$20,000,000 belongs to the policy-holders and that the company's stockholders have been getting all the earnings to which they are rightly entitled. It says that the stockholders of the Prudential Company have received a total return of \$5,503,680 on an investment of \$91,000 in the thirty-four years of the company's operations, in spite of alleged extravagance in management. Mr. Blanchard's stock holdings, the answer says, represent, for the most part, stock dividends apportioned to him from time to time. On January 1, 1880, the answer avers, Mr. Blanchard was the owner of only twenty shares of Prudential stock. Two years later he acquired twenty more from another stockholder, and after that his holdings grew as a result of stock dividends which were declared from time to time, and the transfer to him of stock from the estate of his father. Relative to the complainant's contention that he never assented to a modification of the company's by-laws, effected at a stockholders' meeting held on August 12, 1907, the answer states that the "revision" was approved by the unanimous vote of the directors

present at a board meeting held on that day, and ratified and confirmed the same day at a stockholders' meeting by a vote of 31,127 shares in favor and none against. Defending the payment of dividends to the policy-holders, the defense sets up that prior to 1897 all the companies engaged in writing industrial insurance in the United States charged substantially the same rates of premium as the Prudential for the same amount of benefits, and that all of said companies, then or about that time, followed the policy adopted by the Prudential in that year of paying back to their industrial non-participating policy-holders by way of dividends and increased benefits the excess of premiums collected on their policies.

The Equitable's Book

IN connection with its recent completion of its first half century of existence, some account of which was printed in the insurance department of our issue of July 29, the Equitable Life Assurance Society of the United States, of which Paul Morton is president, has issued a commemorative volume of 125 pages. The text is by William Alexander, secretary, and the *format* of the book is excellent. The biographical features are interesting to a degree. The record of the society's growth reads like a piece of fiction, only stranger, because it deals with truth, and every one realizes that truth is stranger than fiction. The early days of the Equitable were indeed the days of small things, but the little band of men who were responsible for the formation of the Equitable builded better than they realized at the time when they fought only for existence and recognition. The company's first decade was an eventful one. It grew and it grew and it grew. It weathered a panic, growing constantly meanwhile, until today the society writes annually insurance aggregating \$100,000,000. The volume is good reading and its illustrations include the company's foreign and domestic buildings.

FINANCIAL

More Exchange Reform

Nor long after the publication of the report of the commission appointed by Governor Hughes to investigate the exchanges, the Stock Exchange ordered the abolition of its "unlisted department," which had been a refuge for incorporated Trust combinations and other companies that were unwilling to make such reports and statements as are required to be made by corporations whose shares are on the Stock Exchange's regular list. This reform was the first fruit of the commission's report. Then the Metal Exchange decided that its quotations should be determined by actual transactions and not by a committee. This was the second reform due to the commission, which had expressed its disapproval of such a making of prices and had recommended that the Metal Exchange's charter be repealed.

Now comes the third reform, for the Mercantile Exchange has decided to discontinue the making of quotations for butter, eggs and cheese by committee. The repeal of this exchange's charter was also recommended by the commission, which asserted that such committee work "deceived buyers and sellers," adding that "the making and publishing of quotations for commodities, where such quotations do not fairly and truthfully represent any *bona fide* transaction, should be prohibited by law." At first those who represented the Mercantile Exchange were disposed to sneer at the report, saying that it had been made "after a purely superficial investigation by men of no trade knowledge," whose findings were "shallow and useless." But the commission's sound arguments commended themselves to the public. On the 17th inst., at a meeting of the Exchange, attended by 160 members, it was decided by a majority of about two to one that there should be no more "official" (or committee) quotations. Some may have thought that such a fixing of prices in New York by a committee of nine dealers could have only a local effect, but it is admitted that the prices so determined became the current rates as far west as the Missouri River, and that four-fifths of the business on the Chicago, Philadelphia and Boston ex-

changes was done in accordance with the prices made by this New York committee. Obviously the door was open for manipulation in the interest of those who decided what the prices should be. Either the prices quoted on this exchange hereafter should be those which are shown by actual sales, or the exchange should be deprived of its charter.

Railways and Steel

FOLLOWING the recent highly favorable crop report, there has been a noticeable increase of orders for railway equipment. Last week the Atchison engaged 130,000 tons of rails, and the Northwestern placed contracts for 8,000 freight cars, 125 locomotives and other rolling stock, for which \$11,000,000 will be paid. Chairman Knapp, of the Interstate Commerce Commission, expects that the railway business of the year ending with June next will even exceed that of the fiscal year which ended with June, 1907, before the panic. It is already seen that the demands upon steel manufacturers for 1910 will be very large; 200,000 tons of rails for delivery next year were engaged last week. The Steel Corporation is operating all of its available blast furnace capacity, but stocks of pig iron are said to be decreasing. In general trade expansion is reported.

....The first dividend, $1\frac{3}{4}$ per cent. quarterly, on the preferred stock of the United Dry Goods Companies, a holding corporation for the H. B. Claflin interests, was declared last week, and to the regular quarterly dividend of $1\frac{3}{4}$ per cent. on the common stock of the Associated Merchants Company was added a quarterly dividend of $\frac{1}{2}$ of 1 per cent. The first of these companies owns a controlling interest in the second, which controls the H. B. Claflin Company, the O'Neill-Adams Company, Stewart & Co., of Baltimore, J. N. Adam & Co., of Buffalo, and C. G. Gunther's Sons, fur dealers. The holding company has also acquired Hahne & Co., of Newark, the Powers Mercantile Company, of Minneapolis, the William Hengerer Company, of Buffalo, and the Stewart Dry Goods Company, of Louisville.

Survey of the World

The McKees Rocks Strike

On Monday night of last week street car travel into McKees Rocks was suspended by the Pittsburgh Street Railways Company on the ground that its passengers were not protected from the violence of the strikers. The president cited the killing of Deputy Sheriff Harry Exler on Sunday night, while a passenger, and of three other passengers, who were chased from a car before being killed. The riot of Sunday night resulted in at least six deaths, while six others in hospitals were not expected to recover, and seventeen others were in hospitals. The town has been under martial law and the troopers of the State Constabulary in full control, and smarting from the death of two of their number. An effort made by the strikers to have President Hoffstot, of the Pressed Steel Car Company, arrested for peonage failed of success, but an appeal to the United States authorities inaugurated an investigation which gave them fresh courage. This followed a severe blow when Judge J. R. MacFarlane, of the local court, handed down a decision refusing them the right to arbitrate their differences with the company, as they had claimed under a State law. The statute provides for compulsory arbitration of labor disputes after a certain time. The court held that the law is wholly unconstitutional. The strikers had asked the court to appoint three commissioners under the law and demand of the Pressed Steel Car Company the appointment of another three, they themselves appointing the third to sit on the merits of the case. Judge MacFarlane ruled that the law plainly said that any action by such

a committee was not binding on any party, hence it was but a farce and he would be no party to it. Meanwhile perfect quiet prevailed following the death of more than a dozen killed in the riots and the presence of 150 troopers. At the investigation made by the Federal authorities intimidation and outrages amounting to peonage were testified to. It seems that the agents who gathered the strikebreakers in New York did not tell them what was the work they were to be put to, and they found it too hard, and the conditions intolerable, and the brutal treatment extreme. As a result some 400 of the strike-breakers have fled, leaving so small a number that work is practically suspended. The company has refused to pay those who left, or to send them back to New York, on the ground that they have broken the contract to work a month. The Pressed Steel Car Company is seeking \$4,000,000 of fire insurance in the place of \$300,000 it has been carrying. Estimates made by underwriters are to the effect that it will take about 200 companies to supply the required amount of protection.

✱

By law the Postmaster-General is allowed to fix the charge for registering letters as high as 20 cents. In 1874 it was reduced from 15 to 8 cents, but raised to 10 cents the next year, and was reduced again to 8 cents in 1893. Now Postmaster-General Hitchcock finds that there is a very heavy loss of operation at 8 cents, and he proposes to recommend the return to the 10-cent fee. President Taft is taking special interest in the establishment of postal sav-

ings banks, such as have been recommended by a succession of Postmaster-Generals from the time of John Wanamaker, and as was approved by the last Republican National Convention, and he intends to press the recommendation in his next message to Congress. He believes that several hundreds of millions would be placed at the disposal of the Government through postal savings banks. It is suggested that this money might well be employed in taking up the \$600,000,000 or \$700,000,000 of Government 2 per cent. bonds which are outstanding, and which have given much concern to the Treasury Department officials. Already the 2 per cent. bonds are selling below par, and there is fear of further depreciation in view of 3 per cent. issues which have been authorized and which soon may be placed on the market. The interest to be allowed in postal banks is 2 per cent. or less, and the President thinks no harm would be done to the regular savings banks, which pay 3 or 4 per cent. a year. The postal savings bank would appeal to timid people who do not trust banks, and to foreigners who wish the Government's guarantee back of their savings. The Post Office deficit for the year ending June 30 will once more be about \$16,000,000, or as large as the largest in the history of the Department. The deficit is credited to rural free delivery and the carrying of second class mail matter at ruinous rates. It is also to be mentioned that the Post Office carries an immense amount of mail matter free for other departments of the Government. Postmaster-General Hitchcock has other plans to increase postal revenue besides the increase of registry rates, but there is no sign of a reduction in the rural free delivery service, which is so greatly appreciated.

The Legal Profession The American Bar Association's report on the means for reducing expense and delay of judicial trials made radical recommendations:

"The whole judicial power of each State, at least for civil causes, should be vested in one great court of which all tribunals would be branches, departments or divisions. The business as well as the judicial administration of this court should be thoroly organized so as to

prevent not merely waste of judicial power but all needless clerical work, duplication of papers and records and the like, thus obviating expense to litigants and cost to the public.

"This court should have three chief branches, a county court, including municipal courts, a superior court of first instance and a single ultimate court of appeal. All judges should be judges of the whole court, assigned to some branch or locality, but eligible and liable to sit in any other branch when called upon to do so. Supervision of the business administration of the whole court should be committed to some high officer of the court, who would be responsible for failure to utilize the judicial power of the State effectively."

It further proposed laws to limit the setting aside of verdicts on error unless the error complained of shall appear to have resulted in a miscarriage of justice, and to permit the use of authorized printed copies of records in appealing cases instead of written or typewritten manuscripts.—A drastic report on the condition of the bar and bench in this city has been made by the committee on admissions of the New York County Lawyers' Association. It seems that out of the nine law schools in the State, four give the LL.B. degree after two years' study, and in one other it may be so obtained. More than two-thirds of the law schools of the country are now on a three years' basis. The committee recommend that before being admitted to the bar a candidate shall have spent at least two and a half years in a clerkship in the office of a regular practitioner, this following a full course of study in a law school and followed by a thoro examination. They say:

"The average student when he applies for admission has no, or a very inadequate, knowledge of his various duties.

"The student is not instructed in the real nature and function of his office.

"The educational tests, preliminary and general, are wholly insufficient.

"Students are uninstructed in their outside, unprofessional relation to the community."

The most startling passage in the report is that on the judiciary of the city:

"It goes by the mere saying that with the lowering of the moral and intellectual status of the bar, the judiciary have suffered. It will be conceded as a general proposition that lawyers do not reach the bench by assiduous study, high legal accomplishments and professional training. Political organizations have much more to do with their advancement than personal merit. The spectacle of the elevation to a judgeship of a lawyer who is known and appreciated by the bar is a rare one. If the names

of most of the candidates for judicial honors were submitted to the profession they would be overwhelmingly repudiated.

"Of course, a real diamond is sometimes discovered by chance, and undoubtedly some of those chosen by political organizations bring to the bench fair legal attainments, and others, originally deficient, become good judicial officers. But in the main the beach is below the average. The lawyers of New York City today freely talk of the judges. They specify names. They say to one another, "Keep away from that court"; "avoid that judge," meaning beware of their slothfulness, ignorance or immaturity, and comments are indulged in most detrimental to the judiciary, but which indicate with clearness the opinions entertained of the personnel of that important body."

∞

Our Religious Statistics

The Census Bureau has issued an abstract of its report on the religious denominations of the country. The only preceding census report of the sort was that of 1890, this being for the year 1906. There are found to be 186 religious denominations, against 145 discovered in 1890. But during this period 12 ceased to exist and 4 were consolidated with others. By division 13 new bodies appeared, while 48 new denominations were organized or came to light. Of the 186 the Protestant denominations number 164; Roman Catholic, 1; Jewish, 1; Latter Day Saints, 2; Greek Church, 4, and 14 others are miscellaneous, such as Armenian, Buddhist, Spiritualists and Theosophists. There have been formed 212,230 organizations, such as churches or congregations, an increase of 47,079 since 1890. The Protestant bodies increased 42,564, or 27.8 per cent., and the Roman Catholic 2,243, or 21.9 per cent. The total number of Protestant organizations was 153,054, and of Catholic 10,239; and the remaining bodies were only 1,858, giving a total of 165,151. The total communicant membership of the churches was 32,936,445 as against 20,597,954, reported in 1890, an increase of 60.4 per cent. Of these the Protestants had increased from 14,007,187 in 1890 to 20,287,742 in 1906, while the Roman Catholics report a membership of 12,079,142 against 6,241,408. In all Protestant bodies the membership is practically of adults, while in the Catholic all baptized persons are included, even infants. To make the figures more nearly comparable 15 per cent. has been deduct-

ed from the Catholic membership to exclude those under eight years of age. The total Protestant membership is 61.6 per cent. of the total, and the Catholic 36.7, and all other bodies 1.7 per cent. In rank of numbers the denominational families stand in the following order: Roman Catholic, 12,079,142; Methodist family, 5,749,838; Baptist, 5,662,234; Lutherans, 2,122,494; Presbyterian, 1,830,555; Disciples, 1,142,354; Protestant Episcopal, 886,942; Congregationalists, 700,480; Reformed, 449,514; United Brethren, 296,050; German Evangelical Synods, 293,137; Mormons, 256,647; Evangelical Associations, 174,780; Greek Church, 129,606; Friends, 113,772; Christian Conviction, 110,117; Jewish, 101,457 (heads of families only); Dunkers, 97,144; Adventists, 92,735; Christian Scientists, 85,777; Unitarians, 70,542; Universalists, 64,158; Mennonite, 54,798. The various smaller bodies fill up the total number of 32,936,445. It will be understood that in these figures some denominations are single, such as Disciples, Protestant Episcopal and Congregationalist, while others embrace several of the same class, as Methodist, Baptist, Lutheran and Presbyterian. The Catholics report the largest average of members to an organization, 969, while the average for Protestant organizations is only 104. Of the total Protestant membership 39.3 per cent. are males, and 60.7 per cent. females. In the Catholic Church, which includes all baptized persons over eight years old, 49.3 per cent. are males and 50.7 per cent. females. During the last sixteen years there have been on an average eight new churches built every day. The seating capacity for the Protestant churches is 53,282,445, much above the membership, while for the Catholics it is 4,494,377 much less than the membership. The value of buildings owned and used for religious worship, with their equipment, is \$1,257,575,867, of which \$935,942,578 was reported for Protestant bodies, \$292,638,787 for the Catholic Church, and \$28,994,502 for all other bodies. The total amount of debt reported was \$53,301,254 for the Protestants, \$41,488,055 for the Catholics, \$4,556,571 for the Jewish congregations, and \$705,006 for the remaining bodies. The debt represents

5.7 per cent. of the total value of Protestant Church property, and 16.9 per cent. for the Catholic Church. In twenty-nine States a majority of the members reported belong to Protestant bodies, and in sixteen to the Catholic Church, and in Idaho to the Mormon Church. The States in which a majority of the communicants are Catholic are New Mexico, 88.7 per cent.; Rhode Island, 74; Montana, 73.1; Massachusetts, 69.2; Nevada, 66.7; Arizona, 66.2; New York, 63.6; New Hampshire, 63; Louisiana, 61.3; Connecticut, 59.6; California, 58; Vermont, 55.9; Maine, 53.3; New Jersey, 51.5; Wisconsin, 50.5, and Michigan, 50.1. In Georgia, Mississippi, Alabama, Virginia and South Carolina a majority of the communicants are Baptists. The highest percentage for Methodists is 45.5 in Delaware; for Lutherans, North Dakota, 37.7; for Disciples, Kentucky, 15.9; for Congregationalists, Vermont, 15; and for Episcopalians, the District of Columbia, 10. The percentage of church membership to population has increased since the last religious census. It was 32.7 in 1890, and is 39.1 in 1906. The Protestant bodies increased 1.8 per cent., the Catholic 4.4 per cent., and all others one tenth of 1 per cent.

Various Items

President Taft has directed that after July 1, 1910, the enlisted strength of the army shall not exceed 80,000 men. It is now about 88,000.—Mr. Bryan, in *The Commoner*, now puts the tariff forward as the prime question for the next national election. He says:

"The time is passed for sham battles on the tariff question. The only victory we have won on the tariff in recent years was the victory of 1892, when we attacked the principle of protection. No real fight can be made until a distinct line is drawn between the opposing forces."

"Taxation should be for revenue only. Taxation of the many for the benefit of the few is robbery under the form of law, whether it is invoked to aid the manufacturers of the East or the producers of raw material in the West and South."

"Tariff reform by the friends of protection has turned out to be a fraud. Tariff reform by protectionist Democrats would be just as disappointing. Tariff reform by the friends of the tariff is impossible. Tariff reform by the enemies of high tariff is not only reasonable but necessary."

—Governor Hughes has devoted the week to his campaign for direct primaries and against bossism. At Syracuse, before 1,500 voters, he said:

"What we are really seeking to accomplish is to deprive certain persons not of power which properly belongs to them, but of misused power, by reason of a ready control of machinery. By direct nominations I mean that system by which party candidates for office are chosen by the direct vote of the enrolled party voters. I believe in that system, because it seems to me it conserves best a fundamental principle. The party voters are entitled to say who their representatives shall be, for they constitute the party."

The worst flood in years visited the city of Monterey, in Northern Mexico, last Friday and Saturday, and as a result over 1,000 are reported dead, 10,000 are homeless, and at least \$10,000,000 worth of property has been destroyed. The flood was the result of a cloudburst above the city on the San Luis River. The section of the city where the poor people live was inundated by the flood. All the bridges were swept away and many of the survivors only escaped by floating off on their frail houses and furniture. Arambarrie street, in the center of the town, was turned into a swollen river and many lives were lost there, and even large warehouses in the vicinity were destroyed. The latest advices say that the city authorities are well organized for relief and have taken charge of all bakeries and grocery stores to prevent famine. The city is at present cut off from all outside communication, and it will take days to restore railroad communication and hence to be able to get supplies. Pestilence is greatly feared.—The contest for the Vice-Presidency in Mexico is the most interesting event in politics at present. As the Vice-President is most likely to be President when Diaz, who is eighty years old, retires, there are several strong candidates. General Reyes, Governor of Nuevo Leon, is said to be the most active contender. As he is not the choice of President Diaz, troops have been sent to watch him, until now there is a general willingness on the part of his followers to admit his defeat. Of course, the Administration will not admit it is using its vast power to crush him, but such is undoubtedly the case.

The Rheims Aviation Contest

The chief prize of the international meet at Rheims, the James Gordon Bennett Cup for the fastest flight of twenty kilometers, was won for the Aero Club of America by Glenn H. Curtiss, the only American contestant. The race was twice around the course at any time between 10 a. m. and 5:30 p. m. Curtiss started out soon after 10 o'clock and made the distance, 12.42 miles, in 11 minutes, 50 $\frac{2}{3}$ seconds. He rose at every turn to a height of 100 feet and came down the long stretches of the course with the added force of gravity, crossing the line finally close to the ground. During the day the French aviators made repeated efforts to beat this record but in vain. The nearest were Louis Bleriot, 15 minutes, 56 $\frac{1}{2}$ seconds; Hubert Latham, 17 minutes, 32 seconds; and M. Lefebvre, 20 minutes, 47 $\frac{2}{3}$ seconds. Curtiss received also a cash prize of \$5,000, and his victory will bring the international competitions to America next year, probably to be held under the auspices of the Aero Club on Long Island.—The Grand Champagne Prize of \$10,000 for the longest flight was won by Henri Farman, who made eighteen rounds of the course (about 112 miles) in 3 hours, 4 minutes, 56 $\frac{2}{5}$ seconds. For duration and speed this flight was quite unprecedented and unexpected. He stopped only on account of the darkness and made another round after the judges had called time according to the rules at 7:30 o'clock. His nearest rivals were Latham, 96 miles, and Paulhan, 81 miles.—Farman made a new record for passenger service by carrying two men around the course in ten and a half minutes.—The prize for the greatest altitude reached was won by Latham in his monoplane, reaching the height of 155 meters (about 500 feet). Farman was next with 110 meters.—On the last day of the meet Curtiss again took the speed prize for a course three times around the ring in 24 minutes, 15 $\frac{1}{5}$ seconds. Bleriot on the same day narrowly escaped injury for his motor stopped when he was fifty feet up and his monoplane fell instantly to the ground, turning over three times and taking fire from the blazing gasoline. He was slightly burned about the face and hands.—The week at Rheims was a series of wonderful demonstrations of

the completeness of man's conquest of the air. New records were made and broken every day, and the safety of the flying machines was as remarkable as their efficiency. Altho there were several accidents and wrecked machines no one was injured. Flights were made

THE FARMAN AEROPLANE

Which won the grand prize for duration at the meet at the Rheims meet

during rain and when the wind was blowing 25 miles an hour. Some parts of the course were very gusty but this

caused no serious inconvenience to the aviators. The contest did not settle the question of which is the best machine for all types did well, the Wright, Curtiss and Voisin biplanes and the Bleriot and Antoinette monoplanes. The power and reliability of the motor seem to be the most important factors.—Germany does not propose to be left behind in aeronautics and the arrival of Count Zeppelin at Berlin in his dirigible coincided with the closing of the French contest. He received a royal welcome. The roofs, streets and parks of the capital swarmed with people, cheering and singing, as the airship passed up Unter den Linden and sailed around the palace and cathedral. It landed in the Tempelhof parade ground, where the Emperor, Empress and leading officials were gathered to receive the aged Count. The Emperor had invited Orville Wright to join his party and introduced him to Count Zeppelin.

British Legislation Premier Asquith, in stating the Government program to the House of Commons on August 20, announced that twelve of the Government bills would be dropped on account of lack of time to discuss them during the present session. Of these the only one of general interest and importance is the bill for the disestablishment of the Church in Wales. Failure to pass this will be a considerable disappointment to the Nonconformists. Three bills of controversial character which the Government will insist upon passing are, first and foremost, the Finance bill, next the Irish Land bill, and third, the London Elections bill. Other important Government measures which are expected to meet with less opposition are those providing for the reorganization of the navy and the co-operation of the colonies in imperial defense. — The only serious objection that was brought against the South African Constitution was in regard to the clause that a senator must be "a British subject of European descent." No one attempted to defend this provision in principle, but it was argued that to amend it would be to offend the South Africans, who had achieved a remarkable success in coming to an agreement upon the document as it stands, and would cause the disappoint-

ment or abandonment of the accomplishment of the union. Mr. Asquith argued that on the whole it was a gain for the natives, since the 20,000 who were now upon the register in Cape Colony would have the right, so far as votes go, to determine the legislation and policy of South Africa as a whole. Eligibility to sit in the new union Parliament would be purely nominal, for in the fifty-five years during which the native franchise has been in existence in Cape Colony, there has not been a single instance of a native having been returned to the Cape legislature. Both the Government and the Opposition speakers plainly express their regret at the inclusion of a clause discriminating against the colored race, and the hope that South Africans might see fit to eliminate it of their own free will in the future. Vehement protests were, however, voiced against such a violation of English principles of fair play, and the wording of the clause was criticized as vague and impossible of satisfactory interpretation. Natives of India have sat in the British Parliament, but would not be deemed sufficiently high in the scale of the human family for the Parliament of South Africa. The words "A British subject of European descent" would, if literally applied, exclude Australians and New Zealanders.—Madra Lal Dhingri, the Hindu assassin of Sir Curzon-Wyllie, after having been found guilty of murder in a trial of only one hour's length, was promptly hanged. Dublin and other parts of Ireland were placarded with a poster bearing the following inscription in large type: "Ireland honors Madra Lal Dhingri, who was proud to lay down his life for the cause of his country."

China and Japan China and Japan have come to an agreement not merely in regard to the reconstruction of the Antung-Mukden Railroad, but also as to the other questions which have been under dispute. The settlement seems to be the result of bargaining and mutual concessions. Japan relinquishes her claim to the Chientai territory, lying to the north of Korea on the other side of the Tamen River. When Japan assumed control of Korea she revived an ancient and disputed claim to Korean supremacy over that district,

and placed her officials in charge of the Koreans who reside there and form a considerable proportion of the population. The legal rights depend upon the interpretation of the inscription on one of the ancient boundary monuments, but, while acknowledging China's political and administrative right to Chentao, Japan has conceded the right to maintain six open markets in that district and to have jurisdiction over the Koreans in these places. Japan also obtains concessions to the coal mines of Fushan and Yentai, which, however, are to remain under the jurisdiction of China, Japan agreeing to pay royalties and taxes. The mines in the railroad zone are to be under joint management. Japan obtained the right to extend the Tashi Chiao Railroad to Yinkow. China agrees not to construct the Hsinmintun - Fakumen Railroad against the wishes of Japan, but does not admit the principle of Japan's right to veto the Manchurian railroads in general. On the whole, it looks as tho the settlement was a practical surrender on the part of China to the Japanese demands, for Japan has given up merely her shadowy title to Chien-tao.—The demand of our Government that American financiers be permitted to share in the loan for the construction of the Hankow-Szechuen Railroad has met with acquiescence on the part of China and the British, German and French investors. The United States is to be allotted a quarter of the loan, which is to be increased from \$27,500,000 to \$30,000,000. Americans are to have equal opportunity to supply material for both the Sze-chuen and the Canton lines and the branches; they will appoint subordinate engineers, and they will have also one-half of all future loans of the Sze-chuen Railroad and its branches, with the corresponding advantages.

Turkey and Greece The Turkish Government has declared its satisfaction with the latest assurances received from Greece as to their non-interference with affairs in Crete, and has thanked the Powers for their settlement of the Cretan difficulty and the removal of the Greek flag from the fortress at Canea. Turkey also urges the Powers to make a definite settlement of the status of

Crete. The Russian Government has also suggested that the time was ripe for the Powers to take up the whole subject of the Eastern question, but the suggestion is not likely to meet with the general approval, most of the Powers, including Turkey, being really content to leave the questions in their present state. The moderate and conciliatory policy of the Greek Government in this affair has offended the Greek people, especially the army and navy. The Rhallis Ministry, which came into power only a month ago, has been deposed by a mutiny in Athens. The ostensible cause of the dissatisfaction of the officers was tardiness and favoritism in the matter of promotions, but the real underlying motive of the movement was the disapproval of the peaceful solution of the Cretan difficulty. A deputation of army and navy officers called upon the Prime Minister for the purpose of remonstrance and petition for the reorganization of the military system, but M. Rhallis refused to receive them on the ground that the deputation included officers who had been punished for subordination. On their return to the barracks, a large part of the garrison, including 548 officers and about 3,000 soldiers, left their quarters and marched out of the city, establishing a camp in the suburbs. The King thereupon accepted the resignation of Premier Rhallis and asked M. Mavromichaelis to form a new ministry. A proclamation of amnesty was issued to the mutinous troops, and condescendingly accepted by the insurgent leaders. One of the reforms insisted upon is the removal of the Crown Prince and other members of the royal family from positions of authority in the army.—Trouble has arisen for the Turkish Government in two quarters, the northwest and the southeast of the Empire. The Albanians who were temporarily pacified are again in revolt and severe fighting has taken place. Niazi Bey has been ordered to the front with another battalion. The Mahdist movement in Yemen, Southwestern Arabia, has been quiescent for a year or two, but is now reported to have again broken out. The Ottoman troops have been defeated and the Governor has appealed to Constantinople for protection. Twelve thousand troops are to be dispatched from Constantinople to put down the rebellion.

The Sowing of the Germ

BY FREDERICK B. WATERS

As, eons back,
The life-germ past
On endless track
Thru spaces vast,
On virgin star
By fate enwhirled,
It found a waste
And sired a world.

So, from God's throne,
The life-germ came
Which, by Him sown,
And thru His name,
In desert wastes
Of sin and vice,
Shall make of them
A paradise.

In the Land of the Free

BY SUI SIN FAR

[Our readers will recall the autobiography of Sui Sin Far in our issue of January 1904 entitled "Leaves from the Mental Portfolio of an Eurasian." Tho the following article is cast in the form of fiction, we are obliged to confess it is the fiction that is often less strange and cruel than the truth.—EDITOR.]

I.

"SEE, Little One—the hills in the morning sun. There is thy home for years to come. It is very beautiful and thou wilt be very happy there."

The Little One looked up into his mother's face in perfect faith. He was engaged in the pleasant occupation of sucking a sweetmeat; but that did not prevent him from gurgling responsively.

"Yes, my olive bud; there is where thy father is making a fortune for thee. Thy father! Oh, wilt thou not be glad to behold his dear face. 'Twas for thee I left him."

The Little One ducked his chin sympathetically against his mother's knee. She lifted him on to her lap. He was two years old, a round, dimple-cheeked boy with bright brown eyes and a sturdy little frame.

"Ah! Ah! Ah! Ooh! Ooh! Ooh!" puffed he, mocking a tugboat steaming by.

San Francisco's water front was lined with ships and steamers, while other craft, large and small, including a couple of white transports from the Philippines, lay at anchor here and there off shore. It was some time before the "Eastern Queen" could get docked, and even after that was accomplished, a lone Chinaman who had been waiting on the wharf for an hour was detained that much longer by men with the initials U. S. C. on their caps, before he could board the steamer and welcome his wife and child.

"This is thy son," announced the happy Lae-Choo.

Hom Hing lifted the child, felt of his little body and limbs, gazed into his face with proud and joyous eyes; then turned inquiringly to a customs officer at his elbow.

"That's a fine boy you have there," said the man. "Where was he born?"

"In China," answered Hom Hing, swinging the Little One on his right shoulder, preparatory to leading his wife off the steamer.

"Ever been to America before?"

"No, not he," answered the father with a happy laugh.

The customs officer beckoned to another.

"This little fellow," said he, "is visiting America for the first time."

The other customs officer stroked his chin reflectively.

"Good day," said Hom Hing.

"Wait!" commanded one of the officers. "You cannot go just yet."

"What more now?" asked Hom Hing.

"I'm afraid," said the first customs officer, "that we cannot allow the boy to go ashore. There is nothing in the papers that you have shown us—your wife's papers and your own—having any bearing upon the child."

"There was no child when the papers were made out," returned Hom Hing. He spoke calmly; but there was apprehension in his eyes and in his tightening grip on his son.

"What is it? What is it?" quavered

Lae Choo, who understood a little English.

The second customs officer regarded her pityingly.

"I don't like this part of the business," he muttered.

The first officer turned to Hom Hing and in an official tone of voice, said:

"Seeing that the boy has no certificate entitling him to admission to this country, you will have to leave him with us."

"Leave my boy," exclaimed Hom Hing.

"Yes; he will be well taken care of and just as soon as we can hear from Washington he will be handed over to you."

"But," protested Hom Hing, "he is my son."

"We have no proof," answered the man with a shrug of his shoulders, "and even if so, we cannot let him pass without orders from the Government."

"He is my son," reiterated Hom Hing, slowly and solemnly. "I am a Chinese merchant and have been in business in San Francisco for many years. When my wife told to me one morning that she dreamed of a green tree with spreading branches and one beautiful red flower growing thereon, I answered her that I wished my son to be born in our country, and for her to prepare to go to China. My wife complied with my wish. After my son was born, my mother fell sick and my wife nursed and cared for her; then my father, too, fell sick, and my wife also nursed and cared for him. For twenty moons my wife care for and nurse the old people, and when they die, they bless her and my son, and I send for her to return to me. I had no fear of trouble. I was a Chinese merchant and my son was my son."

"Very good, Hom Hing," replied the first officer. "Nevertheless, we take your son."

"No, you not take him; he my son, too."

It was Lae Choo. Snatching the child from its father's arms, she held and covered it with her own.

The officers conferred together for a few moments; then one drew Hom Hing aside and spoke in his ear.

Resignedly Hom Hing bowed his head, then approached his wife. "'Tis the

law," said he, speaking in Chinese, "and 'twill be but for a little while—until tomorrow's sun arises."

"You, too," reproached Lae Choo in a voice eloquent with pain. But accustomed to obedience, she yielded the boy to her husband, who in turn delivered him to the first officer. The Little One protested lustily against the transfer; but his mother covered her face with her sleeve and his father silently led her away. Thus was the law of the land complied with.

II.

Day was breaking. Lae Choo, who had been awake all night, dressed herself, then awoke her husband.

"'Tis the morn," she cried, "Go, bring our son."

The man rubbed his eyes and arose upon his elbow so that he could see out of the window. A pale star was visible in the sky. The petals of a lily in a bowl on the window sill were unfurled.

"'Tis not yet time," said he, laying his head down again.

"Not yet time. Ah, all the time that I lived before yesterday is not so much as the time that has been since my little one was taken from me."

The mother threw herself down beside the bed and covered her face.

Hom King turned on the light and touching his wife's bowed head with a sympathetic hand inquired if she had slept.

"Slept!" she echoed, weeping, "Ah, how could I close my eyes with my arms empty of the little body that has filled them every night for more than twenty moons. You do not know—man—what it is to miss the feel of the little fingers and the little toes and the soft round limbs of your little one. Even in the darkness, his darling eyes used to shine up to mine and often have I fallen into slumber with his pretty babble at my ear. And now, I see him not—I touch him not; I hear him not. My baby, my little fat one!"

"Now! Now! Now!" consoled Hom Hing, patting his wife's shoulder reassuringly; "there is no need to grieve so; he will soon gladden you again. There cannot be any law that would keep a child from its mother!"

Lae Choo dried her tears.

"You are right, my husband," she meekly murmured. She arose and stepped about the apartment setting things to rights. The box of presents she had brought for her California friends had been opened the evening before; and silks, embroideries, carved ivories, ornamental lacquer ware, brasses, camphor wood boxes, fans and china-ware were scattered around in confused heaps. In the midst of unpacking, the thought of her child in the hands of strangers had overpowered her—and she had left everything to crawl into bed and weep.

Having arranged her gifts in order she stepped out on to the deep balcony.

The star had faded from view and there were bright streaks in the Western sky. Lae Choo looked down the street and around. Beneath the flat occupied by her and her husband were quarters for a number of bachelor Chinamen, and she could hear them from where she stood, taking their early morning breakfast. Below their dining room was her husband's grocery store. Across the way was a large restaurant. Last night it had been resplendent with gay colored lanterns and the sound of music. The rejoicings over "the completion of the moon" by Quong Sum's first born had been long and loud, and had caused her to tie a handkerchief over her ears. She, a bereaved mother, had it not in her heart to rejoice with other parents. This morning, the place was more in accord with her mood. It was still and quiet. The revelers had dispersed or were asleep.

A roly-poly woman in black sateen, with long pendant earrings in her ears, looked up from the street below and waved her a smiling greeting. It was her old neighbor, Kuie-hoe, the wife of the gold embosser, Mark Sing. With her was a little boy in yellow jacket and lavender pantaloons. Lae Choo remembered him as a baby. She used to like to play with him in those days when she had no child of her own. What a long time ago that seemed! She caught her breath in a sigh, and laughed instead.

"Why are you so merry?" called her husband from within.

"Because my Little One is coming

home," answered Lae Choo. "I am a happy mother—a happy mother."

She pattered into the room with a smile on her face.

* * * * *

The noon hour had arrived. The rice was steaming in the bowls and a fragrant dish of chicken and bamboo shoots was awaiting Hom Hing. Not for one moment had Lae Choo paused to rest during the morning hours; her activity had been ceaseless. Every now and again, however, she had raised her eyes to the gilded clock on the curiously carved mantelpiece. Once, she had exclaimed:

"Why so long, Oh, why so long?" Then apostrophizing herself: "Lae Choo, be happy. The Little One is coming! The Little One is coming!" Several times she burst into tears and several times she laughed aloud.

Hom Hing entered the room; his arms hung down by his side.

"The Little One!" shrieked Lae Choo.

"They bid me call tomorrow."

With a moan the mother sank to the floor.

The noon hour passed. The dinner remained on the table.

III.

The winter rains were over; the spring had come to California, flushing the hills with green and causing an ever changing pageant of flowers to pass over them. But there was no spring in Lae Choo's heart, for the Little One remained away from her arms. He was being kept in a mission. White women were caring for him, and tho for one full moon he had pined for his mother and refused to be comforted, he was now apparently happy and contented. Five moons or five months had gone by, since the day he had passed with Lae Choo thru the Golden Gate; but the great Government at Washington still delayed sending the answer which would return him to his parents.

* * * * *

Hom Hing was disconsolately rolling up and down the balls in his abacus box when a keen-faced young man stepped into his store.

"What news?" asked the Chinese merchant.

"This!". The young man brought

forth a typewritten letter. Hom Hing read the words:

"Re Chinese child, alleged to be the son of Hom Hing, Chinese merchant, doing business at 425 Clay street, San Francisco.

"Same will have attention as soon as possible."

Hom Hing returned the letter and without a word continued his manipulation of the counting machine.

"Have you anything to say?" asked the young man.

"Nothing. They have sent the same letter fifteen times before. Have you not yourself showed it to me?"

"True!" The young man eyed the Chinese merchant furtively. He had a proposition to make and he was pondering whether or not the time was opportune.

"How is your wife?" he inquired solicitously—and diplomatically.

Hom Hing shook his head mournfully.

"She seems less every day," he replied. "Her food she takes only when I bid her and her tears fall continually. She finds no pleasure in dress or flowers and cares not to see her friends. Her eyes stare all night. I think, before another moon, she will pass into the land of spirits."

"No!" exclaimed the young man, genuinely startled.

"If the boy not come home I lose my wife sure," continued Hom Hing with bitter sadness.

"It's not right," cried the young man, indignantly. Then he made his proposition.

The Chinese father's eyes brightened exceedingly.

"Will I like you to go to Washington and make them give you the paper to restore my son?" cried he. "How can you ask when you know my heart's desire?"

"Then," said the young fellow, "I will start next week. I am anxious to see this thing thru if only for the sake of your wife's peace of mind."

"I will call her. To hear what you think to do will make her glad," said Hom Hing.

He called a message to Lae Choo upstairs thru a tube in the wall.

In a few moments she appeared, listless, wan and hollow-eyed; but when her husband told her the young lawyer's suggestion, she became as one electrified; her form straightened, her eyes glist-

ened; the color flushed to her cheeks. "Oh," she cried, turning to James Clancy, "You are a hundred man good!"

The young man felt somewhat embarrassed; his eyes shifted a little under the intense gaze of the Chinese mother.

"Well, we must get your boy for you," he responded. "Of course"—turning to Hom Hing—"It will cost a little money. You can't get fellows to hurry the Government for you without gold in your pocket."

Hom Hing stared blankly for a moment. Then: "How much do you want, Mr. Clancy?" he asked quietly.

"Well, I will need at least five hundred to start with."

Hom Hing cleared his throat.

"I think I told to you the time I last paid you for writing letters for me and seeing the custom boss here that nearly all I had was gone!"

"Oh, well then, we won't talk about it, old fellow. It won't harm the boy to stay where he is, and your wife may get over it all right."

"What that you say?" quavered Lae Choo.

James Clancy looked out of the window.

"He says," explained Hom Hing in English, "that to get our boy we have to have much money."

"Money! Oh, yes."

Lae Choo nodded her head.

"I have not got the money to give him."

For a moment Lae Choo gazed wonderingly from one face to the other, then comprehension dawning upon her; with swift anger, pointing to the lawyer, she cried: "You not one hundred man good; you just common white man."

"Yes, ma'am," returned James Clancy, bowing and smiling ironically.

Hom Hing pushed his wife behind him and addressed the lawyer again: "I might try," said he, "to raise something; but five hundred—it is not possible."

"What about four?"

"I tell you I have next to nothing left and my friends are not rich."

"Very well!"

The lawyer moved leisurely toward the door, pausing on its threshold to light a cigarette.

"Stop, white man; white man, stop!"

Lae Choo, panting and terrified, had started forward and now stood beside him, clutching his sleeve excitedly.

"You say you can go to get paper to bring my Little One to me if Hom Hing give you five hundred dollars?"

The lawyer nodded carelessly; his eyes were intent upon the cigarette which would not take the fire from the match.

"Then you go get paper. If Hom Hing not can give you five hundred dollars—I give you perhaps what more that much."

She slipped a heavy gold bracelet from her wrist and held it out to the man. Mechanically he took it.

"I go get more!"

She scurried away, disappearing behind the door thru which she had come.

"Oh, look here, I can't accept this," said James Clancy, walking back to Hom Hing and laying down the bracelet before him.

"It's all right," said Hom Hing, seriously, "pure China gold. My wife's parent give it to her when we married."

"But I can't take it anyway," protested the young man.

"It is all same as money. And you want money to go to Washington," replied Hom Hing in a matter of fact manner.

"See, my jade earrings—my gold buttons—my hair pins—my comb of pearl and my rings—one, two, three, four, five rings; very good—very good—all same much money. I give them all to you. You take and bring me paper for my Little One."

Lae Choo piled up her jewels before the lawyer.

Hom Hing laid a restraining hand upon her shoulder. "Not all, my wife," he said in Chinese. He selected a ring—his gift to Lae Choo when she dreamed of the tree with the red flower. The rest of the jewels he pushed toward the white man.

"Take them and sell them," said he. "They will pay your fare to Washington and bring you back with the paper."

For one moment James Clancy hesitated. He was not a sentimental man; but something within him arose against accepting such payment for his services.

"They are good, good," pleadingly asserted Lae Choo, seeing his hesitation.

Whereupon he seized the jewels, thrust them into his coat pocket and walked rapidly away from the store.

IV.

Lae Choo followed after the missionary woman thru the mission nursery school. Her heart was beating so high with happiness that she could scarcely breathe. The paper had come at last—the precious paper which gave Hom Hing and his wife the right to the possession of their own child. It was ten months now since he had been taken from them—ten months since the sun had ceased to shine for Lae Choo.

The room was filled with children—most of them wee tots, but none so wee as her own. The mission woman talked as she walked. She told Lae Choo that little Kim, as he had been named by the school, was the pet of the place, and that his little tricks and ways amused and delighted every one. He had been rather difficult to manage at first and had cried much for his mother; "but children so soon forget, and after a month he seemed quite at home, and played around as bright and happy as a bird."

"Yes," responded Lae Choo, "Oh, yes, yes!"

But she did not hear what was said to her. She was walking in a maze of anticipatory joy.

"Wait here, please," said the mission woman, placing Lae Choo in a chair. "the very youngest ones are having their breakfast."

She withdrew for a moment—it seemed like an hour to the mother—then she reappeared leading by the hand a little boy dressed in blue cotton overalls and white soled shoes. The little boy's face was round and dimpled and his eyes were very bright.

"Little One, ah, my Little One!" cried Lae Choo.

She fell on her knees and stretched her hungry arms toward her son.

But the Little One shrunk from her and tried to hide himself in the folds of the white woman's skirt.

"Go 'way, go 'way!" he bade his mother,

Some Lessons of the Recent War Game

BY EDWIN EMERSON

[Mr. Emerson was a member of Colonel Roosevelt's Rough Riders in the Spanish-American War, took part in the Colombian-Venezuelan War in 1901 as Venezuelan colonel of volunteers and was decorated by President Castro with the Order of Bolivar for gallantry in action. He was also war correspondent in Manchuria during the Russo-Japanese War, and has written much on military affairs. He was a faithful follower of the fortunes of war last week during the time that tried men's souls in the siege of Boston.—EDITOR.]

THAT was an unfortunate comparison invited by General Leonard Wood when he likened the recent war game near Boston to a possible invasion of American soil by a German army. Such comparisons of the fighting

on a far larger scale ever since the Franco-Prussian War thirty-eight years ago.

If there was one thing that was shown more clearly than anything else during our recent army maneuvers it was that

REGIMENT ASSEMBLING FOR THE MASSACHUSETTS WAR GAME.

forces of two friendly nations are always odious. In this instance the comparison was quite idle in view of the fact that most of the troops engaged in the war game were National Guardsmen unaccustomed to field operations; whereas all German forces under arms are part of a huge conscript army which has been seasoned by regular annual field maneuvers

a foreign army of invaders, particularly a German column, would have done things differently and without stronger resistance would have struck Boston sooner. For one thing they would have landed their forces nearer to their objective point; they would have had more cavalry and field artillery at their disposal; all the invading forces would have

marched harder and further, particularly on the two first days of the campaign when the weather was fair, the roads in good condition and unobstructed for a considerable distance by the defending forces. On these two days the main column of General Bliss's invading Red Army only covered a few miles, held up

marches, all-day marches, large flanking movements or with any of those logical developments of far-extended military forces which require more time for their successful accomplishment.

None of these conditions would have applied to real war. It is fair to assume, therefore, that any invading force of

SEVENTH REGIMENT OF NEW YORK ESTABLISHING CAMP

apparently by delays in the arrival of transports and in the unpacking of supplies, which recalled some of our army experiences during the Spanish-American War. Then, when the Red Army was at last ready to strike, came a deluge of rain, lasting two days and two nights, which softened all the roads, soaked the men and their supplies and made everything more difficult and slower.

Everything was further retarded by one half owing to the time limit fixed by the umpires in the war game which stopped all hostile operations or strategic marches at one o'clock sharp on each day, while it was forbidden to make up for this shortening in time by starting any hostile operations before five each morning. This did away with any night

equal strength would have got twice or three times as far within the same six days, unless they had suffered a far more decisive check by the defenders than that inflicted by the Massachusetts militiamen on the Red Army.

During these New England maneuvers the farthest distances covered by single marches did not exceed fifteen or sixteen miles. During our Civil War, it will be recalled, there were frequent forced marches by night and in rainy weather over worse roads, covering forty miles. During the recent wars, excepting only the Cuban campaign, similarly long distances have been covered. Yet, during these recent maneuvers, there was much complaint of men getting footsore and unable to follow their commands. This

merely proves that they were not seasoned soldiers, as was to be expected indeed from city-bred men who had only just left their comfortable homes.

To understand the lessons of this war game aright it is necessary to have a full understanding of what was the problem involved and what were the forces engaged on either side. Roughly speaking, each of the opposing armies numbered about 10,000 men. On the defending side they were all militiamen from Massachusetts, aided in small part by some of the regular Coast Artillery. This force was woefully deficient in cavalry, and also in field artillery; but on the other hand they had the advantage of operating in their own country, among country folk who sympathized with them

There were also the full newspaper reports scattered broadcast among the troops by press automobiles. Speaking of automobiles, the Blue Army also had the advantage of a small battery of machine guns mounted on auto trucks, screened with green branches, which proved a formidable weapon in outlying points and for the defense of columns of infantry and cavalry retiring along the roads in compact order.

On the other side, with the Red Army, there were some of the crack commands of the New York Militia—acknowledged to be the best in the National Guard—such as the Seventh Infantry, Squadron A, the First Battery Battalion of Field Artillery, and the Twenty-second Engineers, besides other regiments and forces

MOVING CAMP.

One of the problems of the war game.

and gave them information at every point which was more accurate than could have been possible in war time by the untrammelled movements of civilians and newspaper reporters between the lines; by the fact that the telephone wires were all in good working order; and by the unprecedented use of automobiles running back and forth between the lines.

from Connecticut, New Jersey and the District of Columbia, aided by several troops of the regular cavalrymen from the Tenth Colored Regiment, now stationed in New England.

The country over which this mimic war was fought was level—too level, in fact, for good artillery ranges—but it was so interspersed with lakes and ponds

and swamps as to render the military terrain fairly difficult and confusing, but for the serviceable military maps furnished by the War Department.

As is apt to be the case in maneuvers,

were held up unduly, resulting in considerable suffering for men and beasts. One battery with which I rode during the maneuvers, for instance, found itself without water for the greater part of two

THE AUTOMOBILE COMMISSARY DEPARTMENT

A part of the equipment of the army of invasion, Massachusetts war game

the opposing forces, thanks to the blank cartridges used by their firing lines, came ludicrously close together—near enough to come to blows in some instances—and the defenders, tho frequently outnumbered and outflanked, showed a disposition to stand their ground far longer than would have been possible in actual warfare, yielding only after vociferous squabbles among the umpires on both sides; most of whom were regular army officers. This condition of affairs made for further delays. While the umpires were arguing between the two firing lines as to who should be declared “dead” and who “taken,” the advance of whole columns would be held up and the supporting columns in the rear squatted idly on the ground, wondering what was doing at the front. This again obstructed the roads in the rear so that the supply wagons carrying food, forage and water

days and a night, during the very time when the work was heaviest, causing undue hardship to their city horses, accustomed to being watered at regular hours twice or three times a day.

On the whole, tho, there was little complaint on the part of the men who were thus roughing it. Personally, I thought it unnecessary to let the troops engage in their first battle, which proved to be the biggest and most important engagement, after a night of heavy rain and at a time when the rain was still falling in torrents. Even the most seasoned soldiers do not relish sleeping out in the wet or flopping down on their stomachs in marshes and puddles when the bugle calls for skirmishing order. During my own campaigning days in Cuba, in Manchuria and South America, I can recall very few instances when military commanders went out of their way to seek

battle under such unpropitious weather. Even the great Napoleon stayed the Battle of Waterloo until the sun had come out and dried the soaked field over which he purposed to move his cavalry and guns.

It was also Napoleon who said that: "Wars are won by the legs." This recent "war" was certainly not won by the legs. At the time when the Red troops had just disembarked and lay waiting under arms for many tedious hours in the town of New Bedford, from the outskirts of which they did not succeed in emerging that first day, I could not help recalling how different were the experiences of Leonard Wood, the Chief Umpire, ten years ago, during those first days of the Cuban campaign, when his command, having debarked within a few hours, were immediately marched into the enemy's country, where we fought and won the first battle in the land campaign only a few hours afterward.

The long delay at New Bedford was caused in large measure, so it was explained, by the belated arrival of some of the transports. Some of the commands, instead of being preserved as units, were moved in separate transports. The field artillery battalion with which I traveled, for instance, had its officers and men on one ship, while their horses, guns, caissons and battery wagons, with but a small detail of men to handle them, traveled on another ship. Worse than this was the manner in which the independent cavalry was moved. Major Bridgman, who commanded this column, confest to me that he had been ordered to ship his officers and men in one ship, his horses in another, and their equipments in a third. This is contrary to all good military usage, for very obvious reasons. Had any one of these three ships run on

a sandbar or fallen under some other mishap of war, all the cavalry and artillery of the Red Army would have been rendered useless, and General Bliss would have found his invading column crippled at its most effective point for purposes of initiative from the very outset.

Later, when the troops were shipped home, the same blunders were repeated. Again the units were separated. Again there were unnecessary delays. Again the troops were routed out at daybreak to march a few miles, after which they lay under arms idly waiting many tedious hours for ships and trains that were not ready. The artillery battalion, with which I rode, at the end of hostilities close to Boston were not marched straight to Boston to embark there for home, as would have been the easiest way, but were ordered instead to march to a railroad station nearly as far as Boston, where they entrained for Fall River, where the transports lay. This meant the double work of entraining, detraining, embarking and debarking all these horses, field pieces, caissons, wagons and men—the hardest work in the artillery service—and wholly unnecessary.

Yet, all this transportation of the troops and their supplies, with all the problems connected with their shipments, was managed by the regular army officers.

Can it be that our War Department and regular military establishment has not derived more benefit from the lessons afforded by our long military occupation of the Philippines? Is our War Department like those Bourbons of whom Napoleon said so scornfully: "They have forgotten nothing, true; but they have also learned nothing."

NEW YORK CITY.

GREAT AMERICAN UNIVERSITIES—IX.

The Daily Illini.

UNIVERSITY *of* ILLINOIS

by EDWIN E. SLOSSON

THE SCRIBBLER

THESE articles, being concerned only with the present and future of the greater American universities, contain as few references to the past as possible. In this instance, however, it seems desirable to go back a bit and mention an event that had a decisive influence on higher education in this country. I refer to the Glacial Epoch. The great ice sheets which covered the northeastern portion of the United States modified the configuration and composition of the land and so in a measure determined, not merely what crops should be grown and what industries should thrive, but even such remote and refined things as what studies should be pursued and what books read and written. Inside the gla-

cial boundary the average thickness of the subsoil is about a hundred feet. Outside it is about five feet.' This means that agriculture in the one case has a reserve fund of twenty times the other. The importance and far-reaching influence of this factor on our civilization may be seen by a glance thru the Statistical Atlas of the United States, published in the census report, and a comparison with a geological chart of the Pleistocene Period. On many of the maps, such as those giving the density of population, especially white and foreign-born, the number of cities supported, the value of land and its produce, the value of manufactured products, and the degree of literacy, the glaciated area is clearly indicated. In Europe similar effects are shown in various ways. For example, the rising flood of the Protestant Ref-

ormation was checked at the terminal moraine.

The glaciated area of the United States, which is, roughly, New England, New York, the northern part of Pennsylvania and the region embraced by the arms of the Ohio and Missouri Rivers, contains most of the important universities of the United States. About three-fourths of the college students are comprised within this district, which is less than a fourth of the total area of the United States. Of the institutions accepted by the Carnegie Foundation 87 per cent. are in the glaciated region. Of the 3,471 Ph.D. degrees granted during the period 1898-1909, 79 per cent. were from glaciated universities, 85 per cent., if we exclude Johns Hopkins.

In the production of men of genius the glaciated area shows the same superiority over the rest of the country as in the production of wheat. Seventy-six per cent. of those in the Hall of Fame of New York University, 89 per cent. of Professor Cattell's one thousand eminent men of science, 66 per cent. of his eminent Americans in general,² 70 per cent. of the names selected for the National Institute of Arts and Letters, 85 per cent. of the members of the National Academy of Science come from the glaciated area. These figures have no definite value. They are merely rough calculations from such data as I have at hand, but they are sufficient to illustrate the point. A serious study of the question—which some aspirant for the doctorate in sociology might well undertake—would have to take into consideration the many other controlling factors, both human and geological, such as heredity, legislation, climate, the location of cities on alluvial deposits and the varied effects of glaciation on soil formation.

I introduce it here merely to call attention to the exceptional position of the University of Illinois, which must provide for the needs of both a glaciated and a non-glaciated population. The State was plowed over for hundreds of thousands of years by the two great ice sheets originating respectively in Labrador and to the west of Hudson Bay, 1,500 miles away. The lines of their ebb and flow

can be traced on demographic charts as well by the dikes and mounds they left as ripple marks on the land. Here the glaciation reached a more southerly point than anywhere else in America, extending almost to the southern boundary of the State, and leaving only a few counties in the tip untouched. This driftless area is commonly called "Egypt" by those who live elsewhere, tho the term is sometimes used to include the whole region below the southern line of the second great ice invasion of 20,000 to 60,000 years ago, which was more important in its effects on Illinoisian history.

The terminal moraine of this loops around the University of Illinois about forty miles to the southward. Land just inside of it sells for three times as much as land outside,³ and I presume it would be possible for a professor in the University to pick out the glaciated from the non-glaciated examination papers. I did not have an opportunity, however, of putting this to an experimental test.

But whatever the validity of these speculations, for which the University of Illinois is in nowise responsible, the policy of the University is dictated by its position. The aim of our legislation is to promote uniformity. All of the States receive the same educational subsidies from the Federal Government, altho one State may do a thousand times as much good with the money as some other. Inside a State the school authorities do their best to equalize educational opportunities. This is especially the function of a State university as the head of the public school system. Degrees of latitude make a greater difference in the character of the people than do degrees of longitude. The University of Illinois has a north and south range equal to that between Boston and Richmond or Leipzig and Venice. It must keep in touch with both Chicago and "Egypt," and render equal service to its two masters. Altho the researches of Galton and others have shown that the production of genius is no miracle, but is subject to the same laws of heredity and environment as anything else, this should not lead to

²For further examples on the effects of glaciation on the character of peoples, see "A Case of Geographic Influence on Human Affairs," by G. D. Hubbard, of Cornell, in the *Transactions of the American Geographical Society*, XXXVI, 145.

³*Science*, November, 1906, and August 13, 1908.

a scientific fatalism. The greatest man of which Illinois can boast was the product of the driftless area.

It is particularly appropriate and significant that an ox yoke hewn by young Abe Lincoln occupies the place of honor in the ornate library of the University of Illinois. It is especially the aim of a State university to reach and help such boys as he, and I am not so pessimistic about our educational methods as to think that a college course would have hurt him. But to discover the exceptional man and fit him for his peculiar sphere, to pick out a farmer boy and make a lawyer and President of him, is only part of the purpose of a State university. That is something that the universities have always done in some degree. But a State university of the type of Illinois has a higher ambition, and has undertaken a more difficult task. It would not only raise the industrious, but would raise the industry. It would make more giants, but it also desires to elevate the race at once. Lincoln had to abandon the ox yoke in order to find a field for his powers, but the modern farmer boy may find it as fascinating to run a motor plow as a political machine.

Many of the State universities, as I have said, were started as classical colleges and were afterward induced to add industrial departments by the Morrill Act funds. In some cases this process was reversed and the agricultural colleges gradually introduced humanistic studies until they developed into well-rounded universities. The University of Illinois is the most conspicuous example of this, but New England is developing State universities by the same process, as is shown by Maine. In this way or some other all of the Eastern States will, in my opinion, ultimately acquire State universities, for their endowed institutions, superior as they are in some respects to the State universities, do not take the place of them, any more than the existence of good private schools can obviate the necessity of public schools.

This development of the Morrill Act colleges was made possible because of one phrase in that remarkable document. It provides for the

leading object shall be, *without excluding other* ~~humanistic and liberal studies~~ *and including* military tactics, to teach such branches of learning as are related to agriculture and the mechanic arts . . . in order to promote the liberal and practical education of the industrial classes in the several pursuits and professions of life."

This Act, signed by Abraham Lincoln in 1862, was first taken advantage of by the State from which he came, and in 1868 the "Illinois Industrial University" opened its doors. The name was a compromise; so was its policy. The new institution suited nobody. "The industrial classes," for whom it was designed, condemned it; the other colleges of the State disliked it; the Legislature neglected it.

In 1885 the word "Industrial" was dropped, partly because the American conception of a "university" had by that time been expanded so that it was not necessarily exclusive of practical studies, more because the term "industrial" had been contracted to mean "penal," owing to the prevailing custom of those days of employing manual training for the reformation instead of the formation of character. In the early eighties the school superintendent of a neighboring county wrote asking if three unruly children of a widowed mother, the oldest thirteen years of age, could be provided for in the Illinois Industrial University. Graduates of the institution, applying for employment, were liable to be asked: "What were you sent up for?"

The University of Illinois can, indeed, hardly be regarded as more than fifteen years old. It was not until about 1893 that the State really began to take pride in it and to give it proper support. Besides receiving about that time larger appropriations from the State and Federal governments, its growth and ambition were stimulated by two events, the Columbian Exposition and the founding of the University of Chicago. The effect of the latter was very much like the influence of Leland Stanford on the University of California. It might have been supposed that Illinois, since it had not hitherto manifested any ardent desire for advanced scholarship and research, would have had its needs sufficiently met by one first-class university. But there is a difference between the

East and the West in this respect. In the East the State authorities seem to say to themselves: "Here is something that is being done very well by private

try. If Mr. Carnegie puts up a library building in one city, some other city will pay for one out of its own pocket. If Mr. Morgan should establish an art gal-

PRESIDENT EDMUND J. JAMES STANDING BESIDE AMBASSADOR JAMES BRYCE AT THE TIME OF HIS INAUGURATION IN 1906

enterprise. There is no need for us to concern ourselves with it." In the West they say: "Here is something that is being done very well by private enterprise. Why can't we do as well?" The Westerner is always willing to match pennies with any multimillionaire in the coun-

lery in Norman, Okla., to hold his London hoard, the next Legislature of Kansas would pass with a whoop a bill for a bigger art gallery on the campus at Lawrence. So it happened that when Mr. Rockefeller founded a university at Chicago, the State university was not

vantages of higher education which are necessary to the greatest efficiency of social service either in public or private station; and

WHEREAS, The State of Illinois has imposed upon this institution, in its agricultural and engineering experiment stations and in its graduate school, the duty of carrying on extensive and important investigations of vital interest to the agriculture, industry and education of the State, and the conduct of these investigations calls for the very highest ability and the most thorough training on the part of those entrusted with their supervision; and

WHEREAS, The great progress of this institution in the last five years has attracted the attention of the whole country and made other institutions desirous of drawing away the members of the faculties in said university; and

WHEREAS, The present schedule of salaries is not sufficient to enable the institution to compete on equal grounds with other State and private universities in the United States; therefore,

Be it Resolved by the Senate, the House concurring, That it is the sense of this General Assembly that the board of trustees of the University of Illinois should adopt such measures as will in their judgment attract to, and retain in, the service of the University and the State the best available ability of this and other countries.

Those who know the natural aversion of the average legislature to paying anybody a high salary will appreciate the importance of this action. A former president of the University of Illinois was once before a committee of the Legislature begging for money and standing a sharp cross-examination from the members. Finally one of them asked: "Don't you think, professor, you are getting a bigger salary than you earn?" The president retorted: "I am getting \$10,000 a year and I am earning it right now."

The objection might be raised—in fact, the objection was raised in the Assembly when the above resolution was pending—that this was a matter which should be left to the trustees, as they had ample authority to pay such salaries as they saw fit. This is true, and it is also true that the graduate school could have been in some way worked in without making it conspicuous by calling for a specific appropriation, as other State universities have done. Most university presidents prefer to have as little legislative interference as possible. They would rather have a lump sum to spend as they please than have to explain things, not because they are doing any-

thing to be ashamed of, but because some of the work that they regard as of the highest importance is not appreciated or approved of by the general public. It is easier for a university to get an appropriation for some popular form of public service and then use as much of it as possible in support of some related form of pure scientific research.

But it is evident that President James has adopted the opposite policy. He seeks rather than avoids legislative attention, and takes the people into his confidence when he does not have to. He is trying to educate the public to the expressed approval of his ideal of a university, instead of being content with a tacit permission to do what he likes. Instead of saying, or implying, to the legislators: "If you will give me this money now I won't need to ask for so much again," he openly announces that present appropriations mean larger ones in the future. The regents of the University of Minnesota did not permit the establishment of a graduate school until they were assured that it would not cost anything. President James explains not

STUDENTS IN THE UNIVERSITY OF ILLINOIS, 1888-1908

merely to the trustees, but to the Legislature and to the public, by means of a circular, that a graduate school is going to cost a great deal, that it is the most expensive form of education, and that it applies directly to the fewest students,

of the Agricultural Experiment Station. These committees are designated by the law authorizing the investigation. For example, the bill appropriating \$15,000 for experiments on improving farm crops contains the following clause:

GENERAL VIEW OF THE CAMPUS FROM THE TOP OF UNIVERSITY HALL
Chemical Building. Agricultural Building. Observatory. Farm Buildings.

but that it is an essential part of a true university.

This is certainly a more frank and democratic policy. It will be interesting to watch whether in the long run it proves the more profitable to the University. Of course it brings the University into the field of political controversy and arouses a storm of incompetent comment that would drive an Eastern college president to retirement in disgust. One irate Chicagoian went so far as to say that it would be better for the State if the University were burned to the ground. But, on the whole, the University has gained in prestige thru this greater publicity.

Another manifestation of the same policy of seeking coöperation outside the University is the system of advisory committees. These are appointed by the various agricultural societies of the State to assist in directing the investigations

Provided, That the work outlined in this section shall be carried out on lines to be agreed upon by the directors of the Agricultural Experiment Station and an advisory committee of five, to be appointed as follows: Two by the Illinois Corn Growers' Association, one by the Illinois Seed Corn Breeders' Association, and one by the Illinois Grain Dealers' Association and one by the Farmers' Grain Dealers' Association.

Other organizations coöperating with the University in a similar way are the Live Stock Breeders' Association, the Farmers' Institute, the State Horticultural Society, the State Dairymen's Association, the Sugar Beet Growers' Association, and the State Florists' Association. Here, then, are the thirty-five prominent men of the State, not merely interested in the investigations of the station, but sharing the responsibility for them. That is, some of the organizations that not many years ago were passing resolutions denouncing the University are now coöperating with it. Be-

sides the obvious advantage of securing a greater appreciation and support for the research work of the University, the plan is of material benefit to the work itself. The criticisms and practical suggestions of the advisors, some of whom have been trained in scientific agriculture, tend to direct the investigations toward the problems of the greatest importance and to prevent them from becoming "academic." A piece of research in pure science may be legitimate if it has no possible practical application, but an investigation that purports to be prac-

crease its oil content by one-third, which would add \$2,500,000 to the value of the corn crop of the State for manufacturing purposes. The increase of the protein in corn by one-fifth, which has also been effected, would make Illinois corn worth \$6,000,000 more a year for feeding purposes.

But all States have agricultural experiment stations of some sort. More interest, therefore, attaches to the Engineering Experiment Station, which is a peculiar feature of the University of Illinois. I called attention in a previous

A 5,000-POUND CASTING MADE BY THE STUDENTS IN THE LABORATORY

tical and is not. has no reason for existence. Too many of the bulletins of the various experiment stations are of this sort, having neither scientific nor practical value.

The Illinois Experiment Station is able to make its appeal to the people on the basis of definite and profitable results which all understand. By selection of seed corn according to chemical composition it has been found possible to in-

crease its oil content by one-third, which would add \$2,500,000 to the value of the corn crop of the State for manufacturing purposes. The increase of the protein in corn by one-fifth, which has also been effected, would make Illinois corn worth \$6,000,000 more a year for feeding purposes. But all States have agricultural experiment stations of some sort. More interest, therefore, attaches to the Engineering Experiment Station, which is a peculiar feature of the University of Illinois. I called attention in a previous

was that there was a demand for college-trained men in the engineering profession, but not in agriculture. Now, however, there is in engineering a tendency toward expansion, both outward and upward, toward popular education and research. Wisconsin has led in the former, Illinois in the latter.

Neither of these innovations has met with general approval and acceptance in other States. More than once I have been frankly told by the head of a college of engineering that he did not believe in either shop courses or research. But I fail to see why such work is not as legitimate and desirable as it is in agriculture, especially in Illinois, where the products of the manufactories are worth three times as much as the products of the farms. From 1860 to 1906 Illinois rose from the rank of the fifteenth State to that of the third in the value of its manufactures.

Why should it be thought less proper for the experts of the State to inform the people that one kind of coal gives twice as much heat per ton as another than to state that one breed of cattle gives twice as much butter per cow than another? If the university may test fertilizers why may it not test car brakes?

To some people there seems a vital difference between the two cases, probably due to a feeling that agricultural research is in aid of an industry highly individualized and poorly capitalized, while the syndicated manufacturers are abundantly able to pay for any investigations they need in their business. The effect of applied science, however, is to obliterate this distinction. The dairy business, for example, as it becomes scientific, tends to come under coöperative or corporate management, and, on the other hand, the publication of tests of materials and processes tends to break a monopoly based on private knowledge.

The Engineering Experiment Station has ten research fellowships paying \$500 a year. It has issued thirty-five bulletins since its foundation five years ago, covering a wide range of practical problems. The most timely and useful of these investigations is perhaps the testing of reinforced concrete. Here is a new material combining the solidity of stone with the strength of steel, revo-

lutionizing our ideas of building and giving rise—or at least it should give rise—to a new order of architecture. But concrete is of uncertain temper. "When it's good it's very, very good, and when it's bad it's horrid." The difficulty is that the bad looks just as safe and solid as the good. We must learn how much it will stand before we can trust it. That is why they are smashing down concrete columns a foot square and twenty-five feet high in the laboratory of the University of Illinois. Great beams of it are pulled and twisted and bent and broken. Another instrument of torture takes a beam and pushes down on it and then lets up suddenly, 1,500,000 times a day, keeping up this sort of nagging without any rest nights or Sundays until the beam gets all tired out and loses its nerve and goes to pieces. It seemed more cruel to me somehow than the vivisection of dogs and guinea pigs.

But we do not know enough yet even about such common material as structural steel. A bridge was being constructed across the St. Lawrence River at Quebec, a longer span than had ever been attempted. When it was half done some of the rivets gave way and it fell of its own weight, killing seventy-four of the workmen. Just a mistake in the formula, that's all. Now, after it has happened, the bridge commission has sent to this Laboratory of Applied Mechanics of Illinois to have made a series of a hundred tests on riveted joints of nickel steel plates as a basis for the new plans. A force of 500,000 pounds will be employed in pulling some of the joints apart, and the slipping of the plates will be measured to a ten-thousandth of an inch.

The students at the University of Illinois are not stationary engineers. They have a traveling laboratory, a dynamometer car, and when the B. & O. wants a tonnage test made or the New York Central proposes to electrify its metropolitan terminals, they go and do the work. I was given an opportunity to make a trip on the car myself. The car is owned jointly by the Illinois Central and the University, and looks like an ordinary caboose on the outside. In the interior of the car is the automatic recording apparatus. A big roll of pa-

per passes thru it as thru a newspaper printing press, and on top of it half a dozen pens are tracing lines in red ink and making jogs in them occasionally, whenever there is anything worth mentioning. The time, the distance, the pull on the draw-bar, the horse power and the velocity and direction of the wind are all recorded on the sheet. By looking at it one can tell just what the locomotive engineer is doing, when he opens the throt-

branch range from the technical to the administrative side of the railroad business, from the making of engineers to the making of financiers. Whether the latter includes a course in political economy on the art of getting a franchise thru the Legislature cheaply I did not ascertain.

There is no school of mines in Illinois as there is in California, Wisconsin and Minnesota and as a separate institution in Michigan; but one is to be developed

INTERIOR OF THE LIBRARY BUILDING.

tle, when he puts on the brakes, when he increases the draft, and when he swears at the fireman. This last point I did not get from Professor Goss. One of the boys on the car told me.

They have another dynamometer car, of 200 horse power, fitted up with apparatus for electrical as well as traction measurements, and used in testing the efficiency of trolley-road operations. Railroading is, in fact, a specialty of the University of Illinois, as is natural in the State holding the first rank in aggregate mileage. The five courses given in this

soon, and this year a Mine Explosion and Rescue Station has been established at the University by the National and State Geological Surveys, in connection with which training in the use of safety devices and methods of rescue will be given.

The State Natural History Survey was one of the oldest of the auxiliary scientific bureaus, beginning its work thirty-three years ago and being annexed to the University in 1885. A volume with forty-one color plates on the fishes of Illinois based on the examination of 200,-

A PANORAMIC VIEW OF THE CAMPUS

ooo specimens has just been completed. The State entomologist has also his headquarters in the University and contributes to its collections.

One of the biggest and busiest buildings on the campus is that devoted to chemistry. Here, since Professor W. A. Noyes came from the Bureau of Standards, is edited the *Journal* and the *Chemical Abstracts* of the American Chemical Society, and research work in the pure and applied science is active. Last January sixty-three distinct pieces of investigation were in progress in this department. Here the State Geological Survey and the State Water Survey carry on their routine and research work, and here is the headquarters of extensive nutrition experiments on man and beast. Professor Grindley has a "poison squad" much more perseverant than Dr. Wiley's at Washington and likely to get more reliable results. For a year they have been eating meat containing or not containing saltpeter to discover whether this time-honored chemical preservative is injurious.

As is appropriate in a State having a large German population, special attention is given to the Germanic languages. The only periodical of research, except the bulletins mentioned published by the University, is the *Journal of English and Germanic Philology*, now in its eighth volume. This department has just been enriched by the acquisition of the library of the late Professor Heyne of Göttingen, 5,200 volumes on German literature and philology. Here may also be mentioned the active part taken by University professors in the collection and publication of documents relating to the French period in the history of Illinois.

The library has been a weak point in the University of Illinois, as it has only

a little over 100,000 volumes, fewer than any other of the fourteen great universities. But Dean Kinley, the head of the new graduate school, is making a special effort to bring it up to the new requirements. About \$50,000 was spent last year in the purchase of books, more, I think, than any other university has appropriated for this purpose.

I have given an unusual amount of space to the graduate work of the University of Illinois because this is just now its most interesting line of development, altho by this disproportionate attention I have done an injustice to the other universities where research is an old story. It must be understood, therefore, that Illinois is still, as it has always been, essentially an undergraduate institution. When these fourteen universities are arranged according to the number of doctorates they have conferred, its rank is fourteenth. The Carnegie Foundation, which has come to be the arbiter of destinies, has refused to admit Illinois to its privileges, while accepting Michigan, Wisconsin and Minnesota. President Pritchett mentions two departments as the chief reasons for the refusal; these are the academy and the medical school.

All of the State universities have in their early days been obliged to keep up preparatory or sub-Freshman departments, but they have usually been dropped before the university reached the age of Illinois. It is indeed anomalous that high-school pupils should be working under the same faculty and in the same building as graduate students. But whether the University professors should ruthlessly amputate this vestigial organ in order to improve their own financial prospects is a difficult question. A State university is obliged to keep in

FIELD, UNIVERSITY OF ILLINOIS.

touch with all parts of its territory. Its attitude is very different from that of a private university. One aims to be inclusive and the other to be exclusive. The private university is always saying to itself: "How high can we raise our standards of admission without losing students?" The State university says: "How low can we place our standards of admission without losing prestige?" President Hadley states that the primary object of a university is to maintain high standards of scholarship and that a university which fails in this is not worthy of the name.⁴ A State university does not care so much for the maintenance of standards as for the opportunity of public service, and it is not worthy of the name of State university if it is not willing to risk its reputation to save some young man or woman in a backwoods county from an illiterate life. It is this feeling more than low educational ideals or the desire for numbers that makes the State universities sometimes more easy of entrance than seems proper to Easterners.

As I have suggested, Illinois is very unevenly developed educationally. It has some of the best secondary schools in the country and some very poor ones. Only about two-thirds of the high schools are capable of preparing for the Freshman class of the University.⁵ Ten per cent. of them give no foreign language and 65 per cent. of them none but Latin. The University of Illinois stipu-

lates fifteen units for admission, while the University of Wisconsin requires only fourteen, but there is this difference, that the requirement is rather strictly adhered to in Wisconsin, while in Illinois students may be admitted with thirteen units on condition of making up the deficiency in the academy within a specified time. Less than 10 per cent., however, enter in this way. President James, in outlining his policy on his inauguration in 1905, stated his belief that the Freshman and Sophomore work should not be done at Urbana, but in fifty or more institutions scattered over the State, the same idea as President Jordan has. The University, he said, "must be lopped off at the bottom and expand at the top." He is succeeding in the second part of his program, but has made no progress in the first. Yet this must be done in some way before many years. It has been proposed to convert the academy into a model school for the department of education. This might be done, but the model school needed by that department as its laboratory for practice and experimentation is a very different thing. It needs a well-equipped building, with all grades from the kindergarten up, not a few basement rooms full of backward Freshmen hurrying to catch up with their class.

In regard to the medical instruction the University of Illinois is also in an embarrassing position. Being precluded by its location in a small town from establishing a complete course, it has adopted schools of medicine, pharmacy and dentistry in Chicago. The College of Physicians and Surgeons is no great honor to the University, and the connection is purely nominal. The University gives to the medical school its name, and the medical school gives to the Univer-

⁴"A university has two distinct objects in view. Its primary object is to establish and maintain high standards of scientific investigation, general culture and professional training. Its secondary object is to teach as many students as possible in the different lines with which it concerns itself. The two things cannot well be separated. Unless the matter of standards is held in the foreground, a place does not deserve the name of a university." President's Report, Yale University, 1907.

⁵"A Statistical Study of Illinois High Schools," by F. C. Bonser, University Studies, May, 1902.

sity its roll of students. The graduates and advanced students of the University when they leave Urbana do not usually go there for their medical work. They prefer Rush, which belongs to the University of Chicago, just as the Yale graduates are apt to go to Columbia or Johns Hopkins rather than to the Yale medical. Probably the best thing that can be done under the circumstances is to develop at Urbana strong courses in such medical and premedical work as can be done away from a large city. It is questionable whether a complete medical school of high grade could nowadays be built up in a small place, as was done in Michigan.

The situation of the University of Il-

due to arrive about 1960, and the center of manufactures is coming along in the same direction by slow freight.

Comparatively few people in the East know in what town the University of Illinois is located. Neither do the people who live there. Ask one man on the street and he will tell you "Urbana." Ask the next and he will tell you "Champaign." It depends on which side of an imaginary line he happens to reside. This line runs along one edge of the campus, placing the University technically inside the corporate limits of Urbana, but that does not make any difference in the eyes of the Champaigners. The University is between the towns, as the University of Minnesota is between

THE AUDITORIUM OF THE UNIVERSITY OF ILLINOIS

linois accounts for many of its peculiarities. The stranger is apt to think it an out-of-way place, but when he gets there he learns that it is really in the middle of things. The center of population of the United States is headed that way and

St. Paul and Minneapolis, but the smaller the cities the sharper the rivalry. Urbana is the old county seat. Champaign is a newer "spite town," built by the railroad, the larger and more businesslike of the two. Their commercial centers are

only about two miles apart and they run together, indistinguishably to a stranger, making a community of about 20,000 people, not counting the students. But the question of which name shall appear on the letterheads of the University has been the subject of bitter controversy. It is unfortunate that one of the great universities of America should have its educational policy affected by personalities resulting from local squabbles over postal facilities, patronage, politics, shopping, residence and street-car lines. This parochial atmosphere infects the campus, and slight differences of opinion and mode of life assume an exaggerated importance and become aggravated into antagonisms. It is a common fault of college communities, especially in small towns. They are nearly as bad as frontier army posts in this respect. As soon as the University of Illinois grows up to its size this phase of its life will disappear.

I do not mean to imply that individual liberty of thought and action in the University is improperly restricted by authority or public opinion. The controversy arising out of the Kemp case was at its height at the time of my visit, and I took some pains to hear both sides of it, but it did not seem to me that the question of academic freedom was involved.* Dr. George T. Kemp, professor of physiology, found himself a *persona non grata* to the administration, and resigned in indignation, charging the president with duplicity and unfairness. I did not find any sufficient evidence in support of these charges, and, on the other hand, there were no serious accusations brought against Dr. Kemp. It seemed to be an affair of personalities, rather than principles. The question of whether Dr. Kemp's scholarship was sufficiently appreciated need not concern us here, and the further question of whether President James has exceeded the proper limits of presidential power cannot be decided, because there is no agreement as to where these limits are. It will ultimately be settled, not by discussion, but by its results. Our natural predilections are, of course, for the democratic form

of government, but our convictions are somewhat shaken by the observation that universities appear to have made most progress under presidents who were inclined to be autocratic.[†]

The question of whether a university should be located in a large city or in a small one must also be worked out by experiment. The University of Illinois bears about the same relation to Chicago and the University of Chicago as Stanford does to San Francisco and the University of California and as Princeton does to New York City and Columbia. There is a certain similarity in character between the three resulting from their country environment. But the first impression is different, because Princeton and Stanford are distinguished among American universities by the beauty and harmony of their architectural design, while in the University of Illinois no design is apparent and not much beauty. The buildings with few exceptions, are frankly utilitarian in style, but good in their way, getting the greatest possible room for the least amount of money, better than some of the more pretentious buildings of the University of Minnesota. One good thing about them, they are mostly designed by university men. It makes a very bad impression to find that many of our universities have not sufficient confidence in their own architects to employ them on their own buildings. The experience of the University of Illinois with Eastern architects is not encouraging. The new auditorium is admirably contrived for seeing and emptying, but not for hearing. The hearing is too good. It echoes like the baptistery at Pisa. A solo is spontaneously multiplied into a chorus, and a speaker gets as many replies as if he were addressing a mass meeting in England. I am sure that the professor of physics knows enough about acoustics not to have made such a blunder as this. The woman's building, by McKim, Mead & White, tho generally admired, is, to my mind, not altogether successful. The Georgian style has no especial appropriateness to the Il-

*For fuller particulars of the case see *Science*, October 9, 1908; *The University of Illinois Press Bulletin*, December 16; *THE INDEPENDENT*, December 31, and local papers *ad lib*.

†I may mention here that one of the ablest arguments I have seen against an autocratic regime is the address of Dean Davenport, director of the Illinois Experiment Station, on the occasion of President James's inauguration. *Univ. of Ill. Bull.*, Vol. 3, No. 8, Pt. I.

Illinois prairie, and in its arrangement it is not so well adapted to its purpose as the corresponding buildings of Minnesota, Wisconsin and Michigan.

On the whole, I think, the University of Illinois would do well to work out its own architecture. The variety in the color of the existing buildings gives a striking demonstration of the wealth of Illinois in brick clays of different kinds. Then there is a department of ceramics, one of the few schools of its kind in the United States, offering three distinct four-year courses. This department seems to keep itself rather too much aloof from the rest of the University. It appears to me that it might coöperate with the artists and craftsmen on the one hand and with the structural and concrete engineers on the other in the development of some autochthonous art industries. I was much interested in the attempts at new forms of mural decoration in mosaic, not entirely successful yet from an artistic point of view, but indicating a commendable spirit of enterprise and self-confidence.

Enterprise and self-confidence are characteristic of the Illinois temperament and ought to be manifest even in a university. The Illinois student should be ambitious to do things for himself, not merely be content to read about them or think about them. It seemed to me that there are some indications of this disposition in both faculty and students. In my tour of the universities I found I could sometimes learn more about the spirit of an institution by being passively towed around than by striking out for myself. At Harvard my guide showed me the room in which the Prince of Wales had once slept; at Princeton the greatest treasure seemed to be a collection of Virgils in a locked case; in the University of California I was taken to the Greek theater; in the University of Illinois they pointed with pride to a smokeless chimney. I did not believe it was working until I went below and saw the coal going into the furnace, black, cheap fine stuff it was, such as clouds Chicago, but it came out of the top in a state of innocuous oxidation. The school of engineering at the University of Michigan has a high reputation, but somehow I do not feel the same confi-

dence in it as in that of Illinois, because it had one of the smokiest chimneys I ever saw.

I like the way the students put their heart into their work in the University of Illinois. Their studies are to them not a thing apart from their real life, but a part of it. They take pride in their profession; they put sentiment in it and get amusement out of it. In the engineering laboratory I saw a Brown & Sharpe automatic gear cutter, bearing a brass tablet stating that it was given to the University as a memorial to an engineering student who died soon after graduation, C. L. Adams, of the Class of '96. Now this is better from either the sentimental or the practical point of view than if the thousand dollars had been put into a marble shaft off on the hillside or in a monumental drinking fountain that does not work. There would be nothing about these to remind one of the young man whose career was stopped at its commencement. But this machine is a true memorial; it is something that he himself would have taken pride in; it is in the noisy, busy shop, the scene of his activities; it is used by his schoolmates, and is in a very real sense a perpetuation of his influence and personality.

It is said one does not know a foreign language until he dreams in it. It might likewise be said that nobody really gets hold of a science until he plays with it. That is what the Illinois boys do with their electricity. I presume that the Princeton or Pennsylvania boys could beat them at a comic opera, for they can give one that is almost as good—or as bad—as the real thing. But I am sure that Princeton or Pennsylvania has nothing like the electrical show given annually at the University of Illinois. Three floors of the electrical engineering building are devoted to it, fitted up with booths where all sorts of queer things are to be seen and felt, more things than are dreamed of in any natural philosophy. There are model electric railways in operation, demonstrations of wireless telegraphy and Röntgen rays; an electric incubator (chickens only); a model kitchen, where the happy housewife has nothing to do all day but press buttons; a handy safe-boring outfit, a great time-saver for burglars; and a mysterious

"House of a Thousand Sensations," which would make a fortune on Coney Island. For weeks in advance the students work night and day in wiring the booths and devising new apparatus.

Something of the same professional pride crops out in the student pageants on circus day and other festive occasions, as it does in the Universities of Michigan and Missouri. There is developing a trade symbolism that shows a tendency to take artistic as well as grotesque forms. This is promising, because it reminds one of the spirit of the medieval guilds out of which the art of the Renaissance took its rise. The tourist in an Italian gallery, whose idea of art is something as far removed as possible from "trade," gets a painful shock when he discovers that the statue or picture he is told to admire owes its origin to the woolweavers' union. But our commercial and industrial conditions are becoming increasingly like those of the city republics of the Renaissance, and it would be strange if they did not bring in similar art forms as well as less desirable features of that civilization.

There are other student activities that I should like to describe if I had space, for many of them show an encouraging originality and spontaneity; the peanut banquets of the agricultural students; the maypole dance which is the women's pageant; the Wild West shows; the powwows of the Illini tribe—the stu-

dents are traditionally descendants of these Indians, and occasionally show it by an eruption of barbarism; the Spangentinans and Americans take part; the "Welcome to Spring," a simultaneous outburst of enthusiasm, unpremeditated in origin and incalculable in its manifestations, occurring on the first warm evening; and, last and perhaps most worthy of the attention of other State universities, the interscholastic athletic meet. In this the athletic youth of the high schools of Illinois come together in competition on the State University campus. At the Interscholastic meet of 1908 eighty-four schools were represented and the number of entries was nearly 400. Since each local champion is apt to be accompanied by several of his schoolmates, and all are royally entertained, they have a chance to become acquainted with the University under the most favorable auspices. The students from all parts of the State get to know one another, and the high school teachers who come with the delegations in many cases derive as much benefit from this association with each other and the University men as they do from a session of some formal conference. After the games come the student circus and a ball in the armory. The fraternities take advantage of the opportunity to pick their men and even to pledge them several years in advance of their matriculation. The rush line is being lowered year by year,

THE REGIMENT OF UNIVERSITY CADETS ON THE CAMPUS AT URBANA

so we may expect before long that every fraternity will have its cradle roll like some of the fashionable schools of the East.

There are no dormitories for either sex at the University of Illinois, and the fraternity houses are the principal social centers. There are thirteen fraternity and five sorority houses, and about a fifth of the student body is comprised in these organizations. The strength of the fraternities is remarkable when we consider that they were prohibited by law from 1881 to 1891. The Cosmopolitan Club of the University of Illinois is the first of the associations of foreign students to own a home, a \$10,000 building, housing twenty-five students and providing club rooms and a polyglot library. The largest foreign contingent at the University is the Filipinos, of whom there are twenty, more than in any other of the universities. I am reminded of the interest taken in Spanish-speaking students by seeing on my desk a pamphlet entitled *Escuela de Ingenieros y Administradores de Ferrocarriles de la Universidad de Illinois*. There is no general clubhouse for students, but they hope to have one soon. In the meantime the handsome new Y. M. C. A. building serves the purpose very well. This organization is the largest of its kind in the college world, having 900 young men enrolled in its Bible-study classes.

One influence on student character which should always be borne in mind in comparing a State university receiving the Morrill funds with the Eastern endowed universities, that is the military drills. Four words in the Morrill Act have brought it about that all over the country the educated agriculturists and engineers are the only classes to receive training as soldiers. This is ordinarily required only in the first two years, but those who show special proficiency usually remain in the cadet corps as officers and sometimes enter the militia or regular army afterward. They regard it as a point of honor to respond to any call for volunteers in a national crisis, very much as do the men who have been educated at West Point and then entered civil life. Their university training is not merely setting up exercises and the

manual of arms, but includes a comprehensive course in military science.

There is certainly something very impressive about the transformation scene which takes place at the drill hour, when at the sound of the bugle call the student drops his book and picks up a rifle. They come trooping into the big armory from all directions, one from the Greek alcove, another from the forge, frat and barb, country or city bred, some of them very unsoldierly material, careless in dress and slouchy in bearing. From the interior of the armory come the sounds of scurrying feet on the smooth floor, a rattle of arms, a rapid roll call, and suddenly there pours out from the arched doorway a column of cadets, wheeling by fours into the street, erect, trim and uniformed. Company after company salute the colors, an endless column it seems, for there are 1,200 cadets and 100 officers in this university regiment, with a military band of seventy pieces. And this transformation of a crowd of miscellaneous individuals into one human machine is effected automatically. The students do it themselves. The professors are not there to criticise and mark them. The commandant has, apparently, nothing to do but review the regiment.

As peace-loving laymen we all piously hope that these rifles will never be aimed at anything but a target. Still we must all realize that this training is not entirely useless, altho it may never be used. The psychological effect is doubtless more important than the physical. The man educated in a State university has a unity of loyalty that no other gets. His college spirit, his State pride and his patriotism are inextricably commingled, for they have grown up together. When a Princeton man gives the Princeton yell he is not hurraing for New Jersey. But when an Illinois student yells "Illinois," he means the campus, the State and the country altogether. It is a football game and a Fourth of July rolled into one. His alma mater is his motherland. If he serves his country on the battlefield he marches under the same flag and bears on his cap the same initial as when he was a student.

Coeducational universities give a much more differentiated education to the two

PRODUCTS OF THE DOMESTIC SCIENCE DEPARTMENT.

sexes than do segregated universities. The students of Princeton and Vassar pursue much the same studies in much the same way. The difference between them is chiefly geographical. The young men and women of Illinois, altho on the same campus, get a very different sort of training in some respects, and more adapted to the different spheres which are assigned to them in after life by our civilization. One of the most valuable features of the coeducational system, but one often overlooked, is its flexibility and automatic adjustment to changing conditions of occupation and taste. The differentiation of employment which prevails at any given period seems to that generation normal and eternal, but history shows that the boundary line between the spheres of man and woman is shifting constantly. The authorities of a coeducational institution do not have to act as a boundary commission. They are not obliged to determine, or, more properly speaking, to decide, in advance what it is proper for men or for women to know and to do. This relieves the educators from a great deal of embarrassment, because after they have made a decision they cannot enforce it, for the social forces which ultimately determine these things are without their control. In a society whose industrial conditions are mutating as rapidly as ours the maintenance of an equilibrium in a curriculum is as delicate and as necessary as in an aeroplane.

Let us imagine, for example, that in the next thirty years cooking should become exclusively a masculine occupation, as in its higher branches it is now; also that architectural decoration should at the same time go over to the women.

That would involve, if any educational preparation is to be given for these professions, the establishment of a department of cooking at Princeton and of wall painting at Vassar. The idea of it is so shocking and absurd that such action would not be taken, if at all, for a generation after it began to be needed. But in the University of Illinois it would merely mean that one or two erratic or far-sighted boys would now be going over to the household science laboratory and a few girls would venture into the architectural atelier. Nothing more serious would happen to them than that they would incur the ridicule of their own sex and the contempt of the other. This is quite natural and indeed proper, if not carried so far as to be a serious deterrent. It is the reacting force of the gyroscope which keeps our social system from wobbling. Conservatism, like a gyroscope, strongly resists a sudden and disturbing impulse, but is powerless against a persistent force, however slight. A man or woman who wanders far out of the beaten path is presumably either a genius or a fool, and the chances are, of course, largely in favor of the latter. In the assumed case a woman who stuck to cooking in the next generation would be regarded as unwomanly and men who persisted in painting frescoes as effeminate.

A philosopher from Mars who attempted to assign to the sexes their respective duties with proper regard to their capacities as showed by their achievements would certainly never hit upon the culinary art as a feminine vocation. There have been great women mathematicians, poets, artists and warriors, but never in the history of the world

a great woman cook, I mean in the creative or artistic sense. The authorities of the University of Illinois, in establishing a department of household science, however, do not make any assumption as to woman's culinary capacity, nor, on the other hand, is it fair to accuse them of the design of chaining woman to a cook stove forever, as some advanced women think. They simply recognize the existing fact that most women are occupied with household administration in after life and that this occupation, like any other, needs to be intellectualized by science and idealized by art. The woman's colleges are on the contrary still mostly forcing upon their students a masculine education, one taken over bodily from the men's colleges some time ago, and one which the men themselves are largely abandoning wherever they can. It may, nevertheless, be the best possible form of education for both men and women, but no educator has the right to assume such dictatorial powers. The chief defect in women, to my mind, is they have too often in the course of history been content to dress themselves in the cast-off mental clothing of the men.

The work in the household department of the University of Illinois comprises both research and practical applications. I found in the food laboratory of the woman's building a doctor of philosophy of the University of Chicago, who was working on the pectins, a subject of great physiological and moral importance to our domestic life. She had found out the reason why jelly sometimes does not jell. Now the temper of many housewives and the happiness of many homes has been wrecked on that very thing, all for lack of a little litmus paper. But this ancient difficulty disappears at the first touch of applied science.

Of the practical work of this department I must mention the experimental house. This is a house of the ordinary type which is put into the hands of each successive class to make over. They have to plan its arrangement, sanitation, furnishing, color-scheme, and equipment for housekeeping with regard to expense, convenience, durability and artistic fitness. Part of the house is provided with all the modern conveniences, and the other part for a contrast fitted up in

the old-fashioned style with all the ancient inconveniences. That is, these modern girls are being systematically trained to look down on their grandmothers. But perhaps that is the aim of all true education. There are some practical advantages in knowing both the old and the new ways of housekeeping and the differences between them. For example, if one of these domestic science women marries a husband who objects to her newfangled cooking and demands "pies like mother used to make," she will not weep or talk back. She will simply make him some and see how he likes them.

The domestic science work is, however, a new thing here and not yet so well housed and equipped as in the agricultural school of the University of Minnesota. On the side of art and craftsmanship it is far excelled by the Teachers' College of Columbia University.

In the College of Literature and Arts the women slightly outnumber the men (399 to 364 in 1908), but the proportion of men is increasing. In the College of Science the men strongly predominate (229 to 47) and in engineering and most of the other professional schools, except literary and music, they have practically a monopoly. In the University as a whole the proportion of men to women is about four to one.

Military science required of the young men and domestic science offered to the young women are only two instances among many of the recognition given by coeducational institutions in general to the distinctive needs of the two sexes. It is a curious fact—which ought to be a warning to all of us to avoid *a priori* dogmatism—that the effect of coeducation is not to masculinize the young women, as was at first supposed, but rather the opposite. There is a noticeable tendency to exaggerate what are held to be feminine qualities. Many of the girls overdress. They wear too big hats and too fine clothes to school and affect a dependent and admiring attitude toward the opposite sex. On the other hand, the boys are apt to adopt an exaggerated masculinity, even in extreme cases to take pride in being boisterous and uncouth. I am told by instructors in the women's gymnasiums of State universities that it

is impossible to get the girls there to take an interest in athletics, especially in the organization and competition of their teams, as they do in the women's colleges. This induced polarity of disposition is, in my opinion, a wholesome thing, tho it has its amusing and sometimes even its objectionable aspects. I am not convinced that the girls ought to play basket-ball. I merely wish to call attention to the fact that one reason why they do not play basket-ball with enthusiasm is because the boys they associate with can play it and similar games so much better.

On the other hand, the exclusively masculine colleges often show a tendency toward femininity. Their dormitory rooms and fraternity houses are more luxurious and tasteful than those of the State universities as a rule. Anybody looking at the garments, adornments and furniture displayed by the Harvard Co-op., many of them styles designed exclusively for its trade, might think at first glance that he had wandered into the woman's section of a department store. Then, too, some of the amateur actors show great delight in dressing up in women's clothes in their college theatricals and take feminine parts with surprising aptitude. In coeducational institutions they are not so apt to go in for this sort of masquerading except in a spirit of pure grotesquery.

I do not know any reason why the women should have a monopoly of good

manners, delicate taste, nice things and bright colors, and I do not mean to imply that there is anything objectionable in the touches of femininity that occasionally appear in the monastic colleges, but merely to say that in the presence of a strong feminine element they would not be so likely to appear. Our idea of what mental and moral qualities are characteristically masculine or feminine is, of course, conventional. Part of these characteristics are natural, part acquired and part affected. Since we cannot distinguish between them we must accept the conventional view and at the same time give it freedom to change. I might mention here that the University of Illinois is exceptional in having three women on its Board of Trustees.

This university is hard to define because its growth in students and faculty has been so rapid that it has not yet "found itself." Dr. T. J. Burrill, who has been a professor in the institution from its beginning, gave it the impulse toward becoming a true university in 1893 when he presided over it during an interregnum. Under the succeeding administration of President Draper it made great progress, and now, under President James, it is being transformed into an institution worthy of its position as the head of the educational system of one of the richest and most populous States of the Union.

NEW YORK CITY.

The Strike-Riot in Pennsylvania

BY THE REV. LYMAN EDWYN DAVIS

PASTOR OF GRACE CHURCH, PITTSBURGH, PA.

MCKEES ROCKS is one of the industrial suburbs of Pittsburgh, situated on the Ohio River, and separated from Pittsburgh proper by Chartiers Creek. Schoenville, adjoining McKees Rocks, is the site of the Pressed Steel Car Company, employing under ordinary conditions some five thousand men, about 60 per cent. of whom are foreigners.

For the past six weeks the workmen at

this plant, charging many grievances against their employers, have sustained a strike which, last Sunday night, came to its natural climax in the form of a bloody riot. The veritable battle was fought at O'Donovan's Bridge, and the death list comprises eight men, while others are lying mortally wounded in various hospitals.

In the original controversy, public sentiment was unqualifiedly with the strik-

PLANT OF THE PRESSED STEEL CAR

ers, and hardly a voice has been raised in any quarter in behalf of the car company. But the industrial and humanitarian elements of the question have been so obscured by the emerging violence of the past few days, that a demand for the suppression of the spirit of anarchy has displaced every other sentiment.

And whatever may be the original merits of the strike, whatever the reservations of sympathy with which the verdict may be written, it must be said that the immediate human responsibility for the riot of Sunday night rests upon the strikers. The deputy sheriff who was the first official killed cannot be held entirely blameless. He was a blustering fellow, as remarkable for indiscretion as for valor. But his only offense at the time of his death was his refusal to leave the street car at O'Donovan's Bridge, when all the presumed strike-breakers were forcibly ejected. Indeed, this attack at the bridge was merely a symptom of the general anarchy which prevailed that night in the whole zone of influence affected by the strike, save only in the places where dominating groups of officers or soldiers happened to be located.

Who is responsible? The matter of authority in such emergencies is too much distributed for immediate efficiency. Schoenville is located in Stowe Township, but the influence of the strike extends over into the borough of McKees Rocks, with many lines of sympathetic influence extending into the city of Pittsburgh; and all these are in Allegheny County, and in the State of Pennsyl-

vania, and within the jurisdiction, however remotely exercised, of the Federal Government. In certain phases of this emergency, a natural question arises as to which authority of the many shall interpose and assume responsibility. Shall it be the constables of Stowe Township or the policemen of McKees Rocks, or the sheriff of Allegheny County, or the State constabulary, or the Federal authorities? Of course, when the crisis comes all of these will unite for the restoration of order. But at the inception of the trouble, who is responsible?

The violence of last Sunday night was so clearly foreseen and predicted by the general public that it ought to have been foreseen and prevented by those authorities who had finally assumed the responsibility. The sheriff of Allegheny County says that he is in touch with the situation. The authorities have been in touch with the situation when they should have been in command of the situation.

Since last Wednesday evening the conditions at Schoenville were already so aggravated that the authorities should have multiplied at once the forces of law and order. On that evening the street cars crossing O'Donovan's Bridge were stopped and all passengers were subjected to the harshest inquisition, and all those who did not give a satisfactory account of themselves were forcibly ejected, and many of them taken as prisoners to the headquarters of the strikers. Many acts of violence accompanied these inquisitions; and among the injured was

COMPANY AT SCHOENVILLE, PA.

one of the foreign women, who was afterward spirited away and could not be found to give whatever testimony might have been in her knowledge. Such conditions prevailed, with increasing virulence, from Wednesday until Sunday. During all that period, a veritable reign of anarchy extended over Schoenville and the foreign quarters of McKees Rocks. In the daytime the troopers were enabled to control whatever situation might signal them; but at night, and specifically the last two nights preceeding the riot, they remained within the plant of the Pressed Steel Car Company. They were praised in some quarters for this discretion, the ambiguous tribute being based upon the fact that false alarms had often been raised, and that the troopers showed their wisdom in not responding to the supposed allurements of the strikers. It is very natural that the firing of promiscuous shots and volleys thruout the strike zone were calculated to confuse the judgment of officers and troopers.

But the simple fact is, that the troopers remained within the works because their numbers were totally inadequate to command the general situation. They were the prisoners of the situation which they were supposed to command. Another troop has arrived today, and the whole region is under perfect control. Pittsburgh as a city is as self-poised as London. In days of calm, the city marks time, and in days of confusion, the city keeps step, in a manner equal to that of any industrial community in all the

world. In ordinary conditions 250,000 men find manual employment within the precincts of Greater Pittsburgh; and the rebound from the late industrial depression is so great that already 225,000 men have found situations here. Under these circumstances Pittsburgh is naturally very sensitive to the unhappy conditions prevailing at Schoenville, feeling very keenly whatever reflection is thereby made upon the good name of this metropolitan community. And the city can justly disavow all responsibility in the matter; and while the original sympathy of the town was clearly with the strikers, all voices unite in demanding first of all the full restoration of authority in the disturbed district. Accompanying this sentiment there is a growing conviction that the matter of immediate authority and responsibility in such emergencies as this should be clearly defined, and that all secondary authorities should be immediately subservient to whatever is pronounced supreme at the critical moment. From Wednesday night onward, not to speak of any earlier period, street cars were stopped every night with all impunity; boats on the river were fired upon; trains on the Fort Wayne Railroad on the opposite side of the river were picketed; women and children were terrorized, and every possible danger-signal was flaunted in the eyes of the whole community. Everybody knew and everybody declared what the result was bound to be.

What is the natural answer to such a criticism? It is the answer common to

all industrial conflicts in our country. "If we increased the armed force at the works of the company in the controversy, then the people would say that the authorities have in a manner entered into partnership with the company, and thereby also prejudice the original case of the strikers."

In a word, the shadow of the ballot-box falls upon all too many of the official acts of those who are called upon to preserve the order of the community. It is time to eliminate every other consideration but that of the preservation of order, with such a condition of the social fabric in every community as will preju-

years, have undoubtedly been wronged in manifold ways by their employers. These foreigners perhaps are somewhat under the average of intelligence, even for the countries they represent, and this fact has invited the exploitation of those who entertain no principles against such a method. And while the managers and officers of the company may have been themselves innocent of intentional tyranny, tyrants have certainly been abroad among the workmen at Schoenville. It is a universal principle of law that the wrong you do thru the agency of another is done by yourself; and the bosses and other subordinates of the company have

GATHERING OF STRIKERS WITH THEIR FAMILIES AT INDIAN MOUND, WHEELS ROCKS

dice no man's interest and limit no man's equal rights and privileges.

What of the industrial responsibility for this strike? What of the original grievances of the thousands of men employed at Schoenville? It is a big question, replete as all such questions are with a thousand qualifying reservations. But it can only be said that the sentiment of the community, based on settled convictions, and those convictions growing out of the long record of the Pressed Steel Car Company, are entirely with the men. Of the 7,000 employees, about 60 per cent. are foreigners; and these foreigners, on the cumulative testimony of many

years, have undoubtedly been wronged in manifold ways by their employers. These foreigners perhaps are somewhat under the average of intelligence, even for the countries they represent, and this fact has invited the exploitation of those who entertain no principles against such a method. And while the managers and officers of the company may have been themselves innocent of intentional tyranny, tyrants have certainly been abroad among the workmen at Schoenville. It is a universal principle of law that the wrong you do thru the agency of another is done by yourself; and the bosses and other subordinates of the company have

I saw the strikers from Schoenville marching, three thousand strong, thru the streets of Pittsburgh, following to his grave one of their fallen comrades. On board the "President Lincoln," crossing the Atlantic this summer, I saw an equal number of foreigners filing past the

medical line at the New York Quarantine Station. The same impression was made upon me as vividly in the one instance as in the other. It was the impression that a vast ignorant but innocent throng was coming into the possession of what they esteemed to be their own. I saw viciousness in not a single face, either of the throng in Pittsburgh or of the strong multitude on shipboard. But this I saw; the despair of the Old World in every single face lighted up by the awakening hope of the New World.

What then is the psychological situation at Schoenville? It is simply despair creeping in again, where hope had come to shine. These men may be very ignorant; they may be heartlessly exploit-

ed; they may be the victims of conspiracy in a squire's court, in order to filch money from them by a pretended compromise. They may be treated often as brutes rather than men. But, they know very clearly the supreme object of their immigration to America. They have come not alone for liberty, but especially for liberty to seek prosperity. And, if this prosperity is not phenomenal, they immediately conclude that somebody is cheating them. Whether they are justified in their complaint in this instance or not, all the frenzy of their native temperament is added to their disappointed hopes in the prosecution of this eventful controversy with the Pressed Steel Car Company at Schoenville. Who is responsible?

PITTSBURGH, PA.

The Task of the Forest Service

BY OVERTON W. PRICE

[The reputed acquisition of so large a percentage of the water power of the country by a few strong combinations gives timeliness to the present article by the Associate Forester of the United States.—EDITOR.]

A LITTLE more than ten years ago Gifford Pinchot took charge of the Government forest work. Up to then, the duties of the Division of Forestry lay mainly in compiling forest data and statistics, its usefulness was necessarily narrow, and its discontinuance in contemplation. The work employed ten persons, of whom two were professional foresters.

The Forest Service now administers the National Forests, whose aggregate area is about the same as Texas and Ohio combined, and whose money value is more than twice that of the total equipment of the Army and Navy. It furnishes the chief source of information and assistance to private forest owners and users, who wish to practise forestry. Its force numbers about 3,000, of whom 250 are professional foresters.

This great machine is administered under a policy which has the approval and the coöperation of the American people. It is not an impractical policy constructed by theorists—by those who

sometimes hit the bystander instead of the bullseye, because they have not learned the use of the gun with which they shoot. Nor is it a foreign policy, expected to meet conditions under which it was not constructed. The policy of the Forest Service makes no fetish of the forest. It urges no destructive upheaval in economic conditions. But when the line is plain between the use of the National Forests or any of their resources, for the permanent benefit of many, or for the temporary benefit of a few, the Forest Service encourages use by the many and prevents its monopoly by the few.

There are two planks in the platform of the Forest Service. They are these:

To ensure thru public ownership and administration the fullest permanent use of those forests which are essential to the public welfare.

To teach American citizens how to make the best use of forests in private hands and of their product, by finding out and telling them how.

The 104,500,000 acres of National

Forests stand for the first plank. They conserve most of the water and one-third of the timber of the West. This national heritage, whose measurable material resources are worth more than two billions of dollars, is being administered by the

personal courage, fiber, and devotion. The Forest Rangers are the backbone of the service. Were it not for them, the National Forests would soon be forests no longer. And as each of these public servants comes to lay down his tools for

THE FOREST AND ITS SOIL CONSUMED BY FIRE.

There are many million acres like this in the United States alone. All the privately owned forests in the United States could be protected from fire at a yearly cost of one Dreadnought.

Forest Service in the best permanent interest of all the people. At an average cost for protection of about one-fifth of a cent per acre, the damage by fire on National Forests for the last three years has been, per million acres, about 3 per cent. of that on private forest lands. In these three years, the use of the National Forests by the people has more than doubled. In 1908, so great were the demands of the people's business, that an average of only about one-fifth of the time of the Forest Rangers could be given to fire patrol. This was the equivalent of all the time of one man for the patrol of 580,000 acres, an area half the size of the State of Delaware.

From Arizona to the Canadian border, and from California to Minnesota and Arkansas, the Forest Rangers have done their duty. This has meant unrelenting effort, usually under frontier conditions. There is no more exacting work than fire patrol; and short of war, nothing makes greater claims than fire fighting upon

younger hands to pick up, he will leave behind him, in the vigorous, unscarred forests of his district, a valuable heritage to the community and the honorable record of a trust fulfilled.

The protection of the National Forests from fire is incidental only to the development of their fullest permanent use. This use is limited only so far as is needed to insure the permanence of the forest and to keep it in satisfactory condition. Last year 1,500,000 cattle and horses and 7,500,000 sheep and goats grazed within National Forests, or 12 and 21 per cent. respectively of the range stock of the West. Nearly 400,000,000 feet of mature timber was sold and cut, or enough to build 25,000 ordinary frame houses. More than 130,000,000 feet more was given away to settlers for firewood and other home uses. All this timber was cut and logged conservatively, to the improvement of the condition of the forest. Under such management a forest produces wood forever.

For a man can handle his forest in three different ways, just as he can handle money in three different ways, and the same is true of a nation. He can destroy his forest by wasteful logging and the fire which follows it, just as he can squander money until it is all gone. He can protect his forest adequately from fire or other injury, but fail to harvest its crop, just as he can lock up money in a safe and let it lie there protected from loss, but unproductive and useless. Or he can handle his forest rightly and profit by the interest without impairing the capital, like the man who invests money safely and well.

There is nothing intricate about the

have shed seed enough to start young trees to make another forest. Remember always that the sapling will make a valuable tree some day if it is not injured, just as a boy will make a wage earner if he has his chance. Keep fire out of the forest because it is worse than the axe in careless hands, for the fire consumes everything, young trees and old, and the forest soil as well. Waste nothing. These are the principles under which logging is done in the National Forests. The result is to make of them a factory as well as a storehouse of wood.

But the usefulness of the National Forests does not end with producing timber and grass. Their still larger value to

HOW THE FOREST COMES BACK ON THE OLD BURNS

Within National Forests and now protected from fire.

principles or the practice of forestry. It has its own careful, skilled methods based on study comparatively recent in this country, but which in other countries began hundreds of years ago. To describe these methods would fill many pages, and it takes trained men to apply them. But in the last analysis, forestry is common sense, scientifically applied. Cut the mature trees, but do not cut them until they

the nation is in conserving stream-flow. These mountain forests are to the streams of the West what the storage battery is to the wire—the source of energy in reserve. Without forests to check the run-offs, streams fluctuate or even go dry for part of the year; but those streams which rise in well forested watersheds maintain a comparatively even flow.

The Reclamation Service, when its task is finished, will have turned 50,000,000 acres of desert into fertile farm land, dotted with homes. Under its director, Frederick Haynes Newell, whose achievement is national and enduring, this work, unparalleled in scope, is going successfully forward. The story of what has been done by the men of the Reclamation Service, in the face of engineering difficulties historic in their magnitude, has yet to be adequately written. But for the permanent success of its work, the Reclamation Service must depend not merely upon its reservoirs and dams, but upon the thoroness with which the Forest Service does its duty. The preservation of the National Forests is vital to the fulfillment of the national irrigation policy.

In the conservation of water used for the development of power thru electricity, as well as for irrigation, lies another great function of the National Forests, whose importance is only beginning to be generally realized. In the regulation of the development of this power within Na-

tional Forests, thru the leasing of power sites without passage of title to the user, thru a charge for the occupancy and use of these sites, and thru rigid provisions against combination and monopoly, the Forest Service is effectively safeguarding, within National Forests, the interests of the American people, whose property these water powers are. Herein lies the greatest public service which the Forest Service is rendering. The standing timber in the National Forests, which is alone sufficient if it were cut clean to meet all the needs of the nation for ten years, is of less value than the sites for the development of water power, whose usefulness these forests conserve. The complete destruction of this timber by fire would be far less grave than for the power sites within National Forests to pass into unregulated corporate ownership or control.

The power of the immediate future is water power. The trust of the immediate future is the power trust, if nation, State or citizen fail to do their utmost. In

A FOREST WARDEN PUTTING OUT A GROUND FIRE WITH A WET SADDLE BLANKET
 (REPRODUCED FROM THE 1918 YEAR BOOK OF THE NATIONAL FORESTS)

some regions this trust is already firmly entrenched. In others, it is in the making. In every region it is spreading, strengthening, acquiring, where men need power to work for them and water runs down hill. To say there are no combinations to control water powers is to be of them, or to be misinformed.

The following are passages from the

total now in use. Further evidence of a very strong nature as to additional intercorporate relations, furnished by the bureau, leads me to the conclusion that this total should be increased to 24 per cent.; and still other evidence, though less conclusive, nevertheless affords reasonable ground for enlarging this estimate by 9 per cent. additional. In other words, it is probable that these thirteen concerns directly or indirectly control developed water power and advantageous power sites

A FOREST RANGER MOVING CAMP

Over a trail built by the Forest Service. The forest rangers' average district is nearly fifteen miles one way, or about 125,000 acres. The Service has built 12,000 miles of trails in National Forests.

special message of President Roosevelt of January 15, 1909, to the House of Representatives, transmitting a vetoed bill to construct a dam across James River, in Stone County, Mo.:

"The total water power now in use by power plants in the United States is estimated by the Bureau of the Census and the Geological Survey as 5,300,000 horse power. Information collected by the Bureau of Corporations shows that thirteen large concerns, of which the General Electric Company and the Westinghouse Electric and Manufacturing Company are most important, now hold water-power installations and advantageous power sites aggregating about 1,046,000 horse power, where the control by these concerns is practically admitted. This is a quantity equal to over 19 per cent. of the

equal to more than 33 per cent. of the total water power now in use. This astonishing consolidation has taken place practically within the last five years. The movement is still in its infancy, and unless it is controlled the history of the oil industry will be repeated in the hydro-electric power industry, with results far more oppressive and disastrous for the people. It is true that the great bulk of our potential water power is as yet undeveloped, but the sites which are now controlled by combinations are those which offer the greatest advantages and therefore hold a strategic position. This is certain to be strengthened by the increasing demand for power and the extension of long-distance electrical transmission.

"It is, in my opinion, relatively unimportant for us to know whether or not the promoters of this particular project are affiliated with

any of these great corporations. If we make an unconditional grant to this grantee, our control over it ceases. He, or any purchaser from him, will be free to sell his rights to any one of them at pleasure. The time to attach conditions and prevent monopoly is when a grant is made.

"The great corporations are acting with foresight, singleness of purpose, and vigor to control the water powers of the country. They pay no attention to State boundaries and are not interested in the constitutional law affecting navigable streams except as it affords what has been aptly called a 'twilight zone,' where they may find a convenient refuge from any regulation whatever by the public, whether thru the National or the State governments. It is significant that they are opposing the control of water power on the Desplaines River by the State of Illinois with equal vigor and with like arguments to those with which they oppose the National Government pursuing the policy I advocate. Their attitude is the same with reference to their projects upon the mountain streams of the West, where the jurisdiction of the Federal Government as the owner of the public lands and national forests is not open to question."

"I repeat the words with which I concluded my message vetoing the Rainy River bill:

"In place of the present haphazard policy of permanently alienating valuable public prop-

erty we should substitute a definite policy along the following lines:

"First There should be a limited or carefully guarded grant in the nature of an option or opportunity afforded within reasonable time for development of plans and for execution of the project.

"Second. Such a grant or concession should be accompanied in the act making the grant by a provision expressly making it the duty of a designated official to annul the grant if the work is not begun or plans are not carried out in accordance with the authority granted.

"Third. It should also be the duty of some designated official to see to it that in approving the plans the maximum development of the navigation and power is assured, or at least that in making the plans these may not be so developed as ultimately to interfere with the better utilization of the water or complete development of the power.

"Fourth. There should be a license fee or charge which, tho small or nominal at the outset, can in the future be adjusted so as to secure a control in the interest of the public.

"Fifth. Provision should be made for the termination of the grant or privilege at a definite time, leaving to future generations the power or authority to renew or extend the concession in accordance with the conditions which may prevail at that time."

"Further reflection suggests a sixth condition, viz.:

CONSERVATIVE CUTTING IN A NATIONAL FOREST.

After the brush has all hauled out the piled brush will be burned, to lessen fire risk.

TROPHIES OF THE HUNT.

Last year the killing of predatory animals in National Forests by hunters employed by the Forest Service prevented losses which would have exceeded the amount paid in grazing fees.

"The license should be forfeited upon proof that the licensee has joined in any conspiracy or unlawful combination in restraint of trade, as is provided for grants of coal lands in Alaska by the act of May 28, 1908.

"I will sign no bill granting a privilege of this character which does not contain the substance of these conditions."

"I esteem it my duty to use every endeavor to prevent this growing monopoly, the most threatening which has ever appeared, from being fastened upon the people of this nation."

The message transmits a report by the Commissioner of Corporations, Mr. Herbert Knox Smith, who gives specifically, by names, localities and developed horse powers, the chief existing concentrations of water power in the United States. This message, with the above report, is essential to the student of the water power question. And that every American citizen should be, for his own as well as for the public welfare.

In addition to their resources of water, wood and grass, the National Forests serve a host of minor uses of great importance to the settlers who live in and near them, and to the development of the communities in which they lie. A total of about ten thousand permits for these minor uses have been granted, involving the occupancy of National Forest land or the use of other resources, of which

more than a half were without charge.

This vast and increasing business is handled by the officers of the Forest Service, who are the servants of the people, in the interest first of all of the small man. The timber and the grass the National Forests produce cost a fair price to the lumberman and the stockman. For the occupancy and use of the power sites which the National Forests contain, the power companies pay a moderate charge. The settler gets forage free for his milch cattle, wood free for fuel and farm uses, and water without charge to irrigate his farm.

The Forest Service is not charged with the regulation of corporations. But it is charged with the right care of a vast public property. It sees to it that the yield from this property, the water, the wood, and the grass, goes first to those who need it most—to the home builders. For every permit granted to a man to graze 1,000 head of stock or more, the Forest Service has granted ten permits to small owners to graze their little bunches of sheep and cattle. For every large sale of timber, it has made twenty small sales to feed the little sawmills upon which the frontier communities depend.

The National Forests are to the West what coal is to the engine. The Forest

Service is the stoker. There is coal enough in the bunkers to keep a full head of steam thruout the run, if it is not wasted. If it be wasted, the engine will soon slow down for lack of fuel. The nation has only recently employed a trained stoker. Had it not been for the National Forests and their conservative management, much less of the people's property would have been saved.

The inadequate means for enforcing our public land laws, as well as the substance of the laws themselves, have not and do not fully protect the public lands from waste or theft. Men have said that one-third of the Western public domain has passed into wrong hands or to wrong uses, under color of public land laws loosely framed and inadequately applied. But accurate statistics are not needed to make the facts plain. It is our common knowledge and our common disgrace, that the public domain has melted greatly under the heat of individual and corporate greed.

The National Forests contain an important part of what is left. They are mountain forests which grow not only grass and timber, but which feed the streams which generate power and with which the farmer must replace the rain, where rain is lacking. Rightly used, these forests will aid for all time in the building and in the maintenance of homes. Wrongly used, their grass and timber crop would inevitably fail and the streams find in them an enemy instead of a friend. Costly experience has proved that thru public ownership and management only can this national heritage be held in trust.

The second plank in the platform of the Forest Service can be written more briefly—the education of the American people in practical forestry.

Thus to bring about the right use of forests covering one-fourth of this country is a large order. But it is an order which this nation urgently needs filled. The Forest Service has been at work upon it for ten years. These are a few of the questions it is asked, and is answering:

"I have a woodland," says the farmer. "It is in poor shape because I have taken no care of it. What can I do to make it yield more? Wood used to be plentiful and cheap around here and I thought it would be always. But now I need every stick I can raise."

More than a million farmers need that kind of information. This country contains 200,000,000 acres in farmers' woodlots, a much larger area than the German Empire. Most of it is yielding very little. Much of it does not yield enough to pay taxes. All of it can be made to yield profitably firewood or fence posts and wood for other uses on the farm.

This is another kind of question:

"We have a hundred thousand acres of timber land," says the lumber company. "Come and study it and tell us how you think we ought to handle it. In the old days we would have skinned it, and moved on. But times are not what they used to be. Timberland is scarce and it comes high—and we have got so much money tied up in our saw mill and the rest of our plant, that we must have timber to work on, straight along."

The men who need that question answered own four-fifths of the standing timber in the United States. Upon them mainly depend the permanence and the adequacy of our national timber supply. At present, forestry is practised on much less than 1 per cent. of the timber tracts privately owned.

Or another farmer may say:

"I pay a good deal more for fence posts than I used to pay, but they don't last any longer in the ground. Can you tell me how to treat them with some preservative so that they will last longer? I've heard that is worth trying—but I want to know all about it; just how to do it, and how much it costs, and what results I can expect."

Or another company may say:

"We are not in the lumber business. We are in the railroad business. We buy timber to use, we don't produce it. It takes several million ties each year to keep our present tracks repaired, and for the new ones we are constructing. They cost a lot of money to buy and put in the track, and they rot out in a few years. If we could make them last two or three times as long, it would save us some thing. How shall we set about it?"

There are about 700,000,000 ties in railroad tracks in the United States. If all were preservatively treated, it would mean a saving to the railroads of about \$16,000,000 a year. But a still larger saving to the country would come in lessening the drain upon the forests.

These questions cannot all be answered at once, for the trained men of the service cannot read the answers out of books. It takes thoro field work and laboratory work to get them. But once gotten, these answers go not only to the men who asked the questions, but as nearly as

possible to all whom they can benefit. This is accomplished by correspondence, thru Government publications, but mainly thru the daily and periodic press. The newspapers have done more to put useful information collected by the Forest Service before the American people than any other agency. Last year knowledge about the forest and its use collected by the Forest Service was distributed without one cent paid for space in 265,000,000 copies of newspapers and periodicals. To have put this information before the same number of people thru Government publications would have cost more than the total appropriation of the Forest Service for that year. The actual cost to the Government of preparing this material and furnishing it for use by the press, is about ten thousand dollars a year. Beyond the enormous saving in money, the distribution of this material thru the public press instead of thru official documents sets it promptly before the American people, to whom it belongs.

There follow further reasons, taken largely from the report of the National Conservation Commission, which show how urgent is the need for educational work in forestry, based on trained study:

We take from our forests each year, not counting the loss by fire, three and one-half times their yearly growth. For forty years, forest fires have each year destroyed not less than \$50,000,000 worth of timber. Our waste of wood in the forest and the mill is one-third of what we use. And, by careless cutting and fire, the capacity of forests in private hands to produce their like again is being constantly reduced or even totally destroyed. The condition of the world supply of tim-

ber makes us already dependent upon what we produce. From this on, we must grow our own supply or go without.

On the other side are these great facts:

By reasonable thrift we can produce a constant timber supply beyond our present need, and with it conserve the usefulness of our streams for irrigation, water supply, navigation and power. Under right management private forests will yield over four times as much as now. We can reduce waste in the woods as well as in the mill, with present as well as future profit. Preservative treatment will reduce by one-fifth the quantity of timber used in the water or in the ground. Forest fires on private lands can be practically stopped, at a total cost each year of one-fifth the value of the standing timber burned. We shall inevitably suffer for timber to meet our needs until our forests have had time to grow again. But if we act vigorously and at once, and only then, we shall escape permanent timber scarcity.

The task is plain. Under its great leader, the Forest Service has set itself to fulfil it. It has made a good beginning in material achievement. But a still larger national asset which its work has helped greatly to create is a wholesome public sentiment toward the use of the forest. That sentiment will never die, because it is founded on knowledge. The work of the service has laid the foundations of a structure of forest conservation which will endure. They are foresight, self-restraint and thrift for man and nation, in the enjoyment of a natural resource which man and nation hold in trust.

WASHINGTON, D. C.

Literature

Telling the Whole Story

THERE is no longer any question about it. The life-long novel has come again into popularity. This does not mean that the episodic novel which has for a generation been popular will disappear, for the reading public is widening in all directions. It is therefore omnivorous. The detective novel revives—and stays. The historical novel revives—and stays. The mystical romance revives—and stays.

So we have sometimes among the six best sellers half a dozen types of fiction which are not really rivals any more than the sale of potatoes competes with the sale of ice cream. It was apparently William De Morgan who, by that rash venture, "Joseph Vance," disclosed the fact that there was a public which was not satisfied by the narrow field of current fiction, but wanted "to see life clearly and see it whole." This is confirmed by the success of his later books and many others of the same type, most conspicuously "Tono-Bungay." H. G. Wells

has always shown himself sensitive to changes in popular taste while retaining his individuality and views, and his adoption of the new form in place of the short story, the Utopian vision and the scientific romance in which he had made his name, is especially significant. Until the rise of this new movement the general trend in fiction was toward the short-story type, whatever the length, the crisp, dramatic, vivid style, dealing with a few characters in a single situation. The curtain rose and dropped at the tinkle of the bell, and if the stage at times

held more than three or four players they were mere supernumeraries and rarely stepped into the limelight. But the dramatic view of life is not the only one or the truest. Its art is inevitably artificial because real life is infinitely complicated and continuous and no cross-section of it can do it justice. And it is not possible to get a true picture of life or even of a life, by reading a large number of such novels, because the episodes they select

are not fair samples. They are not the ordinary but the extraordinary incidents, usually the single brief period of falling in love, or latterly, a financial or political adventure, the climax of a career ending—or to express it more accurately, cut off—at an instant of triumphant optimism.

Quite the opposite of the episodic story, long and short, is this new form of fiction, or rather revived form, for it harks back to Dickens and Thackeray. It professes to tell the truth, the whole truth and nothing but the truth. This is an impossibility,

since selection, elimination and exaggeration are unavoidable in all forms of art. But it comes nearer to telling the whole story than the other form, and attracts a different, probably a superior class of readers. Some men like chess problems, given a situation to work out the few inevitable moves leading to the mate. Others prefer to play the game for themselves, thru all its shifts and changes, even tho most of its plots come to naught and the moves which promise to bring about a dramatic climax turn out to be tame and futile. The lat-

WILLIAM ALLEN WHITE.
Author of "A Certain Rich Man."

ter class of chess players will like this latter kind of novels.

Two excellent examples of the whole-life novels come to us at once from men five thousand miles apart, Kansas and England; White's *A Certain Rich Man*, and Bennett's *The Old Wives' Tale*.^{*} They are of nearly the same age, a little over forty, and both are journalists who have got their training by writing the episodic short story which originated in journalism. Mr. Bennett is the author of that witty play, satirizing his old profession, "What the Public Wants."

Mr. White was the poet laureate of his class when he was in the University of Kansas. He was doing Riley things then, and doing them very well, too. We have "The Ol' Wood Pump" in our scrap-box yet. But he ruined his career—in the opinion of the professors—by resigning from his class before graduation day and going into journalism, or, rather, the newspaper business, it was called then. Strange to say he has stuck to it ever since in spite of all temptations to come to New York City, where authors average one to a block and earn a precarious living by washing each other's dirty linen in public. In Kansas, however, the average is not more than one author to a township, and less than that in the arid region west of the Hundredth Meridian. But by sticking to his native heath Mr. White has made the *Emporia Gazette* as well known as some New York periodicals we could mention. He has also been able to produce this book, which is a historical novel of the genuine sort because it deals with the characters and scenes that the author knows by living among them. As for the war and "bleeding Kansas" of the earlier days when it was the battleground of pro-slavery and anti-slavery forces, he was born with the understanding and the feeling of them like every other Kansas boy of the time. But curiously enough he fails to see, or at least to impart, the romance and the inspiration of this great conflict. He describes it correctly enough, but mostly its seamy side, the brutality and corruption of the jayhawkers, the sordidness of the motives of enlisting

soldiers. All his enthusiasm and idealization are reserved for the fight of his own generation, the conflict with capitalism. It may be remembered that Upton Sinclair, in a book written with a similar aim tho not to be compared with this in literary art, "The Metropolis," gives a prolog in a Grand Army hall as a starting point.

No such vivid and veritistic picture of Western life has before appeared. The people are like the people we know and the book has the charm of an old album, wherein the stiff and old-fashioned photographs seem alive to us because we knew and loved the originals when we were children. Its accuracy is unimpeachable. Every detail is in its place like a Belasco stage setting. It is also true in the higher sense. It shows by what selfishness, trickery and oppression a great financier may make his fortune and how his own character hardens in the process.

Mr. White has proved by this that he can run a marathon as well as sprint. This novel is not merely a short story long drawn out, or a series of sketches. It has an underlying unity. The chief artistic defect is in his handling of the transitions back and forth in time. His alternations of anticipation and retrospection are jerky and confusing, not delicately modulated like those of Du Maurier, De Morgan and the unknown author of "Margarita's Soul."

One inherent disadvantage of novels of this kind is the painful impression produced by watching the people we have become acquainted with grow old and die. As we get toward the end of the book we feel like saying as many an old person has said, "It seems as if everybody was dying nowadays." The presence of a rising generation does not satisfy us because we do not know them so well. We are willing to see Legree killed off and even Little Eva, but not everybody in the story. This may be a vitiated taste due to reading romances of youth and beauty. But many chronic novel readers will not like the new realism on that account. Before they purchase a book they will look to see if it bears a label on the slip cover similar to that on a box of rat poison, "They don't die in the book."

^{*}A CERTAIN RICH MAN. By William Allen White. New York: The Macmillan Company. \$1.50.
THE OLD WIVES' TALE. By Arnold Bennett. New York: G. H. Doran Co. \$1.50.

This objection—if it be an objection—applies more to *The Old Wives' Tale* than to the book under discussion because Mr. White is inspired with an ethical purpose, while Mr. Bennett has no apparent object except to present a picture of human nature as it is. This he does, pitilessly, vividly and carefully, without caricature but with a mordant satirical touch. It is a solid chunk of reality, a character study in three dimensions. The book was published in England about two years ago under the title of "The Grim Smile of the Five Towns," rather more appropriate than the present title, for it concerns itself almost as much with the fortunes of the rest of the townspeople as with the two women who grow from light-hearted youth to a sad old age in the course of the book. Some of its scenes are disagreeable, but never salacious. The life Mr. Bennett describes is prosaic, even during the Paris Commune, but it is nevertheless intensely interesting because of the author has the uncanny power to turn ordinary people inside out so we can see what they think of themselves. People are always interesting to themselves.

Fictional Aftermath

THE first of the autumn novels are treading on the heels of the straggling rearguard of the summer's generous output; a new season of activity, opening up before us, calls for a final gleaning of the one that is passing. Light entertainment in books it has furnished forth in abundance; the old (and nowadays a novel published three months ago is often old) will probably prove quite worthy to stand by the new that are to succeed them on our shelves, the quality of the bulk of current fiction varies so little from season to season, from year to year. Sufficient it is unto its purpose, which is entertainment for the fleeting hour, without thought of the literary judgment of posterity, tho always with hopes of inclusion in the lists of "best sellers."

In the dozen or so novels here before us, there is a little of everything—of purpose and irresponsibility, of frank invention and painstaking observation of

human nature and the ways with it of human life, of things that have been and are passing, or are, or never will be—a little of all the materials that go to the making of the products of the home art-industry that the writing of fiction has become. The historical novel lifts its head here and there—the "real article" and its many derivatives, tales of what has as yet but imperfectly passed into the historic past; the picaresque tale in its modern disguises, and realism, the realism of the here and now, with, amid much seriousness, a leaven of humor.

Spain—decadent Spain—is to the fore in this fiction, as it is in the day's news, with a novel whose purpose is far greater than its performance, a sermon for Spaniards, in which there is nothing new or startling to the alert civilization behind which the country has been lagging since Philip II died, leaving his unfinished life work of turning back the hands of time doomed to failure. *The Shadow of the Cathedral*: the title is significant enough to be allowed to stand without comment. To the shadow of the cathedral of Toledo, with its legacy of past power and riches and history and art returns the Spaniard who has lived in France and Germany, who has been touched by the modern spirit, who has swung from one extreme to the other, from stagnant conservatism and the Carlist cause to anarchism, a man marked by the police of many countries. Here he observes and preaches and exhorts his author's mouthpiece, but in vain; neither from the top nor from the bottom is reform to be hoped for; Spain sleeps still her age-long sleep in the shadow. A serious book this, with a most serious patriotic purpose, which has caused it to be translated into the principal tongues of civilization, a book notable, also, for its descriptions of the cathedrals, its splendid past, its obscure present, for its frank review of Spanish history as the world sees it. A picture and a sermon, but not a clarion call: the heavy hand of Spanish fatalism rests on these pages. This study of contemporary Spain is a historical novel in the wider sense of the word.

THE SHADOW OF THE CATHEDRAL. By FERNAND
CORTES. Translated from the Spanish by Mrs.
W. J. G. New York: E. P. Dutton & Co.
1900.

Antonio,² by Ernest Oldmeadow, is a striking effort of the imagination, sustained to the end. Its time and place make it historic—the Portugal of the third decade of the last century—but its interest is human, of today and tomorrow, as of yesterday. The author passes lightly over the confusing historic events of that time; it suffices for his purpose to lead his reader thru the quarrels of absolutists and constitutionalists to the suppression of the religious orders and the closing of the monasteries. Antonio, the monk set adrift, has but one aim in life: to buy back the monastery from which he has been driven, and to say mass in its abandoned chapel. He goes out into the world to earn the money he needs for his purpose, he returns and buys the vineyard of his house, saving, scraping, ever approaching nearer to his aim, and then—the English woman enters his life, and tempts him from his allegiance: the struggle between the man and the monk, between love and consecration is on.

More directly historic is S. R. Crockett's *The Men of the Mountain*,³ whose scene is laid on the French-Swiss frontier in the days of 1871, with an excursion into the Paris of the Commune. The book is a pot-boiler, the evident effort it has cost its author to put it together fatiguing the reader.

Contemporary history is found again in *The End of the Road*,⁴ a story of the South Africa that was before the Boer War, of the retreat of the transport rider before the mining engineer, of the invasion of the veldt by the railway—of the lure of the open and the tyranny of the town—and of the coming of the white woman to the frontier which is the province of men, whom she tempts from freedom, and lures back to the bonds they had left behind them. It is the Anglo-Saxon's South Africa already, not the Boer's, who figures but little in these pages. The story the book tells has been lived over and over again on this continent; it now is South Africa's turn, and Australia's: the end of the road of the foretrekkers.

The commuter's wife has sought wider literary fields since she found her first inspiration in her suburban garden. In *Poppea of the Post Office*⁵ she gives us another full-fledged novel, in which there is nothing that is strikingly original—neither plot, characters, nor setting—and nothing that interferes with a placid interest. The early chapters are the best, with their pictures of a New England village in Civil War days; for the rest, there have been many foundlings left on doorsteps in fiction, and their virtues and beauty and sorrows and adventures have filled many books. Poppea is another of a goodly company, quite lovable and beautiful, of course, and, equally of course, the mystery of her parentage does not remain unrevealed.

Pseudo-history without any sense of historic responsibility will be found in Mr. Charles Lowe's *The Prince's Pranks*,⁶ a book that is written without a grain of literary talent, and depends upon its incidents to entertain. These incidents all grow from the supposed unconventionality of the German Emperor, who, in the days of his youth, is supposed to have gone slumming in London during Queen Victoria's golden jubilee, and to have discovered and frustrated an anarchist plot to blow up the royal procession in the course of its progress from Buckingham Palace to Westminster Abbey. There is certainly inventiveness in this; the story has also an easy air of familiarity with the characteristics and ways of exalted personages.

Happy Hawkins,⁷ by Robert Alexander Wason, is a sort of apotheosis of cowboy life, dialect, adventures, chivalry, humor, hardships and all. The racy dialect grows on one, providing he read only a chapter or so at a time, so does the humor very often, and some of the adventures and 'scapes are as gory and narrow as one can possibly desire. Of course, this cowboy, a master among men, has a tender heart, whose queen is a little girl called Barbara, her growth from childhood to womanhood giving unity to a plot that roams all over the West—Wy-

oming, Texas, Nevada, California and Montana. A readable story.

The "old man"—meaning father—is a character that has come to stay for some time in our current fiction. We all know his prototype—the self-made merchant. Here he is again, in *The Making of Bobby Burnit*,⁹ by George Randolph Chester. He dies at the very beginning of the book, but he is its hero nonetheless, guiding Bobby in a series of letters, left by him with shrewd foreknowledge to be delivered to the young men at certain crises in his career. Bobby is placed in full control of the old man's business,

A. T. QUILLER-COUCH.
Author of "True Tilda."

and with a certain amount of money to pay the cost of his early experiences, but the bulk of his fortune is not to be handed over to him until after he has proved his ability to take care of it. Bobby starts in blithely, and proves an "easy thing" for a number of designing gentlemen, quite willing to sell him experience for cash. He ends by running a newspaper, and making a success of an aggressive reform campaign. The appositeness of his father's letters, always ready for him at the proper moment,

their keen prevision and homely practical wisdom, are very amusing.

Here's the Zenda *motiv-cum*—American hero once more, but happily without fighting, and derring-do. A small German municipality—before the founding of the new empire—a young American consul who has served in our Civil War, a princess who has been stolen in her infancy and found again after she has reached young womanhood, a mutual attraction between these two, a marriage arranged for reasons of state, a pocket-Bismarck, a ruling prince in disguise, and *The Goose Girl*,¹⁰ these are the ingredients of Harold MacGrath's story of that name, a German-American veteran being added to their number. The genre is beginning to show signs of wear, the mechanism of its romance is beginning to creak; it is time for the invention of something new.

Mr. A. T. Quiller-Couch is not at his best in *True Tilda*,¹⁰ a sort of picaresque extravaganza of contemporary England, its heroine being a girl acrobat who rescues a boy from an orphan asylum "run" by a reverend ogre, the pursuing villain of the plot. Tilda has a clue to the secret of the orphan boy's birth, learned from a dying woman in a hospital, and together they set out to find the bush on which grew his strawberry mark—which, in this case, is a tattoo mark on his shoulder. Nor should we forget the dog that used to perform with her in the wandering circus which left her behind after she had hurt herself. The dog waited for her until she got better. And so these three wander away on their quest, ever hiding from the parson, meeting many eccentric characters on their way—a couple of strolling players, bargemen, farmers and others—helped by them, and helping them in turn.

A friendly, optimistic realism is the great merit of a volume of sketches, linked together by a slight plot and the unity of their characters, published under the title of *Pa Eliotinger's Folks*.¹¹ Miss Bessie R. Hoover, whose first book this is, has a happy knack of writing dialogue

⁹The Making of Bobby Burnit. By George Randolph Chester. Dime Edition. Mottel Co. 1910. \$1.50.

¹⁰True Tilda. By A. T. Quiller-Couch. Charles Scribner's Sons. 1910. \$1.50.

¹¹Pa Eliotinger's Folks. By Bessie R. Hoover. Dime Edition. Mottel & Bros. 1910. \$1.00.

¹²The Making of Bobby Burnit. By George Randolph Chester. Dime Edition. Mottel Co. 1910. \$1.50.

that, while serving to the full her purpose of exposition of character and circumstance and plot, yet remains perfectly natural. It is a tale of the humble—of a workingman's family, a large family, whose "little mother" is Opal, a child kept busy all day looking after the affairs of her mother's household, and of her married sister's household as well—of the everyday occurrences of narrow lives, of the response to them of different temperaments, of troubles and pleasures, disappointments and hopes, all made worth while by understanding sympathy. These chapters were ideally adapted to serial publication, but one is glad to have them in book form—a modest, slight little book, but worth while.

There is good work in the ten stories by Mr. Charles Belmont Davis, collected from the pages of various periodicals under the title of *The Lodger Overhead and Others*.¹² The note of maturity struck in all of them is, perhaps, occasionally a little *voulu*, the attitude of the man who, having seen much of life, has learned to reflect, perhaps a little deliberate, but the effect is there—a tolerant understanding reaching just far enough below the surface to interest, and to establish a sympathetic relation with, the reader who, too, has lived and seen and reflected, and to impress deeply the young before whom life yet lies, a book opened only at its earliest pages.

Literary Notes

...Volume IV of the Schaff-Herzog *Encyclopedia of Religious Knowledge* (Funk & Wagnalls) appears in due season. It is very full in biography, and embraces men still living. Of the more important titles we note "Egypt," "Esther," "Ezekiel," "Ezra," "Fundamental Doctrines," "Faith," "Gnosticism," "Galilee," "St. Francis," "Eschatology," "Episcopacy," "Easter," "Church of England," "Edwards," and "Eastern Church." Of course it is impossible for so ponderous a work to be quite up with the last fact, which accounts for representing *The New York Review* as still advocating progressive Catholicism, and the discovery of the Jewish temple in Egypt not mentioned under "Ezra." We shall expect it under "Sanballat."

...Those who are interested in the development of Upper Africa should find of value the *Third Report of the Wellcome Research Laboratories* at the Gordon Memorial College

of Khartoum (New York: Toga Publishing Company, \$5.) This Report presents the observations of a local staff of scientific men, and deals with medical, ethnological, agricultural and other scientific subjects. Much space is given to the trypanosome of sleeping sickness and to other parasites of man and the lower animals. Of especial interest, medically as well as ethnologically, is the chapter on the "Medical Practices and Superstitions of the People of Kordofan." The Report is abundantly illustrated and well indexed.

Pebbles

"YOUR boy was just a little—er—wild when he was at college, wasn't he?"

"Oh, yes, he generally was a little wild at first. Couldn't get 'em over the plate, you know. But he always steadied down before the game was over."—*Chicago Tribune*.

AN Irishman caught smallpox, and was sent to the pesthouse. The doctor told him he could not recover, and asked him if the priest should be sent for. "No," the Irishman replied; "send for a Jewish rabbi. I don't want to expose one of my own faith."—*Atchison Globe*.

IN THE DAYS OF THE AEROPLANE.

The movement to spread a safety net over Fifth avenue, to protect persons walking and driving thereon from being hit by lunch baskets and other objects dropped overboard by aeroplanists, has been gathering headway ever since the mayor's silk hat was jammed over his eyes by a squash falling from an unknown height.

The Maine farmers complain that the aeromobilists are now filling the skies in such vast numbers as completely to obscure the sun for five or six hours a day, with the result that the frost is not likely to get out of the ground before September.

The Legislatures of Connecticut, Massachusetts, and North Carolina are expected to pass drastic regulations forbidding and penalizing the atrocious sport, so fashionable among aeromotorists, of trolling for cows. Thirty-two cows were caught by passing air-cars two miles back of Mark Twain's home last Sunday, the tackle being a three-inch cable with an anchor baited with a bale of hay at the end of it.

The relief car has started from the Paris Life Saving Station for the rescue of three aeromotorist whose car burst on Friday night. The occupants immediately took to their parachutes, but, these being out of order, refused to fall, with the result that the travellers have been stranded eight miles up in the air ever since. It is expected that they will be got down in safety.—*Harper's Magazine*.

¹²THE LODGER OVERHEAD, AND OTHERS. By Charles Belmont Davis. Illus. Charles Scribner's Sons. 12mo. \$1.50.

The Independent

Printed at New York Post Office as Second Class Matter
Publisher, CHARLES W. BOWEN
150 EIGHTH STREET - - - NEW YORK

A WEEKLY MAGAZINE. FOUNDED IN 1848.

One Year, \$2.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, \$1.75 a year extra; to Canada, \$1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of *The Independent* are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with \$1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

Our Religious Forces

WE give this week an abstract of the religious statistics of the country as compiled for 1906 by the Census Bureau. Compared with that of 1890, the only previous census of religious bodies, it shows gratifying growth. The religious forces in this country are not weakening, for all the trepidation some express over the spread of luxury and materialism, and the prevalence of criticism and skepticism. We are predominantly a religious people, probably the most actively religious people in the world. Out of a population of something over eighty millions there are 32,936,445 communicants, and a majority of the others are more loosely connected with the churches.

We judge that there has not been the same effort to collect independent statistics for this census as for that of 1890. The officials have gone to the denominational headquarters and sought aid there, accepting the statistics of those churches that carefully compile them, and getting the most trustworthy figures they can find for other churches. While the figures are not so exact as those for population they must come quite near enough

to the truth to be depended on for comparative purposes. The most remarkable increase appears in the Catholic Church, for which 6,241,708 members were reported in 1890, which have now nearly doubled to 12,079,142; but this is much below the twenty millions claimed. The statistics were collected under the direction of Archbishop Glennon, of St. Louis. It must be remembered, however, that they are figured to include all baptized Catholics over eight years old, many of whom have no active relation to their Church. A priest lately published in a Catholic paper the account of his experience in soliciting aid from a company of Italian workmen. They jeered at him and sent him away penniless, while a company of Japanese in the same plant gave him substantial contributions.

This difference in the statistics will only partly explain the surprising majority of Catholic communicants in sixteen States. We expect it in Arizona and New Mexico, which are so largely Spanish, but even New England has apparently been captured by the Catholics, from Rhode Island, where 74 per cent. of the membership is reported as Catholics, to Maine, with 53 per cent. These are States where the native Protestant emigration has been replaced by an immense Irish and Canadian-French immigration. Nevertheless, we do not believe that there is one single State in the Union, unless it be New Mexico, in which the Catholic population predominates, notwithstanding tremendous immigration, and notwithstanding that over the larger part of the country French and Spanish settlements and possessions antedated that of the Protestant English.

The census recognizes the fact that the population of the country is overwhelmingly Christian, and that within Christianity, Protestantism and Catholicism are friendly rival forces seeking to possess the land. The later immigration has been mainly South European and Catholic, composed of those alien to our traditions and history. But while the parents do not much change, the children are in the melting-pot. Even the parents change. We see reports that those who accumulate property here and return to their own land are leaders in all progressive movements. Their children are in

the public schools, and grow up good Americans. Even the efforts to segregate them in parochial schools to keep them from mixing with other children are not of any great damage. They leave these schools after learning their prayers and catechism and go into the public schools; and that makes them good citizens without injuring them as Catholics. Those that get no more schooling after the fourth or fifth grade need not be counted. They will have no influence. The priests and the official Catholic press may try to force the children to remain in the parochial schools, but it is of no use. The parents will not have it so. The Federation of Catholic Societies passes its annual resolution demanding a division of the school funds, but one of the best of the journals, *The Catholic Citizen*, of Milwaukee, edited by a layman, shows the prevailing view of laymen. It says:

"The usual unwise resolution favoring a division of the school fund was indulged in. Perhaps it is better that this piece of folly was not widely advertised. That the endorsement of this proposition has caused no counter agitation as yet is no assurance that later on it may not furnish a weapon of argument and attack to an anti-Catholic movement. When such a movement recurs (as it is bound to) there will be the usual endeavor to blacklist Catholic teachers in the public schools (who must number some twenty thousand) and the usual attempt to elbow Catholics out of all voice in the matter of public education. We shall then hear more of the Catholic Federation and its resolutions. The thing will plague us. We shall have to suffer for the quixotic proclamation of some unwise churchmen. We say quixotic advisedly, for there is as little probability in this country of a division of the school fund as there is of a state church."

And it continues:

"Where zeal is untempered by wisdom, where loyalty is unaccompanied by intelligence, a good cause is sometimes endangered. Certain organizations cultivate an *esprit de corps*, which inculcates not discussion, but discipline, not investigation, but mere allegiance. Then while the organization is effective for action in emergencies, in the long run it proves unsatisfactory.

"It is not educative. It is not abreast with the times. It becomes a mere machine. Let its leadership fall into the hands of reactionaries or self-seekers or adepts in intrigue and its usefulness for all good purposes is past and gone. It is then in some sense the organized ignorance of the party or nationality or church under whose banner it assumes to enroll itself."

Protestants and Catholics are fellow-workers for religious faith. The old hostility has given place to more friendly rivalry. We do not anticipate another anti-Catholic movement unless unwisely provoked, and that is improbable. Protestants and Catholics have the same foe and the same Master. The danger to both comes from the eating ulcer of formalism and materialistic luxury and indifference to spiritual ideals. A passion for truth and a passion for righteousness will keep the Christian Church more and more the controlling force in the country.

Oliver Wendell Holmes

CAN it be that it is a hundred years since the ever youthful Autocrat of the Breakfast Table, the wise physician, the graceful poet, the boyish philosopher of common things, was born, and a decade and a half since he died? He seems one of the perennials that are always with us, he is so human, so full of all sympathy, so brotherly with us all, never the grandfatherly sage of patronizing wisdom.

Dr. Holmes was a favorite correspondent of *THE INDEPENDENT*. Again and again his poems made their appearance in our columns. He was one of that remarkable company of poets, Holmes, Longfellow, Lowell and Whittier, who made American letters known and honored all over the world. That was a wonderful period in English-speaking literary history to which we give the name of Victorian; and America gave her fair share of light to its brilliancy. We are now in the period of a darker aphelion, and not one American poet of present activity ranks with those who were contemporaries of our fathers. Have we lost the sense of sensuous and passionate beauty, and do our men of genius prefer to build bridges and dig canals and subways and operate railroads and corner millions? Is it better? What are the true values of life?

What we value Dr. Holmes for is his wide and lovable humanity. He was a learned man, a teacher of science, a scholar who knew the philosophies of things, but so were hundreds of other moderate men. He was also a man of the most

diverse sensibilities, who could unite pathos with humor in admirable combination, and controlled by perfect taste and kindness. He makes gracious fun of his "Unmarried Aunt," but no one loves her the less; in fact, we knew her ourselves and have loved her in the flesh before we knew her in verse. He was not witty like Hood and Saxe, but humor is infinitely better than verbal wit. Even his most rollicking youthful poems touched the higher vein. And when he left off the comic dance and put on the serious air of affection or patriotism, no American author could equal his "Aye, tear her tattered ensign down," or could like him pour the vitriol of scorn on the "Stay-at-Home Rangers":

"You, with the terrible, warlike mustaches,

Fit for a colonel or chief of a clan,
You with the waist made for sword-belt and
sashes,

Where are your shoulder-straps, sweet little
man?

"Bring him the buttonless garment of woman.

Cover his face lest it freckle or tan;
Must the Apron-String Guards on the Com-
mon,

That is the corps for the sweet little man!"

It was a surprise to the literary public when Dr. Holmes, known to it chiefly as the writer of humorous verse, burst out into the social wisdom of the "Autocrat of the Breakfast Table." Those papers, followed by the "Poet of the Breakfast Table," were the making of the *Atlantic Monthly*. They remain a permanent addition to American literature, equal to the best of the essays of Addison and Charles Lamb. Again we ask, What present-day author can compare with Holmes in those lighter fantasies of wisdom gamboling on the wings of mirth?

It is to the merit of the school of verse and prose to which Holmes belonged that not one of them ever penned a line to degrade character or asperse morals. May it be, can it be, that a lower ethical law, a weaker apprehension of the compulsive negative, accounts in part for a feebler, a more flabby and mushy literary output? And may it be that here also is part of the explanation why genius seeks the materialistic honors and rewards? Millionaires were few in Holmes's day. Now we see them in every directors' board, and, alas! their sons, "*Epicuri de grege porcos.*"

The Benzoate Question

THE Association of State and National Food and Dairy Departments meeting at Denver has completely discredited the Wiley opinion that benzoate of soda is dangerous to use as a preservative. This is shown, not so much by the indorsement of the Board of Referees by a vote of 57 to 42, because that merely registers the opinion of those present, but by the discussion. The argument was practically all one way, the opponents of benzoate rarely attempting to defend the Wiley experiments, but contending that it was inadvisable to permit the use of any preservative; which is another question. Professor Chittenden, of Yale, summed up the conclusions of the referees in the following words:

"From our experiments only one logical conclusion seems possible, viz., that benzoate in small and large doses up to four grams a day is without deleterious effect upon the human system.

"I believe the evidence warrants the opinion that sodium benzoate is no more harmful than corresponding amounts of salt. Certainly huckleberries, cranberries, plums, prunes and other related fruits contain appreciable amounts of benzoate.

"The eating of a small quantity of huckleberries, raspberries or kindred berries is accompanied by the taking into the system of more benzoate than in the administration of three-tenths of a gram of sodium benzoate.

"In the light of our experiments it is difficult to say why benzoate in moderate amounts should be considered any more inimical to health than such a salt as sodium chloride."

Just a year ago we called attention to the fact that Dr. Wiley's sweeping condemnation of all the new preservatives was not justified by his own experiments. Without questioning the carefulness of his work or the accuracy of his published figures we showed that they were susceptible of quite a different interpretation; for example, the loss of weight was the chief evidence of the deleterious effects of the preservative, but, as we proved, the young men of the "poison squad" either gained weight or lost weight less rapidly when the preservative was added to their food than they did before. The reason why the papers of the country took the opposite view was because they considered only the circular issued by the department giving the general conclusions reached by Dr. Wiley, instead of examining the experi-

mental evidence on which these conclusions were supposed to be based. We hope our readers will regard this reference to the editorial of September 3, 1908, as pardonable, since THE INDEPENDENT was the only periodical to bring these facts to the attention of the public, and by taking this unpopular stand brought upon itself much odium.

The essential points of the question can be easily made plain to any one having an elementary knowledge of chemistry. There is a large class of organic substances known as the "aromatic compounds" because they give the flavor to most of our common spices and to many fruits. They can be more easily obtained, however, from fossil than from modern plants, and the cheapest source is coal tar. For that reason they are often called "coal tar products" or "benzene derivatives," since they contain the well known "benzene ring" of six carbon atoms or some similar structure. They have from the earliest ages been the most highly valued of food products, gifts worthy to be offered to kings and gods, and the search for them has been one of the chief motives of geographical discovery, leading to the conquest of India, the circumnavigation of the globe and the discovery of America.

As for their healthfulness, that has always been a debated question. Food purists, ancient and modern, have been inclined to condemn the use of spicy condiments of any kind as well as of salt. This opposition is, however, more because they lead to excessive eating and drinking than because of their inherent harmfulness. Used in excess the aromatic compounds may injure digestion, but their almost universal use for thousands of years in all countries must be regarded as strong evidence that they are not detrimental to health. Tropical races the world over add them to food in what seems to us unduly large amounts without harm and with apparent benefit. At any rate, to eliminate all the "ring compounds" from our food would be practically impossible.

Besides increasing the sapidty of food, the aromatic compounds have another advantage which has enhanced their popularity. They tend to prevent food from decaying by killing off the bacteria of putrefaction. Since the products of putre-

faction are mostly injurious and often violently poisonous (the so-called ptomaines), the aromatic preservatives have been of great service to the human race.

In recent years it has become customary to use some of these benzene or aromatic compounds in an isolated and purified form instead of in a mixture of all sorts of unknown substances, such as the spices with their woody fiber or smoke containing the stronger aromatics, carbolic acid in particular. The two compounds most commonly employed are benzoic and salicylic acids, or rather their salts, the benzoates and salicylates. Both occur in small quantity in common fruits or spices. Both are tasteless and odorless, which is an advantage in that they can be used in preserving fruits and meats without altering their flavor, and a disadvantage in that they may be employed in excessive quantities without the consumer being able to detect them by the taste.

The opposition to them has pursued three lines of argument; first, that they were unnecessary, as food could be preserved by icing, canning or drying without them; second, that they were demonstrably detrimental to health; third, that they enabled the manufacturer to pack refuse and decaying stuff. The first is undoubtedly true. All preservatives, old and new, can be dispensed with; not, however, without considerable inconvenience and expense to both manufacturer and consumer. On the second point, the experiments of Dr. Wiley appeared to show that these preservatives were harmful, but the more extensive and longer continued experiments of Remsen, Chittenden and Long, using doses nearly twice as great, show no deleterious effects in the use of benzoate. The harmlessness of salicylate has not been established by them, but Dr. Wiley's work is inconclusive in this as in the other case. As to the third point, Professor Long proved that rotting tomatoes could be made into palatable catsup by the use of spices, but not by the use of benzoate, for this is tasteless, being classed among the "aromatics" merely because of its composition.

As the matter stands now it appears that benzoate of soda is useful, is not harmful and is not so liable to be used to cover filthy manufacturing as its time-

tempered rivals, the aromatics of the spices and smoke. The matter may therefore be properly left to the public. There are not sufficient grounds for governmental prohibition. Let each person decide for himself. There are risks on both sides, but they are not equal. Nobody has ever been killed and it is doubtful if any one has ever had his digestion impaired by the use of benzoate as a preservative, while cases of sickness and death caused by food that has not been preserved are familiar to all of us.

We hope that Dr. Wiley will not resign on account of this reversal of his opinion by a court of appeals. He is an energetic public servant, and if in this case his zeal has gone beyond his discretion, well, 'tis a good fault and a rare one. There must be room in government departments for differences of opinion on difficult technical points.

The Ice Cap Man

DR. SLOSSON, whose article on "The University of Illinois" opens with an interesting summary of the distribution of various things—human and inhuman—between the glaciated and the non-glaciated areas of the United States, is wisely careful not to commit himself to any explanation of the curious figures that he has brought together. We shall not, on our part, rush in where he fears to tread; but it is always worth while "just to talk over" queer data of this kind, noting the various hypotheses that it suggests. By thus ruminating and criticising, discoveries sometimes are made.

The reader of Montesquieu's "Spirit of the Laws," on first turning over its pages, doubts if our later science has confirmed Montesquieu's ideas concerning the direct influence of soil and climate upon conduct and institutions. A modest acquaintance, however, with up-to-date monographic studies of the interrelation of environment and behavior prepares one to believe that Montesquieu's philosophy had a good deal in it. Investigations, for example, like Dr. Dexter's, of the effect of weather upon conduct, have shown that temperature and humidity have positive, definite and measurable effects in the realm of moral phenomena.

Nevertheless, it seems probable that the influence of even the meridional con-

sequences of physical conditions are more important factors in human affairs than the direct effects of soil and climate are. Land and weather not only harden and bronze us, or soften and sallow us, they also sort us out into kinds, one habitat attracting some of us, while a habitat of conspicuously different qualities gets others of us. This selective function of environment would seem to be worth looking into.

That the glaciated area in the United States should have such striking exhibits to offer, in contrast to the exhibits from the non-glaciated area, is a fact that certainly suggests a rather fundamental and far-reaching selective influence. The economic interpreters of history will not fail to make the most of the unequal land values of the two areas, as a probable cause. No one will think it worth while to deny, we suppose, that land worth \$75 an acre will in the long run draw and retain a more energetic, efficient and differentiated population than land which "stays put" at \$25 an acre. And given the more alert population, most of the other superiorities that Dr. Slosson identifies with the glaciated area seem somewhat a matter of course.

It won't do to forget, however, that a combination of climate (which in part caused, while in part it was caused by, the southern limit of the ice sheet) with the soil qualities produced by glaciation created a condition in this country which in a fateful way supplemented the action of climate on the nerves, and the action of land values in sorting men. It created habits, and institutions correlated with the habits. Dividing the national area roughly into the tobacco, cotton and sugar country on the one hand, and the grain, cattle, mine and water-power country on the other hand, it called for different kinds of activity. Slave labor was profitable in the one area, and not so advantageous in the other. Dependence on slave labor created habits—of thought, of behavior, of political association, which gave as definite a quality to social and to business life within the slave-holding area as the grinding ice cap gave to the soil within the area north of the terminal moraine. That quality once created was as positive a selective force as the price of land was.

Dr. Slosson has opened an entertain-

ing and perhaps an important field for investigation. Perhaps our comments have missed the element, the process, or the product, that further study will lay chief stress upon. We pass the problem on. Possibly there is or was a distinctive variety of *homo sapiens*—the Ice Cap Man. We are skeptical, but lest he arise to confront and confound us, we will not "in the existing state of knowledge" dogmatically deny him as a possibility.

Atoms of Light

It is customary for the president of the British Association for the Advancement of Science to review in his opening address the progress of the last few years in his branch of science. This year the association meets on American soil, at Winnipeg, and the address is of unusual interest and timeliness because it gives an account of the revolutionary changes that are taking place in physics. The president, Prof. J. J. Thomson, of Cambridge, is one of the leaders of this revolution, a brilliant experimentalist and a daring theorizer.

The date and impulse of the beginning of the new movement in physics was the discovery of the Röntgen rays in 1895, which, he says, acted like the discovery of gold in an unexplored country. It opened the way to the exploration of a field of unsuspected wealth of new knowledge and to the radical reconstruction of some of our time-honored and fundamental conceptions. It opened up to us the atom, the *ne plus ultra* of the chemist, and showed within it a system of revolving bodies far more numerous and complicated than the solar system. Already our knowledge of these corpuscles, whose existence was unsuspected a dozen years ago, is greater than our knowledge of the molecules, and we can study them with much more facility because they carry charges of electricity which betray their presence in the minutest number. Three or four of them in a cubic centimeter can be detected while the smallest number of gas molecules which can be discerned with the spectroscope is about ten million million. Consequently Professor Thomson thinks it safe to conclude "that we shall obtain a knowledge of the ultimate structure of electricity before we arrive at a corre-

sponding degree of certainty with regard to the structure of matter."

The tendency of the times is to extend the atomic theory into new fields, to speak of atoms of electricity, of energy, of light, and of ether. The corpuscle, the smallest known particle of negative electricity, is only one seventeen hundredth the mass of the atom of hydrogen. The smallest unit of positive electricity on the other hand seems to be equal to the atom of hydrogen. It is possible, however, this positive particle may be a complex of many positive and negative particles and that the individual positive corpuscle when isolated as the negative one has been may prove to be equally minute.

The discovery of the enormous stores of energy compact in the atom in the form of the electrostatic potential energy of its negative corpuscles gives one a peculiar sensation. It is like finding out that there is a barrel of gold and a dynamite bomb in the cellar of the house. In every atom there must be at least one corpuscle and there may be thousands of them. But counting only one to an atom a gram of hydrogen would be capable of developing more heat than the burning of thirty-five tons of coal. Since energy is wealth we have everywhere enough to make us all rich "beyond the dreams of avarice" forever, but we have no way of unlocking this storehouse, and this is fortunate for us, since "if at any time an appreciable fraction were to get free the earth would explode and become a gaseous nebula." Professor Thomson, in compensation for our natural disappointment at being frightened off these preserves by such a terrifying spring-gun, reminds us that on every sunny acre 7,000 horse-power of radiant energy from our solar dynamo is going to waste and that it is neither impossible nor dangerous to utilize it.

It is interesting to see that our modern physicists show a disposition to adopt a corpuscular or emission theory of light not unlike the conception which Newton steadfastly and vainly defended against the undulatory theory. Professor Thomson reminds us that the crucial experiment between the two theories was the test made by Bennet in 1792 to determine if light exerted any pressure on a body when it struck it as it would if light con-

sisted of minute particles driven straight forward with great velocity. Bennet found no such pressure and the corpuscular theory was regarded as disproved. But it was later found that the undulatory theory also involved such a pressure, and recent experimenters have proved and measured it. As Professor Thomson says:

"It is perhaps fortunate that Bennet had not at his command more delicate apparatus. Had he discovered the pressure of light, it would have shaken confidence in the undulatory theory and checked that magnificent work at the beginning of the last century which so greatly increased our knowledge of optics."

Of course any modern form of the emission theory of light must account, as Newton's did not, for such phenomena as interference and polarization, which are so satisfactorily handled by the undulatory theory. That is, it must combine the best features of both. Professor Thomson shows that only an exceedingly small fraction of the ether is concerned in the forward movement of light, in other words "the wave front must be more analogous to bright specks on a dark ground than to a uniformly illuminated surface." He does not, however, go so far as Planck in regarding it as proved that radiant energy of all kinds has a unit or atomic structure, the color of the light depending on the size of these particles.

The discovery of the pressure of a beam of light has led to some startling conclusions. For example, what shall be done with Newton's law that action and reaction are equal. When a gun is fired the kick of the gun is balanced by the momentum of the projectile. When a reflector throws a beam of light into space, the kick of it is there all right but where is the projectile, if light is merely the undulation of an imponderable fluid? We may suppose that the light strikes some dark body out in space, transmits its impulse to that and Newton's law is satisfied, but it may be a long time before such a body is encountered and it may never be; at any rate a law that remains in a state of innocuous desuetude for several thousand years is not good for much. There are two ways of rationalizing the difficulty. Poincaré inclines toward giving up the law of action and reaction. Thomson prefers to calculate the mass of the ether carrying forward the light.

Newton's law of universal gravitation

is also threatened. Professor Thomson admits that he has a pendulum bob filled with uranium oxide in the Cavendish laboratory to see if a radio-active substance in losing its internal energy loses also in weight. All bodies giving off light and heat are, according to the modern theory, losing constantly in weight. The mass of a body is thus not a constant but dependent on many conditions, its potential energy, its heat, its elective charge, its motion thru space. From Professor Thomson's standpoint "potential energy" is merely a term to cover ignorance, for all energy turns out to be kinetic when we find out what it is, and all matter is electricity. To quote his own words:

"The most natural view to take, as a provisional hypotheosis, is that matter is just a collection of positive and negative units of electricity, and that the forces which hold atoms and molecules together, the properties which differentiate one kind of matter from another, all have their origin in the electrical forces exerted by positive and negative units of electricity, grouped together in different ways in the atoms of the different elements."

✧

Everybody is glad to know
Why Not? that the war is over and no
 body hurt, but immense
 courage displayed. This is the way it
 should be in all wars; not a drop of blood
 spilled, and the result determined by an
 umpire. Why not? Why has not some-
 body suggested this before? It reduces
 war to the equation of baseball or golf.
 Each side goes home happy and boastful
 and swaggering. The General in Chief
 assures us, and he is also the umpire,
 that not either side was defeated; neither
 the Blue nor the Red was whipt, but
 on the contrary both were victorious.
 This really is something new, and it
 brings fighting quite into line with mak-
 ing love; only there is not even a broken
 heart or a suicide. Meanwhile there are
 plenty of distinguished generals, and the
 army looks as nice after the battle as be-
 fore. We do not know whether drums
 and fifes were displaced with mandolins
 and jewsharps, but they might have been.
 The umpire gives great credit to the Gen-
 eral in charge of defense for his really
 "magnificent" tactics—Napoleonic, that
 concentrated his forces at just the right
 moment and saved Boston from being
 sacked. The General replies modestly
 that he only did his duty. The Reds

were "theoretically annihilated," and after "theoretical carnage" both parties started for home in a normal condition, one of them by cars covered with bunting, and the other by the Sound steamers. The whole country pulsates with pride, and sweethearts embrace their heroes. Why not, we repeat, why not? Why shall not navies circumnavigate the globe socially, and armies play at shooting each other? Only it does cost the poor people a big sum of money.

The Authors of the Socialistic Party

We look in *Americana* for history, chiefly, and rich illustrations, but occasionally it drops into prophesy, as in an article in the August number by Milton Baker. The subject is "The Outlook for the Socialist Party in the United States," and from it we learn some things we did not know before. The first page tells us:

"When one remembers that George Allen England, Eugene Wood, Upton Sinclair, Charles Edward Russel, Jack London, Charlotte Perkins Gilman, Ernest Poole and Edwin Markham are actual members of the Socialist party, it becomes evident that editors are 'at the mercy' of these writers, since their number includes the flower of American genius."

In that list of eight names are seven whom we have often welcomed as contributors, but that they "include the flower of American genius" may be questioned by some who give honor to other names. THE INDEPENDENT does not consider itself "at the mercy" of these eight Socialists, and if they were cut off would hope to find acceptable substitutes. We do not find them filling this or other magazines. The writer declares that "Socialism is the real issue of today," compared with which the tariff is "a toy for the amusement of politicians," and he must therefore explain how it is that the Socialist vote of 421,745 of 1908 was very little larger than that of 402,283 of 1904. His explanation is that Socialists voted for Mr. Bryan, "because his program is a step toward Socialism." But we have heard that said of both Roosevelt's program and Taft's. It may be true that "every sun sets on a stronger and more virulent Socialist party," and that "its growth is the greatest phenomenon in history," but the votes last year did not show the growing strength, however it may be, with the virulence.

The Pronunciation of Latin

This is mainly a school question, and yet in the Catholic Church Latin is preserved to a certain extent as a living language which all priests are, or should be, taught to speak. To them the question of the pronunciation is ever recurring. At the time of the Vatican Council the stenographers had no little difficulty from the varying national pronunciations. That of Germany is very different from that of France or England, and these from that of Italy. An effort is now making to persuade all priests to use the Italian pronunciation, but this is stoutly resented. A very scholarly English priest says it is of no practical use to learn to talk Latin for the sake of conversing with Italian ecclesiastics. It is much better to learn Italian, and "they talk it better than they do Latin." He says:

"I have a vivid memory of the sort of stuff they used to talk to us at the Gregoriana (*"Dico quod tu non debes uti hunc librum, quia non est permissum a Patre Professore"*), and it leaves me with the impression that real Italian is on the whole prettier."

That Gregorian Latin nearly equals what Philip II said to the States General of Holland, "*Non curo tuos privilegios.*" The old English pronunciation of Latin against which Milton inveighed so severely is already gone, except on the tongues of old men. The reformed pronunciation had been adopted in England a year ago in 550 out of 557 schools, and a similar prevalence is assured in this country.

Babies and Calves

The American Academy of Medicine has a committee on the prevention of infant mortality. It is startling to be told by them that by our Government "less has been done to give a baby a chance to grow up into healthy maturity than has been done for the average calf," since cattle are recognized as national assets and State and national laws require for them hygienic conditions. Yet it is figured that at birth a baby has a money value of \$90, at five years old of \$950, and at thirty \$4,100. It is estimated that 2,500,000 babies were born in the country last year, of whom 375,000 died, a money loss of \$3,375,000, which is worth saving. The United States Government spent \$4,427,800 last

to protect cattle from disease. In a similar line, at a meeting of the Association of State and National Food and Dairy Departments, Mr. Nathan Straus pressed the importance for the health of the public of seeing that the herds are protected against tuberculous diseases, or the milk is properly pasteurized. He says that according to the records of the Department of Agriculture at Washington, out of 24,784 applications of tuberculin to cattle there were only 397 errors of diagnosis, and he concludes:

"Your association can render no greater service to the public than by holding up the hands of the officers who are adopting the scientifically-justified policy of forbidding the sale of milk unless it comes from tuberculin-tested herds or has been properly pasteurized."

There are some sharp words which we regret to see between the *Epworth Herald*, Methodist, and the *Christian Endeavor World*. The Christian Endeavorers held an enthusiastic convention in St. Paul, and the *Christian Endeavor World* reported addresses and action taken expressing the hope that young Methodists of the Epworth League might some day federate with the Christian Endeavor, as they have done in China, as Epworth Leagues of Christian Endeavor. The *Epworth Herald* scouts the idea, says it is an "improbable and impossible hope," and that in suggesting it the leaders "mislead the young people who follow their banner," as the proposition is "sheer nonsense," that they are "simply meddling," and it concludes:

"And so, the proposal is to be made once more that we of the Epworth League allow ourselves to be smothered under that designation of 'the larger fellowship,' Epworth League of Christian Endeavor. We thought that this curious specimen had been sent to the taxidermist, and had been duly and decently set up in the Museum of Interdenominational Misfits and Castoffs. And so it had. It is unseemly, untimely, and unnecessary to drag it forth again and try to galvanize it once more into life. It is dead. Under the stimulating action of the batteries its enthusiastic sponsors may hope to revive the thing. But they are doomed to disappointment. The specimen is dead. So why not leave it in the museum? It looks better there."

The *Christian Endeavor World's* reply is that "the only charitable interpretation of statements made is that the author

of them is ignorant of the facts." It says that in Canada there is such federation, the Methodists having the Epworth Societies of Christian Endeavor, and that in Australia the Methodist young people are united with all other denominations in Christian Endeavor.* We think we can guess what the chief objection is. It is financial—the valuable publication business is involved.

It has been whispered about that Mr. Rockefeller has in mind to make a very large gift for the benefit of Western education in China, but no trustworthy information has been divulged. We only know that Prof. E. de W. Burton, of the New Testament Department in Chicago University, has been in the East for a year on this business, and that Prof. T. C. Chamberlin, of the same university, the geologist, followed him later. They have now just returned, but they are reticent as to plans proposed. They admit the expectation that the University of Chicago will establish a large branch university in the Far East, and that fellowships and courses by Chicago professors in the East are a part of the plan. We take this from a Japanese paper, and we observe that a New York paper prints the account *verbatim the next day as a "special cable message" from Tokio.*

In Germany they are all mad over Count Zeppelin's success in flying with a dirigible balloon from Lake Constance to Berlin. But they are away behind the times. The future is with no balloon, but with the heavier than air machine, the true airship, and that the French have, with America not behind. In five years the balloon will be in the scrap heap.

It appears from this week's contests that aeroplaning is a safer sport than automobiling. Nobody has been hurt at Rheims, where twenty-five aeroplanes were flying about, but in the automobile races at Indianapolis five people were killed and at Brighton Beach the score is one dead and five wounded. But the race was not interrupted.

INSURANCE

The National Convention of Insurance Commissioners

THE National Convention of Insurance Commissioners held their fortieth annual session at Colorado Springs last week. Insurance officials of thirty-five States responded to roll call, which is indicative of the estimation of the importance of the convention prevailing among the several States. Commissioner Benjamin F. Crouse, of Maryland, the retiring president of the convention, presided. Previous to adjournment the following officers were elected for the ensuing year, viz.: President, J. A. Hartigan, Minnesota; secretary, H. K. Cunningham, Montana. W. F. Hotchkiss, of New York, was elected on the executive committee. Mobile was selected as the meeting place in 1910.

So much has recently been said on the subject of the taxation of insurance companies from the companies' standpoint that it seems but fair to here give place to a notable address delivered at this convention by Commissioner Love, of Texas, who presented his discussion of "The Taxation of Insurance Companies" from the commissioner's standpoint. As will be seen, Commissioner Love does not consider that there is any more reason why life insurance should be excluded from taxation than real estate. He is, however, in favor of a uniform tax on gross premiums. He said in part as follows:

"Real estate of life insurance companies is undoubtedly taxed on the same basis as other property, but the property of life insurance companies other than real estate is not taxed as is other property. All taxes paid by life insurance companies of every kind are far less in amount than the taxes which would be paid by others owning property of equal value.

"It is difficult to contemplate the great life insurance interests of this country, with their thousands of millions of assets, their millions of surplus earnings, their high-salaried officers and managers and their enormous annual expenditures for the purpose of acquiring new patrons, as being in the same financial category as our churches, schools, cemeteries and institutions of public and private charity. It is difficult because it is impossible to do so logically. The life insurance business is a most beneficent business, but there are many others also, and beneficence must not be confounded with benevolence.

"Life insurance companies are great business institutions, not charities, and they are in no

way dependent upon or entitled to receive public or private voluntary contributions for their support; they are engaged in the negotiation of purely business contracts. They give nothing which has not been paid for at a fair price and they receive nothing except for a valuable consideration.

"The man who contributes his money year after year in life insurance premiums does perform a most worthy and commendable act in guarding his family from misery and want after he has passed away, but such an act can certainly be no more worthy or commendable than that of the man who devotes a portion of his earnings to the acquisition of a home for the purpose of guarding his family from misery and want during his life as well as after he has passed away, yet a very large proportion of all the taxes contributed in the American States are paid by reason of the ownership of the homes of the country, and these taxes have the direct effect either to increase the cost or to reduce the comfort and utility of the home; yet there has been no demand for any abrogation of these taxes.

"In order to prevent discrimination between policy-holders residing in different States, as nearly as it is practicable to do this, the rate of tax collected within each State should be the same. The average rate of tax now paid by the life insurance business of the country, while evidently less than that paid by the owners of property generally, whose property is listed for taxation, can be defended upon the ground that it is impossible for the owners of life insurance assets to evade taxation, while in the case of most other owners of personal property such evasion is easy and common.

"If, therefore, a uniform rate of gross premium taxation were agreed upon for all of the States which would yield approximately the same amount of tax now paid by life insurance companies of all kinds, for all State and local purposes, it is believed that the nearest possible approach to equality of taxation would be attained, and that no materially unfair tax burden would be imposed upon life insurance companies or their policy-holders.

"The movement to abolish life insurance taxation or to substantially reduce its present average rate must be a futile one. It cannot and, as I believe, it ought not, to succeed, but it is possible and highly desirable to get a general agreement upon a standard percentage of gross premium receipts which shall be contributed altogether, in all forms of taxes, licenses and fees, in each of the States.

"Such a movement could be supported upon grounds of justice and common sense and would appeal to the people and to their lawmakers. For its promotion appeals to false sentiment and endeavors to excite the tax-dodging cupidity of policy-holders would be unnecessary. It should be inaugurated by the insurance commissioners of the various States, who are part and parcel of their various State governments charged with the necessary, difficult and unpopular task of apportioning the burdens of taxation among the people and who are also the hired representatives of all the people of the State in insurance matters."

Bank Advertising

IN small towns, where there is but a single bank, those who wish to do any local banking business must needs go to this one bank, which, of course, does not need to advertise. In larger towns and in great cities where there is a multiplication of banking facilities, there is, of course, greater need for bank advertising. In an address on "Bank Advertising," delivered before the last annual convention of the California Bankers' Association, F. W. Ellsworth, of the First National Bank of Chicago, presented many interesting and pertinent facts relative to this subject. He said in part as follows:

"It is not so long ago that banks considered it undignified to solicit business in any way. Today the bank which has the same conception of the word, and refuses to exert itself to secure customers, is either standing still or losing ground, with the chances larger in favor of the latter condition.

"Undeniably, this is true, whether all bankers are pleased with the changed conditions or not. Exertion for new business may, indeed, become overexertion, and then the bank pays too dear for its whistle. But legitimate means of adding to a bank's business by advertising or other proper form of bidding for popular favor can be defended upon many grounds.

"Is it better, for example, for reputable savings banks to advertise their facilities for taking care of people's money, returning it when wanted with interest, or to allow the savings of the thrifty to be hidden away in the ground, in the unused stove or in various hiding places, to be lost, stolen or destroyed? Should the banks refrain from advertising while every ge-rich-quick scheme under the sun is trying to entice the people's money away from them? Shall the bucket shop be allowed to put forth its glaring announcements while the bank or bond dealer with safe and sound securities to sell keeps silent?

"Those who do not favor bank advertising must answer these questions affirmatively—but there are precious few such banks in the country.

"The bank, a beneficent institution, in its competition for the public's money, comes into conflict with schemes of all kinds, ranging from the hazardous and visionary to those which are swindles pure and simple. The promoters of these dangerous and dishonest schemes do not spare their use of printers' ink. It is their chief reliance. While the banks cannot, and should not, go to the same lengths in

advertising their business, they can at least place before the people in a clear, intelligible and attractive form the inducement which the bank offers in the way of safety and service. Then, if people lose or waste their money by putting it into foolish and reckless schemes, the banks will at least have offered them the choice.

"The growing popularity of banking, the wonderful development of savings accounts in particular, indicate that the educational advertising which has been done by the banks of late has begun to bear solid fruit."

Mr. Ellsworth's address dealt with a number of phases of bank advertising, and was especially valuable as representing the experiences of one identified with one of the largest and most successful banks of the country.

Most banks advertise their dividend notices and many set forth the fact that interest is allowed on daily balances when such is the case. The Bankers' Trust Company conducted an extensive advertising campaign when it brought out the American Bankers' Association travelers' cheque scheme, of which it was the designated depository, and, as Mr. Ellsworth pointed out, there are many legitimate avenues for bank advertising. A number of banks have found it profitable to exploit banking by mail in paid advertisements in magazines, by means of pamphlets and by advertising otherwise.

....This is an era of bank consolidation. One of the more recent moves in this direction is under consideration by the directors of the Commercial National and the Bankers' National of Chicago. As now proposed, the assets and business of the Bankers' National will be taken over by the Commercial National. The capital of the new bank will be \$7,000,000. Hon. George E. Roberts, sometime Director of the United States Mint and now president of the Commercial National, will be president of the new institution. Edward S. Lacey, ex-Comptroller of the Currency and now president of the Bankers' National, will be chairman of the board of directors of the consolidated bank.

The Independent

VOL. LXVII NEW YORK, THURSDAY, SEPTEMBER 9, 1909 No. 3171

Survey of the World

Secretary Ballinger
and Mr. Pinchot

There has been an immense amount of talk in the papers about the assumed quarrel between Secretary Ballinger and Forester Pinchot, but very little of the supposed difficulty has yet come to light, and no conclusion of the matter. A part of the trouble arose in the reports made to the President by Louis F. Glavis, a special agent of the land service, from which it was gathered that officials in the Interior Department were in league with corporations to hurry patents for very valuable coal lands in Alaska without giving opportunity to hear claims. The President directed Secretary Ballinger and several other high officials in the Department of the Interior to present to him full reports and this has been done. Information has been also given charging that the Interior Department is opening to entry lands which President Roosevelt had withdrawn for the purpose of protecting the rights of the people. Secretary Ballinger hastened on from the Pacific Coast and made investigation in Washington and is this week with the President. The Washington correspondents will have it that Mr. Pinchot is in danger of being removed on account of his efforts to prevent the water powers of the country going into the possession of a few large corporations, and in defiance of President Roosevelt's policy of putting large areas of forests under public control. Two papers on water powers, by W. M. Steuart and M. O. Leighton, give statistics as to the total amount of water power in the United States, developed and undeveloped. More than five and a third million horsepower

has been developed, the average per wheel being about 100 horsepower. There are ten powers of more than 40,000 horsepower, six of more than 60,000, and three of 100,000 or more. Pennsylvania has the greatest number—3,721—and New York is next, with 3,148. A conservative estimate of the undeveloped power is that, if all practicable storage sites were utilized and the water properly applied, there might be established eventually a total installation of at least 200,000,000 horsepower. The region offering the greatest possibilities of water power development is the northern Pacific, which includes the basin of Columbia and Sacramento rivers, the possibilities there being about one-third of those of the whole United States. The President has accepted the resignation of Mr. Ormsby McHarg, Assistant Secretary of the Department of Commerce and Labor. He had made an attack on the policy of another Department of the Government which has charge of the conservation of forests and water supply. He had opposed its fundamental principles when he said that "the abundance of our forests is such that the alarmist statements as to the approaching exhaustion of supply are utterly unfounded." There are still great forests in Washington and in parts of the South, but they are being exploited by lumbermen in increasing numbers. Pennsylvania, once a solid forest from the Delaware to the Ohio line, has been almost denuded of its merchantable timber. The same is true of Ohio and Indiana. The great forests of Michigan, Wisconsin and Minnesota originally contained a stand of about 350,000,000,000 feet of timber. The

president of the Mississippi Valley Lumbermen's Association reported that in 1902 there were 85,000,000,000 feet, or about one-fourth of this still left, and the cutting has continued vigorously ever since. Mr. McHarg accepted his present position for only six months, and will now retire. The President does not like public quarrels between officials.

Cabinet Affairs

Secretary Knox has added to the State Department the office of counselor, and Henry M. Hoyt, formerly Solicitor-General, has been selected for the post. He will deal with all the large legal questions which may arise, and will have especial supervision over the negotiation of treaties. The important Japanese treaty is to be entered into within the next two years, and Mr. Hoyt will devote himself largely to the framing of this measure and to preparing the preliminary foundation for the negotiations. International law will be the field of the counselor, and Secretary Knox feels that a long existing want in the department has been happily filled. There has also been organized the Far Eastern Bureau, which has for its object the fostering of trade with the East, and two men experienced in China and Japan have been called home to be in charge of it.—The reports sent to Postmaster-General Hitchcock indicate that the deficiency in the Post Office Department will amount to \$20,000,000, a much larger amount than ever before. He is investigating the ways to reduce this deficit. He learns that \$3,000,000 of it is in the registry service, where the complexity of the accounts seems responsible for much of the expense. The Postmaster-General thinks it can be simplified considerably without detriment to efficiency and safety. It is even reported that he considered the propriety of abolishing the money-order service, but an increase of the fee was decided on. It may be thought wise not to extend the expensive rural free delivery service at present.—The Post Office Department will issue September 20 50,000,000 two-cent stamps to commemorate the Hudson-Fulton celebration. It will give the Palisades and the Hudson River and the

"Clermont" sailing up the river, with an Indian in the foreground.—The Postmaster-General has awarded a contract for about 3,500,000,000 postal cards more ornate and decidedly superior to those now in use. They will be of better stock, less fuzzy, stronger and yet lighter. It is calculated that they will supply the want for four years.

New York Politics

In the pages of political news at this season considerable interest has been turned to the likelihood of fusion of all the elements to oppose the continued rule of Tammany. One large element is the Independence League, of which Mr. Hearst, proprietor of a series of popular daily papers in various cities, is the leader. At a meeting of the League's county committee last Friday, Mr. Hearst answered many questions, and among them whether he favored fusion, the majority of the committee being apparently opposed to it. He said that the Independence League would enter into no alliance with Tammany, nor with the Republican or any other party, unless it accepted the League's chief contention, that the city must own and control, but not necessarily operate, all future traction routes. Not even if Tammany should put up Judge Gaynor would the League support him without this pledge. It appears to be settled that Tammany will find all the opposition forces united at the coming city election. The executive committees of the Republican party of the city and county have past resolutions committing the party to fusion, and the Committee of One Hundred and other minor bodies are likely to follow suit. This will compel Tammany to put up its best candidates, perhaps Judge Gaynor and Mr. Jerome. But Judge Gaynor has issued a letter accepting an independent nomination without regard to party, and expects Tammany to endorse him, and to have the support of many Republicans. He is regarded as free from all obligations and desirous to serve simply the interests of the city.—Mr. Jerome has announced that he will be a candidate for his present office as District Attorney in this city. He will be nominated by petition, as in 1904, when, tho a candidate of no party, he

won the election against Tammany. It is supposed that Tammany will this time feel obliged to endorse his candidacy, as he is a great vote-getter, and Tammany's rejection of him at the last election was the great blunder of Charles J. Murphy as the leader of Tammany. But neither the Republican party nor the Committee of One Hundred is likely to endorse him.

—The president of the Boro of Brooklyn, Mr. Bird S. Coler, has presented to Governor Hughes charges against Mayor McClellan. He has not asked for Mayor McClellan's removal, for the interval before the expiration of the term of both of them is too short for the investigation. He charges Mayor McClellan with maliciously using his power of investigation of the conduct of Mr. Coler and other Brooklyn officials for his own political purposes, and without regard to fairness and justice.—The directory for Manhattan and the Bronx for 1909 contains 503,769 names, being 41,292 more than the previous year. The erection of four large buildings, such as the Hudson Terminal and the Singer Building, furnished 6,000 names.—The New York State Civil Service Commission has made a new ruling which attracts interest. It is announced that hereafter candidates must attain a general average of at least 60 per cent. in each subject of the written examination before receiving a rating for experience or personal qualifications. Experience will be rated on the statements submitted in the application. Personal qualifications will be rated on an oral examination to be held at a future date at places as convenient as possible for the attendance of those candidates who pass the written test. This is claimed to be a vindication of Governor Black's idea that a candidate should be rated 50 per cent. for "merit" and 50 per cent. for "fitness," his method of "taking the starch out" of the service. He secured such a law, and it was repealed under Governor Roosevelt.

Labor Unionism President Gompers, of the American Federation of Labor, has been attending the International Union Congress, Paris, after completing a thorough study of European conditions. On Labor

Day he reviewed his studies and gave his results, and declared that the American Federation of Labor is the greatest strictly workingmen's movement in the world:

"Unlike the movement here in France, the American Federation is unimpeded by socialists, reformists and revolutionists, who are constantly stirring up internal strife. The American Federation always makes tomorrow a better day for the American workingman than he enjoyed today. Our goal is to give to the laborer the fullest enjoyment of the fruits of his labor. Three-fourths of the workmen in America today are enjoying an eight-hour working day, with Saturday half holidays in June, July and August. The task in America has been a hard one—harder than that of any other federation, for in America we have eight million negroes, 150,000 immigrants annually, and the most powerful capitalistic organization in the world."

Mr. Gompers declared that the labor unions asked no favors from the Government, desiring merely the right to combat for themselves for their inalienable rights. Speaking of the anti-military movement that has been instituted all over Europe by workingmen thruout their labor organizations, Mr. Gompers said he favored world-wide peace, and hoped the day would come when it would be possible. Until that time, however, he is not in favor of national disarmament. Mr. Gompers returns to this country to stand trial on his appeal from the jail sentence imposed on him by a Federal court in the District of Columbia.

Various Items The end of the McKees Rocks strike appears to be at hand. The executive committee of the strikers, thru the McKees Rocks Chamber of Commerce, offered to return to work on terms that amount to practically a surrender. The company received the terms, and sent answer that the matter would be discussed with individuals as they appeared at the information bureau of the plant. The strikers asked that all cars now in the plant unfinished be completed on the old scale of wages. They offered to continue work on contracts which the company made previous to the strike at the old scale of wages. After this is completed they ask that a new scale, based on the 1907 scale of wages, be put in force.

A New Jersey State law requires saloons, as well as other places of busi-

ness, to be closed on Sunday. But in Atlantic City the saloons have remained open. Governor Fort called the attention of the Mayor, Mr. Stoy, to his neglect to see that the law was observed, but he paid no attention to it and the saloons remained open. Then the Mayor was arrested on a charge of neglect of duty, and held in bail of \$5,000 provided by three leading men, two of them presidents of local banks. On news of his arrest the saloon keepers agreed to open again last Sunday and did so. The sentiment of the business men of the city appears to be with Mayor Stoy and to condemn his arrest. The president of the City Business League says that the best people regard the arrest of Mayor Stoy as an insult to the resort, quite unwarranted, and makes him a martyr. But the low gambling dives have been broken up.—First the Cunarder "Mauretania" cut down the time of passage from New York to Liverpool by two hours, and on Thursday last the "Lusitania" made the distance to New York in still shorter time, 4 days, 11 hours and 42 minutes, reaching her dock on the fourth day after starting, cutting the "Mauretania's" record by 2 hours and 56 minutes. She had most favorable weather except for half a gale on Wednesday night. The ship burned 1,100 tons of coal a day, costing \$16,000 for the trip.—The Alabama State Board of Health is much disturbed over the prevalence of the disease called pellagra in several counties, and they have no means of curing it. It prevails in certain countries in the Old World where the people depend much on maize for food, and is supposed to be caused by eating maize affected by mould.

The Discovery of the North Pole

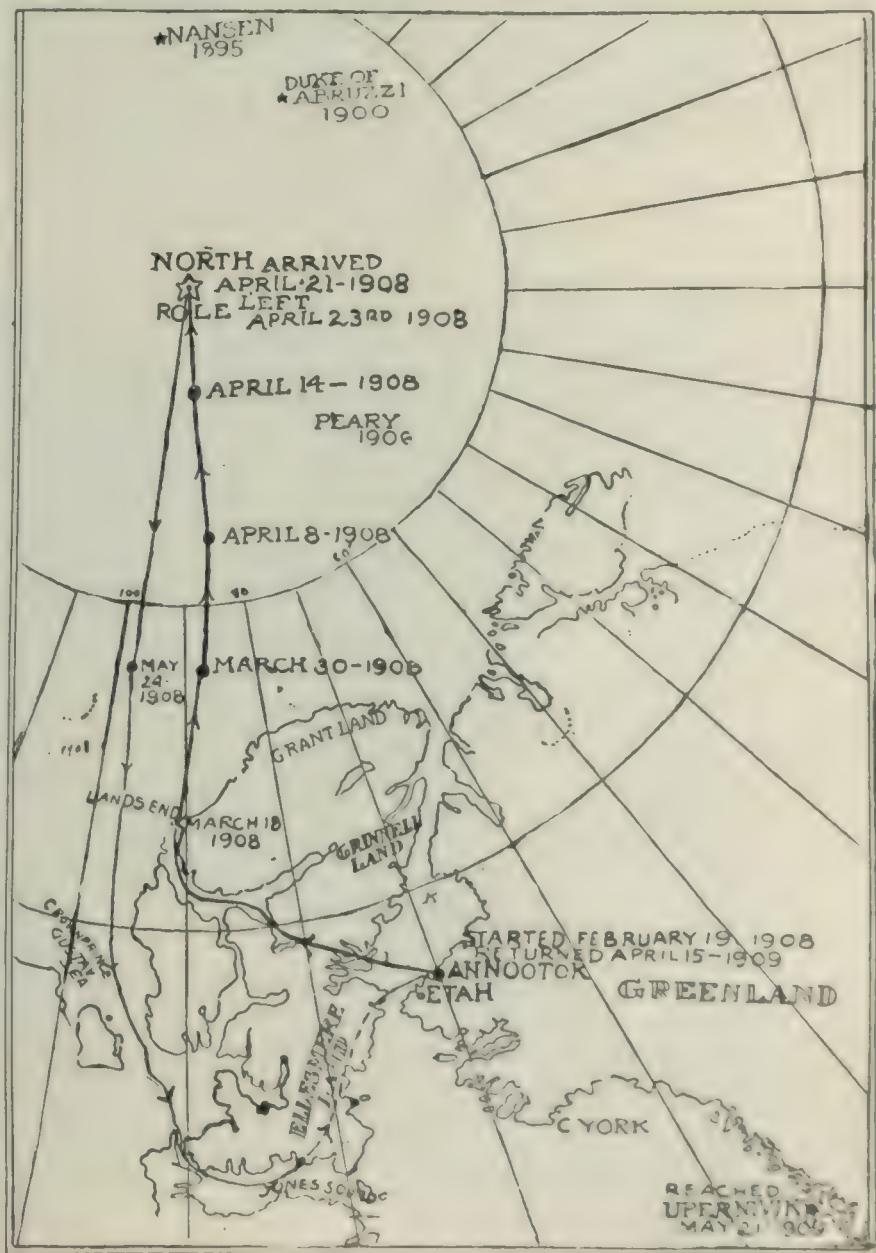

The long race for the Pole ended most sensationally this week by the almost simultaneous announcement from two Americans that they had independently reached the goal. Dr. Frederick A. Cook, a physician of Brooklyn, returned from the arctic regions by the Danish steamer "Hans Egede" and telegraphed from Lerwick that he had reached the North Pole on April 21, 1908. He was outfitted and taken north in the summer of 1907 by

John R. Bradley, of New York, in a fishing schooner of 111 tons equipped with a gasoline engine. The expedition was ostensibly for hunting big game, but provided with all the necessities for a dash for the pole by sledge. The Eskimos at Etah were found well supplied with dogs and walrus meat for them. Dr. Cook was left at Annootok (Annatok) on August 28, 1907, with provisions for three years and lodged in houses made of packing boxes. One white companion, Rudolf Francke, the German steward of the yacht "J. R. Bradley," remained with him until spring, when Dr. Cook sent him back and set out with Eskimos alone. He left Annootok February 29 with eleven men, the same number of sledges and 103 dogs. He crossed Ellesmere Land and went up Nansen Sound, striking north from Heiberg Island. By March 21 the last of the Eskimo had been sent back except two young men, Stuckshook and Ahwelsh, with twenty-three dogs. On March 30, in latitude 84 degrees 17 minutes, longitude 86 degrees 36 minutes, land was observed to the westward, but not explored. Beyond there was nothing but a sea of ice and no traces of life of any kind. The extreme cold caused young ice to form quickly, so remarkably high speed could be made at times. When the observations indicated that the pole had been reached a halt of two days was made before the return journey was begun. The American flag was hoisted and then left in a brass tube. The ice was broken and drifting and there was no evidence of any land. The return journey was long and arduous. Twenty miles a day were made at first, but below the 87th parallel the ice was drifting rapidly eastward and a storm set in lasting three weeks. On May 24, when the sky cleared so an observation could be made, they had reached the 84th parallel, near the 97th meridian. Rations were reduced, and open water and high screw ice cut them off from Nansen Sound. After twenty days in a fog they found themselves far down in Crown Prince Gustav's Sea, to the west of Heiberg Island. No depots could be found and no animals were seen until June 20, when a bear was shot in Ringnesland. They endeavored to reach the

whalers in Lancaster Sound, but had to take refuge in Jones Sound instead, where they past two months in an open boat ten miles from shore. The hundred bullets that they had started with had been reduced to fifteen and they had to use lassos, traps, bows and arrows and spears in hunting game, which, for lack of fuel, had often to be eaten raw. Musk ox was the chief reliance, but bear, fox, wolves and ducks also served for food, fuel and clothing. At Cape Spargo an underground den was prepared and there the three men remained until the sunrise of 1909. On February 18 they started for Annootok, and from there moved south to the Danish settlement of Upernavik, which was reached May 21, 1909.

Dr. Cook's announcement was so surprising to the world and disconcerting to the friends and backers of his rival, Commander Peary, that it was received with considerable incredulity and was denounced in some quarters as a hoax. The points that chiefly aroused skepticism were the unprecedented rapid time made by sledge over the ice to the pole, averaging about 15 miles a day; the long delay in returning to civilization after the feat was accomplished; the absence of any confirmation by other persons, for even the two Eskimos who accompanied him had remained at Etah; the refusal of Dr. Cook to give out details of his observations or show his original notes; and the supposed inadequacy of the means. But the explanation by Mr. Bradley that the expedition was carefully planned and sufficiently well equipped removed the last objection, and Dr. Cook's bearing under the severe cross-exam-

ination by the army of reporters at Copenhagen rather turned the tide of public opinion in his favor. He was received at Copenhagen with the wildest enthusiasm and given a succession of feasts as compensation for his long period of starvation and loneliness. The Danish scientists express their belief in his story and he was warmly received by the King of Denmark. He was at a public dinner in the Tivoli Casino, garlanded with pink roses, when word was received that Peary had returned. He expressed his gratification at Peary's triumph and his confidence that his own statements would now receive corroboration.

MAP SHOWING DR. COOK'S ROUTE TO THE POLE AND RETURN.
According to the *New York Herald*

Dr. Cook's Own Story From Lerwick, Shetland Islands, Dr. Cook cabled, on September 1, to the New York Herald the first full account of his discovery from which we are permitted to make the following extracts:

After a prolonged fight against famine and frost we have at last succeeded in reaching the North Pole. A new highway, with an interesting strip of animated nature, has at last been explored. Big game haunts were located, which will delight the sportsman and extend the Eskimo horizon. Land has been discovered upon which rest the earth's northernmost rocks. A triangle of 30,000 square miles has been cut out of the terrestrial unknown.

The expedition was the outcome of a summer cruise in arctic seas. The yacht "Bradley" arrived at the limits of navigation in Smith Sound late in August, 1907. Here conditions were found favorable to launching a venture for the pole. John R. Bradley liberally supplied from the yacht suitable provisions for local use, and my own equipment for emergencies served well for every purpose of arctic travel.

We were now about 200 miles from the pole and the sled loads were reduced. One dog after another had gone into the stomachs of

the hungry survivors until the teams were considerably reduced, but there seemed to remain a sufficient balance of man and brute to push along into the heart of the mystery to which we had set ourselves. Beyond the eighty-sixth parallel the ice fields became more extensive and heavier, the crevices fewer and less troublesome, with little or no crushed ice thrown up as barriers.

From the eighty-seventh to the eighty-eighth, much to our surprise, came the indication of land ice. For two days we traveled over ice which resembled a glacial surface. The usual sea ice lines of demarkation were absent and there were no hummocks or deep crevices. There was, however no perceptible elevation and no positive sign of land or sea. Observations on the 14th gave latitude 88 degrees 21 minutes and longitude 95 degrees 52 minutes.

We were now less than one hundred miles from the pole. The pack was here more active, but the temperature remained below 40, cement together quickly the new crevices. Young ice spread on the narrow spaces of open water so rapidly that little delay was caused in crossing from one field to another. . . .

In the enforced effort every human strand was strained and at camping time there was no longer sufficient energy to erect a snow shelter, although the temperature still was very low. The silk tent was pressed into service and the chance proved successful.

EXPLORER ROBERT F. PEARY AND HIS ESKIMO DOGS

THE YACHT "ROOSEVELT"

Which carried Commander Robert E. Peary to the Arctic regions and has now brought him back. This photograph was taken near Etah in August, 1908, when the "Roosevelt" was caught in the ice floe.

Slowly but surely we neared the turning point. Good astronomical observations were daily procured to fix the advancing stages. The ice steadily improved, but still there was a depressing monotony of scene, and life had no pleasures, no spiritual recreation, nothing to relieve the steady physical drag of chronic fatigue.

But there came an end to this, as to all things. On April 21 the first corrected altitude of the sun gave 89 degrees 57 minutes 46 seconds.

The pole, therefore, was in sight. We advanced the fourteen seconds, made supplementary observations and prepared to stay long enough to permit a double round of observations. . . . At last, we had pierced the boreal center and the flag had been raised to the coveted breezes of the North Pole.

The day was April 21, 1908. The sun indicated local noon, but time was a negative problem, for here all meridians meet. With a step it was possible to go from one part of the globe to the opposite side. From the hour of midnight to that of midday the latitude was 90, the temperature 38 below zero and the barometer 29.83. North, east and west had vanished. It was south in every direction, but the compass pointing to the magnetic pole was as useful as ever.

Although overjoyed with the success of the conquest, our spirits began to descend on the following day. After all the observations had been taken with a careful study of the local conditions, a sense of intense loneliness came with the further scrutiny of the horizon. What

a cheerless spot to have aroused the ambition of man for so many ages. An endless field of purple snows. No life. No land. No spot to relieve the monotony of frost. We were the only pulsating creatures in a dead world of ice.

Peary Reaches the North Pole

On September 6 news was received from Indian Harbor, Labrador, that Commander Robert E. Peary had discovered the Pole on April 6, 1909. As we go to press no details have been given, for the despatches from Labrador are brief and some of them in cipher. His message to Herbert L. Bridgman, secretary and treasurer of the Peary Arctic Club, was merely "sun," which, according to his private code, meant "Pole reached. The 'Roosevelt' safe." He telegraphed his wife, "I have the D. O. P. and am well, love. All well. Will wire again from Chateau. Bert." Mrs. Peary explains that by "D. O. P." he meant the "darned old pole," "altho possibly the D may stand for a more drastic term." To the Associated Press he telegraphed: "Stars and Stripes nailed to the Pole," and to the New York Yacht Club:

"Steam yacht 'Roosevelt,' flying club burgee, has enabled me to add North Pole to club's other trophies."

For nearly three years Commander Peary has been engaged in Arctic exploration and this is his eighth expedition in the direction of the Pole. His greatest previous success was the attainment on April 21, 1906, when he broke the record by attaining a latitude of 87 degrees 6 minutes. He left New York on this present expedition on July 6, 1908, and sent his last message to the Navy Department from Etah on August 17, 1908. Here the "Roosevelt" landed also some supplies for Dr. Cook in anticipation of his return. Mr. Peary expected to begin his sledge work in February and to follow the north coast of Grantland as far west as Cape Columbia and then strike north. He probably took a more easterly course than Dr. Cook.

Foreign Notes This is a week of triumph in exploration. The Duke of the Abruzzi reached the highest point ever attained in mountain climbing by ascending one of the Himalayas, Mount Godwin-Austen, to an altitude of 24,600 feet above sea-level. He did not reach the summit, which is 3,650 feet higher. The Duke of the Abruzzi is a cousin of the King of Italy and one of the most successful of modern explorers. In 1897 he ascended Mount Elias in Alaska, 18,000 feet high. In 1900 he came within 241 miles of the North Pole. In 1906 he explored the Ruwenzori range in Africa, the famed "Mountains of the Moon."—The deposed Shah of Persia is now at the Russian Legation at Zerpzende. He has been forced to relinquish his estates in the Province of Azerbaijan to the State and will receive a pension of \$180,000 on condition of leaving the country. The Persian Government has banished a large number of the officials of the old régime and reactionary leaders, and, for the rest of its opponents, has issued a proclamation of general amnesty. General Liakhoff, the Russian officer who entered the service of the Shah and with his Cossacks overthrew the Persian Parliament, has returned to the Russian service and has been appointed colonel in a Blahystok regiment.—

In deference to a joint protest of the Powers Mulai Hafid, the Sultan of Morocco, has agreed to put a stop to the further torture of the followers of the Pretender whom he had captured.—No decisive movement against the Riffians has been undertaken by the Spanish in Morocco. Reinforcements in large number are being sent to Melilla. A novelty in Moroccan warfare, an armored automobile battery, is to be employed.—Francisco Ferrer, the Barcelona anarchist who was supposed to have been concerned in the attempt to assassinate the King of Spain on his wedding day, has been arrested for complicity in the recent riots in Catalonia. The state of siege in Barcelona has been raised.—The mutinous demonstration in the Greek army against princely rule has accomplished its aim. Crown Prince Constantine, Commander-in-Chief of the Army, and Prince Nicholas, Inspector-General of Artillery, have resigned their positions, and three other princes have asked for long leaves of absence. The new Premier, M. Mavromichalis, has promised a complete and satisfactory reorganization of the army in accord with the desires of the people.

The Swedish Strike The great Swedish strike was formally called off by the Labor Federation on September 6, the Government having assumed the task of arranging a satisfactory settlement of the difficulties. The strike was practically a failure, for although 285,700 men in almost all trades were out at one time the commercial and social life of the country was not paralyzed but only temporarily impeded. The railroad men voted against going out as a body, and the moderate and non-socialistic workingmen who were drawn into the movement at the start soon made terms with the employers and went back to work. The most remarkable feature of the strike was its peaceableness. There was very little violence or disorder. This is ascribed largely to the closing of the saloons, and the object lesson thus given to the country on the benefits of total abstinence has greatly strengthened the temperance movement.

The Dash to the Pole

BY HERBERT L. BRIDGMAN

[Mr. Bridgman, of the *Brooklyn Standard-Union*, has been for many years an authority on Arctic exploration. He was in command of two Peary exploring expeditions, and is secretary of the Peary Arctic Club.—EDITOR.]

THAT the two Poles, the world's greatest geographical prizes, which have tempted and daunted mankind from the beginning, should be gained within ten months of each other is a coincidence scarcely less remarkable than the achievement itself. That an American gains the North Pole the earlier appeals both to our patriotic pride and sense of the fitness of things, for it had been much the longest and most diligently sought, and while the Irishman in the Antarctic did not actually attain the coveted goal, he so far advanced his country's flag into the unknown, making

and competent scientific staff, who return loaded with data of the highest value, and with the definite determination of the place of the South Magnetic Pole. The announcement that the North Pole, that lure of the centuries, has actually been reached comes so suddenly and from a

DR. FREDERICK A. COOK,

Who claims to be the first to reach the North Pole.

such a brilliant and gallant fight against new and unforeseen obstacles, that by common consent he receives the highest geographical honors, and John Bull cheerfully pays the bills. Shackleton was accompanied, too, by a carefully selected

DR. COOK IN ARCTIC DRESS

quarter so unexpected that intelligent judgment on the fact is difficult. Naturally, writing for the public and forwarding his account by cable, only the personal and popular phases would be presented, and any statement of scientific results or data would be deferred. But Dr. Cook would probably not demand that scientific rank and weight should be given to his expedition. It was simply a duel with nature; man, stripped for the fight, encumbered only with the barest necessities, determined to make a life and death struggle for one thing only, the goal. But the world will ask that science, tho

not directly interested and served, shall verify the claim and shall attest the result. And, therefore, Dr. Cook will doubtless be only too willing to offer the

and without witnesses or testimony or corroboration. What Dr. Cook's achievement is worth must in the present juncture of affairs depend on each man's judg-

DR. COOK IN THE NORTH

data upon which the confirmation of his narrative will rest. Records, diaries, notebooks, locations, courses and all indicia so well known to explorers will be produced and placed with the archives, either in original or in duplicate, of the principal geographic societies of the world.

Had he by any possibility opened any of Peary's cairns at Cape Thomas Hubbard or Cape Columbia, or any of Sverdrup's in his Farthest Land and archipelago, the evidence would be conclusive and all the doubts forever silenced. Reading between the lines and dismissing at once for what they may be worth all the views, opinions and comments with which the papers are now so heavily burdened, the tale stands on tall by itself

ment. Responsible to no scientific society under no service discipline, he is the freest lance that ever entered the Arctic lists, and is exempted from all conditions of obligation and direct responsibility. Sir Clements Markham long ago criticised Peary's methods, and said that science cared little for a man following a dog sledge over the ice. It wants to know and measure currents, temperatures, depths and salinity, the electrical forces and all the other phenomena of Nature, that the laws with which men are familiar may be accurately determined, and in addition all the forms of animal and marine life may be studied. How much in any or all these departments Cook will contribute remains to be seen. It will not be forgotten that Peary took with him last

year a complete equipment from the United States Coast Survey and a special detail for observations which will give our Government unique and unquestioned pre-eminence in this field of research. Cook's narrative shows ample opportunities for complete studies of the Ellesmere land fauna, of the life which sustained his own, and may do much to supplement and enlarge the work of Sverdrup in this most remote, unpopulated and hitherto undisturbed region, apparently the best hunting ground in all the Arctic.

As to the bearing of Cook's work on the future of Arctic exploration Amundsen already gives answer, his transpolar expedition now fitting out in that veteran of the Arctic. Nansen's and Sverdrup's "Fram" will go right on and a year from now will be in the ice north of Siberia heading westward. For Amundsen, discoverer of the North Magnetic Pole, and Cook's Antarctic shipmate in the "Belgica," is but the forerunner of many who will carry on scientific work in the North. Dazzled it may be by distance, by the elusive pole no longer, for it will be necessary to attain it but once, the whole Polar basin is now opened up to intelligent and systematic study, where the laws of Nature may be learned, her processes observed, land and sea definitely delimited and the last unknown area eliminated from the map. Nations will collaborate and cooperate in this work, and the Polar regions—for the same process is going on in the Antarctic—will be definitely included in their proper place in the scientific world, and their books, sealed from the earlier ages, will be opened wide to all the world.

Maybe this is not the time nor place to intrude ethics or etiquette. Yet those who have followed Arctic matters do not forget that Peary made all this possible, and they reserve until the facts are known

their judgment. Eskimo had been trained by him, lands explored and seas charted, and only an unlucky delay of contractors, for which he was in no way responsible, kept him at home in the summer of 1907. Everybody knew the facts; that his work was unfinished, postponed, and the fitting out of the "Bradley" by

Dr. Cook silhouetted against the Arctic sky.

stealth, equipped for field work and stores and supplies for inland and sea ice marches, while, of course, within the prescriptive rights of the owner, invite remark among men who respect honor and observe fair play.

Peary's plans were all as open as the day and all his countrymen

knew that fifteen years of dauntless and undaunted work in which he had accomplished many times more than all who had preceded him were to be crowned by one final attempt to reach the coveted goal of centuries. That his men, methods and reasonings should all be ap-

propriated and the long struggle finished before he had had his fair and final opportunity is a transaction upon which the American people will render just judgment when they know all the facts. And in the meantime the past is already secure. Patience and more light.

BROOKLYN, N. Y.

St. Michael's Star

(A Hymn for Labor Day)

BY BLISS CARMAN

IN the pure solitude of dusk
One star is set to shine
Above the sundown's dying rose,
A lamp above a shrine.
It is the star of Michael lit
In the minster of the sun,
That every toiling hand may give
Thanks for the day's work done.

For when the almighty word went forth
To bid creation be,—
The glimmering star-tracks on the blue,
The tide-belts on the sea,—
Perfect as planned, from Michael's hand
The lasting hills arose,
Their bases on the poppled plain,
Their peaks in bannered snows.

Cedar and thorn and oak were born;
Green fiddleheads uncurled
In the spring woods; gold addertongues
Came forth to glad the world;—
The magic of the punctual seeds,
Each with its pregnant powers,
As the lord Michael fashioned them
To keep their days and hours.

Frail fins to ride the monstrous tide,
Soft wings to poise and gleam,
He formed the pageant tribe by tribe
As vivid as a dream.
And still must his beneficence
Renew, create, sustain,
The species of the good and true,
The alchemy of the rain.

Flourishing with God, the kindly seed
Yearns through the summer days
With the mute eloquence of flowers,
Its only means of praise.
At dusk and dawn the tranquil hills
Throb to the song of birds,
And all the dim blue silence thrills
To transport not of words.

For earth must breed to spirit's need,
Clay to the finer clay,
That soul thru sense find recompense
And rapture on her way.
And man, from dust and dreaming wrought,
To all things must impart
The trend and likeness of his thought,
The passion of his heart.

The love and lore he shall acquire
To word and deed must dare;
Resemblances to God his Sire
His voice and mien must bear.
His children's children shall portray
The skill which he bestows
On living; and what life must mean
His craftsman's instinct knows.

Line upon line and tone by tone,
The visioned form he gives
To sound and color, word and stone
Takes loveliness and lives.
He sees his project's soaring hope
Grow substance, and expand
To measure a diviner scope
Beneath his patient hand.

To pencil, brush, and burnisher
His wizardry he lends,
And to the care of lathe and loom
His secret he commends.
In hues and forms and cadences
New beauty he instils,
A brother by the right of craft
To Michael of the hills.

NEW CANAAN, CONN.

What Do the Newport Suffrage Meetings Mean?

BY IDA HUSTED HARPER

CHAIRMAN NATIONAL WOMAN SUFFRAGE PRESS COMMITTEE

THE answer to the above question is far from unanimous. One excited advocate of the "cause" exclaimed at a public gathering, "How can we save our movement from the plutocrats?" and

things." But the *Baltimore Sun*, in a long editorial, declares: "If the Four Hundred are to enlist under the banner of woman suffrage, the country may be on the eve of a revolution which will

Copyright, 1905, by Underwood & Underwood, New York

MRS. O. H. P. BELMONT AND THE REV. ANNA SHAW
TOGETHER AT NEWPORT

President Anna Howard Shaw replied, "Heretofore we have been very successful; they seemed never to have heard of it." The *Washington Star* says: "Danger lies that way. It would be better to meet in New York City in hired rooms and have the reports of the proceedings go out from a number on a business street where practical people are doing

shake the very foundations of our institutions." Possibly the majority of the leading papers have expressed an opinion on one side or the other. Individual suffragists have "viewed with alarm" or "seen with pride" according to their temperament. The principal suffrage paper, the *Woman's Journal*, approves, and its veteran editor, Henry B. Blackwell, came

down from Boston to attend the first meeting. Dr. Shaw, the national president, was a speaker, as was Mrs. Julia Ward Howe, "last of the pioneers."

For a number of years the chief obstacle to woman suffrage has been not opposition but indifference. Few of the influential newspapers actually oppose it; they simply do not notice it. The large body of thinking women are not hostile to it; they are merely indifferent. Public sentiment in general can be aroused only by the newspapers. There has not been anything especially new or interesting in the suffrage movement, so they have left it alone and public opinion has stagnated. Women as a rule take up the activities that offer least resistance—first the church, then clubs, patriotic societies, and finally various kinds of civic work. Suffrage, for many obvious reasons, has been not only unpopular, but the way made as difficult as possible for those who espoused it. As a result women in the mass have directed their energies toward every other conceivable object and left the suffrage side-tracked. Consequently a vital necessity existed for giving the newspapers something to talk about, and

making suffrage popular enough for the average woman not to be afraid to favor it. Have the Newport meetings accomplished these two purposes?

On August 22 the *New York Herald*, a leading paper on two continents, contained two pages about the prospective meetings in Marble House, and the powerful *New York Times* had almost a page on Mrs. Oliver H. P. Belmont's plans to further the cause of woman suffrage. In the week preceding, the *New York* papers had published columns on these subjects; and the press associations had telegraphed about them to every newspaper in the country; in the two days following there was scarcely one that did not print notices of the forthcoming lectures at Marble House. On the days of the meetings all the large papers of New York and Boston had reporters and artists present and the Associated Press worked overtime. The next day after each, scores of big papers printed full pages, half pages and columns of reports with illustrations, and such headlines as Suffrage in a Palace; Triumph for Equal Rights; Social Leaders Flock to Study Suffrage; Equal Suf-

frage the Slogan; Society Throngs Marble House to Hear the Suffragists; Woman Suffrage Party a Great Success. The accounts were dignified and accurate, the addresses given almost in full and predictions made as to the many city houses which would be opened for similar ones during the coming winter. Every paper in the United States published the press dispatches and many had editorial comment. The expenditure of thousands upon thousands of dollars could not have secured such advertising, and yet it was obtained without the payment of one dollar. In past years scores of suffrage meetings have been held far surpassing these because there were many able speakers instead of one, and they were wholly ignored by the press or ridiculed and misrepresented, while the devoted adherents of the cause were entirely without the means of influencing public sentiment in its favor.

It is upon women themselves that the effect of these successful meetings will be most apparent. Thousands of them in all parts of the country are thinking more seriously upon the suffrage question than ever before, but they have seen such ridicule and contempt heaped upon

its advocates that their reluctance even to investigate it is not in the least surprising. Their tendency to rush into whatever becomes fashionable is to be deplored, but just now the most important thing is to make the movement for woman suffrage respectable enough for them to come into it without being subjected to what has been endured by its supporters of the past two generations. No one can deny the vast influence which these Newport meetings will have toward that end on the women of all classes. They might injure a cause which depended on men for its support, but they will help it with women, and a great need of this movement today is for larger numbers of women to come openly and fearlessly into the ranks.

In the wide publicity they have gained, the approving comment they have evoked and the favorable impression they have made upon women, we must conclude that these Marble House meetings have been fully justified.

There is, however, another aspect of the question which demands consideration. With the fields growing ripe for the harvest the work for woman suffrage has been crippled on every hand by the

lack of funds to print and circulate literature, to send out speakers and organizers, to assist State campaigns, to do the thousand and one things absolutely necessary to the success of any movement. This one always has been confined to what is known as the middle classes, women of earnestness and energy but with small financial means. In some communities there have been a few with larger incomes, but none of great wealth. This is equally true of all reforms. Even under these circumstances it is astonishing how much money has been raised and how great a work has been done—steady, persistent, consecrated work, whose direct results are seen in the present advanced status of the question. The time has now come when it is imperative to have larger funds. Officers serving without salaries and struggling to make their living expenses by outside effort, the intermittent service of volunteer workers, are no longer sufficient for the vastly increasing demands. There must be obtained from some source a great deal of money for the strictly legitimate purposes essential to success. It is foolish to ignore or deny this fact.

Consider, for instance, the wage-earning women of the country. For many years after the movement for suffrage began there were practically no women working outside the home; now there are millions; they are recognized as an important economic factor and, thru their trade unions, they are becoming an immense power. Without any teaching except in the school of experience the majority of them have learned that women ought to have the vote. If properly organized and brought into relation with the officially constituted suffrage associations they would be a tremendous force. They have not themselves, however, the time or money to effect this organization, establish headquarters, hire halls, etc., and they must have the co-operation of other women who can supply what they lack. This is but one of many instances which show that the principal need of the woman suffrage movement at the present time is the money for the necessary work.

Last winter Mrs. Belmont, who had retired from social life because of a personal bereavement, found time to make

a study of this subject in which she had long had an academic interest. With the thoroughness and business acumen for which she is noted she asked some of the leaders to come and help her understand the situation. After one or two interviews she said, "Why are you not asking us wealthy women for money?"

"Because," was the answer, "we think that after you know the needs of the work you will not have to be asked."

"What do you want most just now?" was the next question, with the reply:

"Suitable headquarters in New York City, where the large newspapers, the press associations and many people of wealth and generosity are located." Within a week Mrs. Belmont had opened a separate bank account for this purpose, and the names of the men and women who, at her solicitation, have contributed toward it would be a revelation to the public. As a result there will be opened this month woman suffrage headquarters comprising an entire floor of nine rooms in a handsome new office building, 505 Fifth avenue, near Forty-second street. The National Association was invited to occupy five of these rooms at whatever rental it felt able to pay; two were offered to the New York State Association for which they will be at no expense whatever; two Mrs. Belmont has reserved for a society which she is forming for special work. The National Press Bureau will be located on this floor and its two rooms furnished by her. The private office of Dr. Shaw will be furnished by Mrs. William M. Ivins, and that of Mrs. Ella Hawley Crossett, State president, by Mrs. Henry Villard, only daughter of William Lloyd Garrison. Both of these ladies have given much assistance to the cause of woman suffrage for many years. The two associations will continue the work which they have been trying to do under less favorable conditions, and this, of course, without the slightest jurisdiction of any one outside.

As national and State work was now to be conducted in New York City on a large scale, Mrs. Belmont realized the necessity of interesting the men and women of this city who could give it the greatest impetus thru wealth and social power; hence the brave decision to have

those meetings at Marble House. It did require considerable courage, for it is said that not half a dozen members of this famous summer colony, made up almost wholly of New Yorkers, believed in woman suffrage or approved her advocacy of it. If every man's house is his castle surely every woman's house is her home and she is entitled to its privacy. It demanded a spirit of real sacrifice to throw open to the general public this one with its exquisite finishing and furnishing, taking the chances of a stormy day. The criticism of the five dollar tickets is unfounded, as the money was for suffrage work, and admission to the beautiful grounds and the lecture itself was only one dollar, which by no means covered the actual expenses. Nobody with less social influence could have brought those indifferent pleasure seekers to listen for two afternoons to the undiluted doctrine of woman suffrage. As a result some who were radically opposed declared themselves fully converted; some were interested to the point of saying they should certainly attend the lectures to be given in New York next winter; others at once offered their drawing rooms for these lectures, and still others made contributions of money before leaving the grounds. The permanent residents of Newport and the surrounding towns have been utterly dead on this

question in spite of the strenuous efforts of the Rhode Island Suffrage Association to arouse them, but they flocked to the Marble House lectures—500 the first day, 700 the second, according to the newspapers.

If it all should end here it would still have been quite worth while, but will it end here? "A mere society fad," say the scoffing; "a pretty diversion for a summer day." Let us wait till next summer before we try to answer. For the present there are the headquarters guaranteed for two years; four big mass meetings arranged for New York City and smaller ones too numerous to count; "suffrage centers" planned for all sections of the city; a campaign thruout the State; something more than a "thinking part" in the election of State Assemblymen; 2,000 women going to Albany for the "hearing" this winter instead of 1,000 as last session.

The greatest need just now is a live, aggressive suffrage newspaper, published in New York, independent in its policies and free from all control except that of the National Association. If this should materialize in the near future as the direct result of influences set to work at the Marble House meetings, would those who are decrying them accept it as a justification?

NEW YORK CITY

The Cross on the Hospital

BY EDWARD TALLMADGE ROOT

MANGLED or fevered or wan are its guests; and thru sunshine and rain,
Over the Inn of the Suffering gleameth the Symbol of Pain!

Here, with the kindness of Science, how deft are the fingers that move!
Over the House of the Merciful shineth the Symbol of Love.

Baffling our skill, ah, how many here draw their last agonized breath!
Over Life's ultimate Refuge there riseth the Symbol of Death.

Death? Yea; but Who, on the cross, gave His life, as a Victor Divine?
O'er this new Deed of the Christ, lo! there towereth the Conqueror's Sign!

PROVIDENCE, R. I.

A New Helicon Hall

BY UPTON SINCLAIR

VOLUME 1 OF "THE JUNGLE," ETC.

IT has been a trifle over three years since I published in THE INDEPENDENT an article entitled "A Home Colony," the result of which was the starting of the Helicon Hall experiment. Since we were burned out, many of our old members have written to me and urged me to start again; but I have so far withstood the temptation. For one thing, I found that the enterprise required the entire time of one man to run it; and that man ought not to be a person who is chafing inwardly because of novels and plays that he is being prevented from writing. My experience convinced me that a co-operative home is a practicable thing, and that some man will make it "go" before very long; but also it convinced me that I am not the man.

More important yet, my way of life has undergone a very radical change in the last two years; the domestic problem no longer presses upon me or my family. I shall explain this at some length, for the reason that it bears directly upon the new enterprise which I am undertaking.

It is the "servant problem" which will drive people into the co-operative homes; it was that problem which brought our "home-colonists" together. They were literary people, who could not afford hotel life and were too sensitive for boarding-house life. The novelty of Helicon Hall and its social opportunities attracted them; but more than anything else, they wanted their three meals cooked and the dishes washed, without their having the bother. And most of the energies of those who were running the colony—myself included—went to the ordering and serving of food, and the cleaning up afterward. We started out with a brave attempt to have no servants; but we soon found that the cooking was too hard a job for the college girl who had undertaken it, and that the college boys who agreed to scrape the pots and kettles did not scrape half as vigorously as they should have. So in the end we had to get regular servants, even though we

continued to try to treat them as "fellow-colonists."

That was one of our tragic insincerities. Another was the "simplicity" of our life. Itinerant journalists who happened in on our "bean day" made fun of our scanty *ménu*; but as a matter of fact, we served quite an elaborate table, and still without being able to satisfy every one. We were always in trouble because this or that cog of our *cuisine* machinery kept getting out of place; and I recall that on several occasions the colonists spent their time at our weekly meetings in discussing whether human beings could survive without soft boiled eggs on Sunday mornings.

After the fire, and the strain and worry caused by serious financial losses, I was in very bad health, and my wife in even worse. So for the first time in my life I began to pay serious attention to the question of diet. A good many of the members of the colony had been vegetarians before they came there; but we had served meat for the meat-eaters, and the result was that all the vegetarians had fallen from grace. Now, however, I became a vegetarian "for keeps"; living for the most part on the "germ-proof" food preparations of Dr. Kellogg, of the Battle Creek Sanitarium. That helped me some—but very little. Last fall I found myself in such a condition of nervous exhaustion that I went away by myself to California, vowing that I would not come back to my family and my friends until I had made myself a well man.

I got a little bungalow; and because I did not want to have to bother with a servant, and wanted to be alone at meal times, I took to eating food that did not have to be cooked. I could not get the prepared stuff I had been eating, but I was in a land of fruits and fresh vegetables, and so I lived on these. In this blind way, and quite without guidance, I stumbled on what I now know to be the greatest discovery of my life: the deadly

nature of the cooking process, which destroys the health-giving properties of foods, incites to gluttony, and is the cause of 95 per cent. of the diseases of the human race. Owen Meredith is author of the statement that "civilized man cannot live without cooks." It is my conviction that civilized man is dying because of cooks.

I used a kind of hard whole-wheat cracker; but for this, I ate no cooked food for five months. I lived on nuts, ripe olives, salad vegetables, and a variety of "the kindly fruits of the earth," both fresh and dried. I was indoors most of the time, for the climate was vile—it rained nearly every day all winter thru. And I worked harder than I had ever worked in my life before; and yet my troubles fell from me like a cast-off garment. My stomach ceased from growling, my sluggish intestines awoke, my nerves became calm, and my headaches were forgotten. I was a picture of radiant and rejoicing health. "I like to see you walk up the street," said a lady of my acquaintance. "You seem to be having such a fine time."

I started out for home again, and I began giving lectures and accepting invitations; and that meant "hospitality," and midnight suppers, and ice cream and cake and candy and all the rest. In two weeks I had a headache, in two more I had a cold, and in another I was lying in a hospital in Key West, Fla., with sunstroke and fever.

So, when I reached New York, I was ill; and my wife was ill also. And we came out here to Battle Creek, and put ourselves into the hands of Bernarr Macfadden, who understands these things. We took a fast—my wife went ten days with very little trouble, and I went twelve with no trouble at all. And so we are thoroly cleansed of all our ailments, and are on the "raw diet" again. We have put on ten or fifteen pounds of extra muscle, and are setting out for a lifetime of perfect health. And if anybody ever sees us putting cooked food into our mouths again, we will thank him to remind us.

In the beginning it was all blind experiment with me. But now I have a theory of it. We are descended from arboreal ancestors; and whoever saw a

fire in a tree? We have the teeth of a nut and fruit eating animal; we have a stomach of that size, and a colon intended for all sorts of waste—fibers, seeds and skins. And now we refine and concentrate our foods, eliminating all this waste; we cook them to make them soft and mushy so that they slip down without mastication; and we combine them in ten thousand artful ways to incite us to gluttony; and the result is that before we have filled our stomach-pouch and satisfied our chewing-impulse, we have taken into our system from three to four times as much nutriment as we need. The balance ferments and decays, and supports bacteria. I once had a count of one hundred and twenty billion to the ounce of intestinal contents, and my wife (after a siege of appendicitis) two hundred and seventy billions! The resulting poisons flood the system, and the upshot is some one of the countless "diseases" of which the medical books give the symptoms without hinting at the cause.

There is only one law of health—after you have fasted and got a new start. That is, to eat every food you eat in the state in which you find it in Nature, with no preparation whatever, save washing it clean. And any reader who has ever had anything to do with "domestic science," whether in a co-operative home or a private family, can imagine the change in one's life consequent upon the adopting of such a rule. For five months in California, I never saw a greasy dish; and all my housekeeping consisted in taking some things out of paper bags, washing them till they were shiny and gorgeously beautiful, and afterward rinsing off a couple of plates under a spigot. So now you can guess why my family is not making plans to set up another Helicon Hall.

Of all the problems which we had to solve there, there is but one which still presses upon us, and that is the problem of our little boy, now almost eight years old. We are still preoccupied literary folk, and the boy is still solitary, and missing the life we desire for him. Now and then we have to go to New York; and we do not consider a big city a place for a child. And in the country, he either plays alone, or else goes with companions who tempt him with cake and candy and

soda water, and all the rest of our civilized abominations. I was brought up on such things myself, and so was David; and when he sees them he craves them. On the other hand, when he is with us he never thinks of them but eats with perfect relish whatever natural food it put before him.

When I came back from California, David was having cooked vegetables and fruits, and bread and butter, and plenty of milk and eggs; and he was rather pale, and his tongue was coated and his breath was unclean. I put him on a diet of nuts and fruits exclusively, and in three days the bad symptoms had disappeared, and his cheeks were full of color. Thereafter he gained in weight at the rate of two pounds a month; until he began traveling about again, and visiting round, and eating white bread, and eggs, and other poison foods.

We did not solve the health problem at Helicon Hall, and perhaps we did not solve the servant problem. But there was one we did solve, as every one agreed without exception—the problem of the children. We had thirteen youngsters, and they had a little world all of their own; a place to sleep and a place to eat and a place to play. They learned to dress themselves and serve their own food. They played together and were blissfully happy all the day long. It was a little children's heaven; and David has never forgotten it—he talks about it and sighs for it even yet. And as for us, it was the one time in our lives when we were able to give our child what we considered he needed; and we can never be at peace again until we have it permanently. So we are going to start a new Helicon Hall, this time to be all "children's department"; we intend to organize a co-operative home for *boys*.

While I was in California I spent two months as the guest of Mrs. Dell H. Munger, who was living in Palo Alto, her eldest son being a senior at Stanford. This lady was a picture of superb and radiant health, and I was astonished to learn that for ten years and more she had been a bedridden sufferer from intestinal catarrhal and rheumatic disorders—having cured herself by a long fast. I interested her in my theory of raw foods, with the result that she and her family

adopted that way of life and thrived upon it—including her youngest child, a boy of David's age. I found in this lady a keen mind and an eager interest in all questions of vital importance. We talked about everything under the sun, and among other things about education; we found that we had each the same problem, and that we were absolutely at one in everything concerning the welfare of our children.

And when I came home and found David unoccupied and restless and discontented, I wrote to Mrs. Munger, with the result that she has agreed to come East and take charge of my proposed "Home Colony School." She has spent the greater part of her life upon a farm, where she managed a household and raised a family. For several years she was president and active manager of a bank in Indian Territory. Consequently I shall have now what I did not have at Helicon Hall—a person of business judgment and experience to whom I can entrust the full charge of the enterprise. As authors are uncomfortable folks to have in a house full of boys, my wife and I will get ourselves a cottage nearby; but we shall give all our spare time to the school, and we shall consider it as our home and as the home of our boy. Incidentally it will be the home of from six to twelve other boys, whose parents happen to be of the same way of thinking as ourselves.

We shall content ourselves with renting a building for the first year; after we have shown what can be done, we shall raise the capital and build upon a larger scale. We shall get a roomy house, with plenty of air and sunlight, and furnish it with the utmost simplicity. We shall be ready to start some time in October of the present year. Our school will probably run all the year round, with brief vacations.

Of all the ideals we shall set before ourselves, the first is that of perfect and permanent health. Not such health as boys generally have, with coated tongues always, and colds and stomach troubles now and then, and assorted "children's diseases" at intervals; not such health as is had by the average school child, who sits in a stuffy room all day and pores over books; nor such health as boys have

in boarding schools, where they are fed on meat and candy and pastry and cake, and so trained in self-indulgence, and prepared for cigarets and beer and smut. I mean health which is permanent and complete, defying all disease and all exposure; and which is conscious and deliberate, based upon a knowledge of the body and its laws, and an ideal of absolute self-mastery. We shall teach health as a religion, the necessary basis of all right feeling; and in our teaching we shall not forget sex health. We shall train our boys to the use of cold water and to vigorous exercise in the open air in all states of the weather. We shall guide them in games and contests, in base ball, swimming, skating and walking.

Personally I care very little about book-learning for young children. I believe that they should develop their bodies and learn thru the hand and eye. I would have gardening and nature-study, the latter while wandering about in the woods and fields collecting. I would have the children learn to sing beautiful songs and hear poetry and stories read aloud; I would have their minds filled with images of joy and beauty—with the myths and legends of all times, and with the noble deeds of men and women. There is scarcely a field of human knowledge which can not be thus made interesting to them, if presented by a person with a living imagination. For the rest, if they spend an hour or so every day in learning to read and write, I shall be satisfied with their education.

I consider the presence of servants demoralizing to every human being, but to children utterly ruinous. Children are natural democrats; and when we teach them the class lines, we begin their corruption. We shall teach our boys to take care of themselves, not only as a matter of economy, but as a matter of morals; to wash and dress themselves, to keep their rooms in order, and to prepare and

serve their own food. We shall have an abundance of the best food, and in sufficient variety; but we shall make it a rule not to serve more than four or five articles of food at one meal. We shall weigh our boys regularly and see that every one of them is gaining properly, and is looking and feeling at his best; and we will make regular reports, for the benefit of those parents who may be dubious about our diet.

Such a school as I propose can, of course, be conducted at far less cost than the ordinary boarding school. When we know how many boys are offered, we shall be able to set a definite price. It will be payable quarterly, in advance, and I think should not exceed \$25 or \$30 a month. The school will not be a money making affair, but a co-operative arrangement among the parents, to secure advantages for our children. Mrs. Munger will be paid a moderate compensation for her services. I will not receive anything, either now or at any future time. The price named will be figured to allow about 10 per cent. profit, which will be used, first to pay off the expenses incidental to the starting of the enterprise, and afterward to the extending of the work. I will pay for my boy just what the others pay. My interest in the plan is to show what can be done with children under proper conditions; and I feel certain that the idea will be taken up by others and carried out in larger undertakings.

I shall be glad to hear at once from parents and others who may be interested; and also from a teacher who would be interested in our way of life, and is competent to teach singing and nature subjects. For the present we desire boys between the ages of eight and ten. It will not take us very long to organize, and we shall set to work as soon as we have heard from a sufficient number of parents.

PAUL CRONIN, M.D.

The Negro in a Democracy

BY RAY STANNARD BAKER

[Mr. Baker is one of the best known magazine writers of the country and has devoted many years to the investigation of American social conditions, among them a study of the negro problem, given in his book, "Following the Color Line." He is now one of the editors of that progressive monthly, *The American Magazine*.—EDITOR.]

THE Supreme Court of the United States recently handed down what is likely to become one of the most important decisions in its history; that in the case of Berea College, of Kentucky. For the first time we have a definite decision of the United States Supreme Court upon the discrimination against negroes in the South. The majority of the court upholds the Kentucky law which forbids the co-education of white and colored people.

Of this decision Justice Harlan says in a minority opinion

"Have we become so inoculated with prejudice of race that an American Government, professedly based on the principles of freedom and charged with the protection of all citizens alike, can make distinction between such citizens in the matter of their association for innocent purposes simply because of their respective races? Further, if the lower court be right, then a State may make it a crime for white and colored persons to frequent the same market places at the same time, or appear in an assemblage of citizens convened to consider questions of a public or political nature in which all citizens, without regard to race, are equally interested. Many other illustrations might be given to show the mischievous, not to say cruel, character of the statute in question, and how inconsistent such legislation is with the great principle of the equality of citizens before the law."

By its decision the Supreme Court of the United States thus enters upon the problem of the limitation of democracy in America, and it upholds, tho guardedly and in a limited sense, the position of the South on the negro question.

And the position of the South is one of unbelief in a democracy which includes both white and colored people.

Once while I was traveling in Georgia I fell into an argument with a thoughtful man whom I was visiting upon the future of the negro in America. He said to me:

"Our experience with the negro here in the South since the war convinces us that after all the democracy of which our

forefathers dreamed is an impossibility. There is and can be no equality between negroes and white men, and we might as well admit it."

He went on to review the familiar assertions concerning the masses of negroes in the South; their dense ignorance, their irresponsibility, their vices and crimes. "We are meeting these conditions," he said, "by frank legislation which looks to the limitation of democracy. Politically we have the disfranchisement laws, socially we have the 'Jim Crow' laws. We see here in the South that while democracy is possible for white men, it is impossible for white and colored men together. We have no unkind feeling for the negroes. We are quite willing that they should build up a democracy of their own, if they can, but it must be apart from our white democracy."

In these remarks my friend express the sincere conviction not only of the Southern white people, but of many Northern white people as well. Indeed, there prevails in the land a vital new concern in the limitations of democracy, express now in the decision of the United States Supreme Court to which I have referred. A large number of people, like those in the South, believe that we are trying to extend the limits of democracy too far; on the other hand, no small number of people believe that we have never gone far enough; that democracy, like Christianity, has never really been tried.

Let us not be confused, in this discussion, by statute book democracy. Democracy is not law, not customs, nor institutions. Democracy is a *spirit*. And if that spirit does not prevail among our people, should we retain laws on the statute books which we do not intend to obey? The white South has never believed in giving the vote to the negro; it has never believed that the negro

should possess real civil rights; its law books, so far as the spirit of the white South is concerned, have been full of lies. Distrust of the laws in this particular, habitual disobedience wherever the negro is concerned, has spread until it has affected every human relationship. Men resort to personal vengeance instead of seeking the courts. The "unwritten law" is more potent than the written law, nightriders burn and kill and hang without punishment.

Travel in the South and you will find, as I found, most of the ablest and truest men urging the limitation of the franchise laws as applied to the negro, and commending the separation of the races in cars, schools, railroad stations and the like. They feel that the laws should conform to the facts in the case; that men do not become democratic because democratic laws are on the statute books.

No, we must go deeper than statute-book democracy. We must apply our tests not to the written laws or customs; we must make inquiry concerning the spirit which underlies them.

The South does not now believe and never has believed in a democracy which applies to every man regardless of race, religion or condition. But neither does the North. Undoubtedly the North possesses more of the democratic spirit than the South; and yet, studying the growth of negro communities in Northern cities, I am convinced that if we had anything like the proportion of negroes that the South struggles with, we should also find ourselves developing a spirit not unlike that of the South. Lynchings, mob-law, discrimination, prejudice, are not unknown today in the North. I found discrimination and separation growing even in Boston, and I could not find that mob-law in Springfield, Ohio, was any less ferocious than in Huntsfield, Alabama. The same spirit which drives the man with the colored face out of certain counties in Indiana is found burning negro colleges in Texas.

We of the North do not, most of us, believe in any real sense in a democracy which includes black men as well as white men.

If there were enough colored voters in New York to carry the city, or even to exercise a balance of power, and they

all voted one ticket as they do in the South, disfranchisement would immediately become an important issue. As it is, we are contented to disfranchise most of our negro voters at every election by bribery. Let us be willing to face the truth, and not cast stones at our Southern neighbors. The plain fact is, most of us in the North do not believe in any real democracy as between white and colored men. Nor do we believe in it among our own white people, for we are divided into warring classes and societies. Nor does the negro on his part believe in it, for no line among white people is more strictly drawn than the line, in some localities, between the mulatto and his black brother. I have known negroes as intolerably aristocratic in their prejudices as any white men I have had the pleasure of meeting.

The point I am making here is that the *spirit* of democracy, which, after all, is the only thing that really counts, is not exhausted with exercise anywhere in this land. We have made a little relative progress toward democracy; we have expressed its shining ideal in some of our institutions, but for the most part the human heart of us is woefully aristocratic, ungenerous, prejudiced, and it expresses its haughtiness not only in the South, where the negro suffers most, but in the North, where we employ swarms of underpaid women and children, and build selfish palaces out of the labor of wretched foreigners. We have no stones to cast at the South. This is our problem, too. I have heard much talk against the passage of the disfranchisement and "Jim Crow" laws, in the South, but I cannot consider them without feeling that whatever else they may express, they also constitute a genuine protest against the lie of the law. The Supreme Court decision in the Berea College case has been attacked in some quarters, but does it not represent the real view of the mass of American citizens? In Chicago, in St. Paul, in Boston, white parents do not often want their children to sit in schools where many negroes attend. This is the plain truth.

But a tremendous endowment of power follows any effort to arrive at the real truth of things. Thus the discussion in the South regarding the limitation of

democracy on the statute books has opened the question as to where, having begun to limit, the line shall henceforth be drawn. If you study the political campaigns in the South, if you read the proceedings of the recent legislatures of Southern States, you will discover that, however blindly, the discussions have turned upon these questions:

How many colored men can be cut off from participation in the political rights of the democracy? How many seats at the rear of the car shall the negroes occupy? At what door shall the negro enter the railroad station? Shall negroes be confined in the same prisons with white men, or take the oath with their hands on the same Bible, or be buried in the same cemeteries? How many parts of white blood shall admit a negro to real participation in the democracy? What occupation must negroes pursue in the democracy? Some would compel them all to be servants, others would admit them as small business men but not as professional men, others still would let them practise medicine *if* they practise only among their own people.

All these discussions may seem amusingly trivial to the outsider who cannot understand that they are, after all, profoundly and fundamentally educative.

Think what a tremendous experimental laboratory in applied democracy is this South of ours! A whole people trying to draw an elusive line between some men who belong and some who do not! In each legislature, in each campaign, the line wavers, is broken down at some point, is newly drawn. Some awful event like the Atlanta riot comes along and the best white men and the best negroes, who have never come together or known one another, are irresistibly forced into common effort. A white man says: "I did not know there were any such intelligent negroes in the country." Another asks: "After all, are we not brothers?"

Or some man arises—a liberator, like Booker T. Washington—who will not be classified, who breaks thru many lines. "What shall be done with such a man?" these campaigners and legislators ask themselves. "He serves the South. He is useful to all of us. How can we legislate such a man out of the democracy?"

But can we let him in and keep out the dark-skinned man who follows close behind?"

So these Southern men are concerning themselves with real questions; they are being driven onward by the tremendous logic of events. They will see sooner, perhaps, than we see the utter absurdity and impossibility of limiting a democracy. It must either be democracy or else a caste system or graded aristocracy, which, if it is forced, will petrify our civilization as it has petrified that of India. Once an attempt is made to draw lines and it is discovered that the whole attention of the people is centered, as it is today in the South, on drawing and re-drawing the lines—to let a few more in or to keep a few more out. So we shall discover in time and by painful experience that if the negro does not fit into our present sort of democracy, it is not the negro who is wrong, but the democracy. The final test of any democracy is its humblest citizen.

Science has taught us that every atom is necessary to every other atom in the universe. It is also teaching us that every human being is necessary to every other human being; that there can be no real democracy which leaves any one out. Emerson says, somewhere: "To science there is no poison; to botany no weed; to chemistry no dirt." To this we may add: "To democracy, no negro."

Let me not be misunderstood. Some people think that democracy means that men must necessarily eat together, or marry one another, or indulge in some other curious ritualistic proof of equality. A dinner-table is made the test of the philosophy of government and civilization! Could anything be more trivial? Let me emphasize again that democracy is not a code of social laws: democracy is a *spirit*.

No word has been more misunderstood in this connection than the word equality. The equality of men, the superiority or inferiority of men—what do they mean? I never yet have seen any two men who were equal in any outward particular whatsoever. I have met white men and white women and black men and yellow men, and lawyers and plumbers and artists and preachers and street cleaners, but I have never yet been assured of any

superiority or inferiority. I don't know how that is to be settled. Surely not at a dinner-table or by different seats in the same car!

There is just one sort of equality that we can finally recognize, and that is the spiritual equality of efficiency. Does a man do his unselfish best at his job? If he does, he is the equal of any man on earth; he belongs here; he is a necessary person, for that is the sort of equality of men which is meant by democracy.

I have seen in the South the black man serving the white man, but I have seen in the South a reluctance on the part of the white man to return that service. I have heard the familiar argument, the divine right argument, that God in his wisdom made a special people who are white in color to live easily, fare softly, sleep quietly, while another people who are dark colored do all the hard work and suffer in ignorance. But democracy on its way downward is curiously unobservant of special privileges, however bolstered by appeals to divine law; it does not believe that one man or a group of men has a monopoly of God's gifts or his smiles; for democracy looks humbly for efficiency and when it finds the man who is a good servant it makes *him* the ruler and hero. No, the place of the negro in the democracy is the place he can fill most efficiently.

Thus the spirit of democracy is the spirit of common effort and sympathy between different sorts of people. In its essence it is intensely religious, and it is the only thing that will finally solve the negro question in the South. I have heard absurd talk of exportation, segregation, extermination—quack remedies every one, the mere temporizing with which delays the cure.

What I say here is not visionary. I do not believe that men can be made over by sudden revolutions. The human soul does not change quickly. It must meet sorry experiences and go through the travail of thought. I wish I had some exciting or sensational remedy to propose. I might stir people to enthusiasm; but I have no such exciting message. I have only to offer certain more or less platitudinous suggestions: that we cannot look for laws to accomplish what the spirit back of them does not warrant.

The spirit of true democracy is faint in this country; and it is not surprising that the United States Supreme Court should express what the people feel. What we need is a revival of the *spirit* of democracy, both South and North. How can this be attained? Again only by old-fashioned remedies: I mean by education and the passionate preaching of the religion of service.

Hearing these commonplace things suggested, some of us grow weary; the way seems so long and so hard. What we really need is new fervor in our work along these lines. It is not enough to believe; there must burn behind that belief the true fire of faith. If I have any message to deliver today it lies in the reinforcement of our conviction that these old remedies are the true remedies.

But by education I do not mean that sort of training which means soft hands and an ability to spend money; but the training which means hard hands and the production of some good thing. And not for negroes only would I commend that kind of education, but for white boys and girls as well. The trouble with most of the education of white people in the country today is that it trains men away from the common life, not into it. I have visited scores of colleges in the South and I have seen none where the work meant as much in the development of democracy as that at Hampton, Tuskegee and other schools of that type.

One of the finest tendencies I know of in the North today is the effort to introduce instruction in agriculture and the mechanical arts in the common schools. Let us have farming and Greek and stock-raising and philosophy taught side by side in all the schools! All are necessary in a democratic state and no one of them should be held in contempt.

It is curious once a man (any man, white or black) learns to do his job well how he somehow finds himself in a democratic relationship with other men. I remember asking a prominent white citizen of a town in central Georgia if he knew anything about Tuskegee. He said:

"Yes, I had a rather curious experience last fall. I was building a hotel and couldn't get any one to do the plastering as I wanted it done. One day I saw two negro plasterers at work in a new house

that a friend of mine was building. I watched them for an hour. They seemed to know their trade. I invited them to come over and see me. They came, took the contract for my work, hired a white man to carry mortar at a dollar a day, and when they got thru it was the best job of plastering in town. I found that they had learned their trade at Tuskegee. They averaged four dollars a day each in wages. We tried to get them to locate in our town, but they went back to school."

When I was in Mississippi a prominent white banker showed me his business letter heads.

"Good job, isn't it?" he said. "A negro printer did it. He wrote to me asking if he might bid on my work. I replied that altho I had known him a long time I couldn't give him the job merely because he was a negro. He

told me to forget his color and said that if he couldn't do as good a job and do it as cheap as any white man, he didn't want it. I let him try. Now he does all of our printing."

It seems to me that these little stories contain the germ of the new truth, the new democracy, in which a man shall be judged by what he can do. The wisest leaders in the South, both white and black, are turning aside from the old noisy ways of the agitator and are getting down to the work of education, doing real things in a real world.

What we need today is not less democracy, but more democracy. We need the constant re-assertion of the validity of the highest ideals of democracy: the sort of democracy which leaves no man out. That must be our religion from now on.

NEW YORK CITY.

Senator Aldrich

BY WILLARD FRENCH

OUT of the smoke and dust of the tariff fight every one, from the President down, has emerged more or less perplexed and uncertain as to just "where he is at," and convinced that the most important part of the fight lies yet before him—explanatory and apologetic. Constituents do not seem so enthusiastically with them as they thought. Democrats and Republicans, insurgents and insurged, all are finding that they lost something of the proper perspective at close range, in the heat of the conflict, and are chiefly concerned, just now, in efforts to convert those for whom they thought they were fighting—all but one. Just one of the six hundred combatants knew before the start exactly where he would finish and came out of the fight precisely as he expected—just one: Nelson W. Aldrich—the most disliked and the best abused of all participants in the fray.

Senator Aldrich has been muck-raked from the cradle up, assailed, arraigned and denounced—with more or less fire

for so much smoke—but he has never explained or apologized—and he never will. He undertook tariff revision knowing perfectly well that he was distinctly "it" and practically all there was to it. He knew that he would be personally denounced, the country over, for whatever there was in the tariff that any one disliked. He knew the platform, pledged for revision downward, and the President's campaign promises, all for revision downward. He went at the revision with the quiet assurance which is Aldrich, and from start to finish he revised *upward*—upward, no matter what any one may say to the contrary—upward in all features where the upward pleasantly affected the great "interests" of the country, and downward where the downward was innocuous or agreeable. More gently than the often quoted railway magnate, concerning "the public," because he is by nature more gentle, Aldrich remarked of the people: "The consumer be—obliterated." And in spite of President, progressives, Demo-

crats, platform and promises, he revised the way he wanted to, passed the bill thru both Houses, saw it signed by the President, and left at once for his magnificent summer home at Warwick Neck, R. I., with a genial smile upon his lips, a merry twinkle in his eye, and the very best of good feeling in his heart toward every living human being on the earth.

The most disliked and the best abused citizen of the United States to-day, with enemies galore—the vast majority among them—Aldrich is no man's enemy. Bitterness and hatred are absolutely foreign to his nature. Papa Cannon is vindictive. He punishes insurgents in more ways than one. The quality of the man is all that counts in Aldrich's estimates. He does not care a straw what that man may have said or done against him, even on the floor of the Senate. He is always friendly toward every one—only he is more friendly toward some than toward others—and if any human being ever followed faithfully the instincts of friendship for people and principles, with his eyes shut to all conflicting considerations, that man is Aldrich. He knows as well as you that the world at large hates him, and better than you that to attempt to reform it would be hopeless. He could not reform himself, when what he is is the result of his sincere and earnest convictions, whatever others may think and say. He scrupulously avoids newspapers and magazines that he may not read the ugly things they say of him, and if you call his attention to any of them he simply smiles—he has one of the pleasantest smiles extant—and turns your attention to something else. He never loses his temper or sends a single vindictive compliment toward his detractors. He is exquisitely polite. He can be gently sarcastic. He is often courteously cutting—but he never loses his temper. During the last months of tariff revision,

while he was assailed and battered by press and public, and most of all by his fellow members on the floor of the Senate, the question was on every tongue: "How does Aldrich keep from getting mad?"

Well, how does he? And how can he do all the rest that he does? Simply because he is Aldrich. Be he good, bad, or indif—no, he could not be indiffer-

NELSON W. ALDRICH
Senator from Rhode Island

ent in anything—be it good or be it bad in him it is *facile princeps*. He is a man without a peer and he knows it. As tho it were a new discovery it is heralded against Aldrich that he is a plutocrat—as well patent the announcement that a white man is white. It exudes from every pore of the man. Some men are born great, some achieve greatness, etc. Aldrich achieved plutocracy. Along the

path by which he came there are many little incidents in which muck-rakers revel; but, whether they have the right or wrong of it, Aldrich today is an unostentatious, earnest, honest plutocrat. His associations and affiliations are plutocratic. His friendships and principles are plutocratic. When he frames his financial bill, two years hence, he will not only favor a central national bank, but one that will strengthen the power of the national banks, especially the national reserve banks. He can't help it. It is his honest conviction. On the other hand, his marvelously keen common sense is a balance wheel which his detractors fail to appreciate. It is noteworthy, too, that among his staunchest followers and most consistent admirers in the Senate are men as far as possible from plutocratic tendencies, and so far as general legislation is concerned there is very little which ever dangerously appeals to plutocratic tendencies. It only indicates the general trend of legislative and political positions which Aldrich naturally takes, favoring the great financial interests of the country, as, in his honest opinion, the best course for national and party prosperity.

Aldrich is often spoken of as the leader of the Senate, but a leader he is not. A leader is followed because he is popular. Aldrich is not popular. A leader is the foremost fighter. Aldrich is not a fighter—not like Foraker, for example, who would stand by his guns the more fiercely and ferociously as his chances of success grew less. Aldrich keeps a sharp eye on the enemy and many a time he has beaten a graceful retreat, only to appear again with the same bill under another dress—or after some of the opposition had been quietly converted behind the scenes—and carry it to success. His currency bill, in the last Congress, was lost. Aldrich was beaten. Another bill was sent over from the House. When it was presented to the Senate, Aldrich rose, in his inimitably quiet way, and offered an amendment striking out all after the first clause of the bill and substituting what was really his own old bill. The only difference was that in the meantime he had "found the votes"—that is a favorite expression of his—and the amendment was carried

supported in conference, with a few trivial changes which made no difference, and became a law.

Neither is Aldrich a stand-patter, like Cannon, with whom he is so often classed. It is a mistake. Even in their control and dictation they are as different as daylight and darkness. Aldrich is the very essence of delicacy and diplomatic design. He stands pat on nothing. He knows what he wants. He goes for it by every means and method at his command. "Unscrupulous" is a word that is often used concerning him by those whom he has vanquished; but when it is intended to convey a charge of fraud or deception it is emphatically the wrong word to apply to Senator Aldrich in any of his legislative dealings which have come under my observation—and I have watched him very closely for the last half-dozen years, at least. Unscrupulous he is if the word means looking out for the interests he advocates and letting others look out for theirs. He steps where the best interest of measures he favors indicates and others must look to it for themselves that their toes are not trodden on.

A leader he is not. A stand-patter he is not. But what he is is a manipulator and organizer, a keen-eyed, marvelously shrewd, farseeing manager of men and things: level headed, imperturbable, unmagnetic, but a man of marvelously clear, cold, domineering, executive ability. He knows what he wants and he gets all he can of it. His invariable calmness and good nature are not artificial. Nothing disturbs him. When the tariff fight waged its fiercest and he was made the target for every blow, he would quietly slip away from the Senate, if a set speech was under way and there was no chance of a vote, go over to the new office building, where the Finance Committee has an elaborate array of rooms, shut himself in the one devoted to his individual use, quietly lie down and take a nap. In the prostrating heat, when the end was at last positively in view, I came upon the Senator looking as cool and fresh as if he were on the deck of his yacht. I said to him:

"You must be very tired, Senator, and glad that adjournment is fixed."

"No, indeed, I am not tired," he said

pleasantly. "I shall be glad, for the business interests of the country, to have the tariff matter settled; and it is growing a little monotonous; but I am not tired," and he was not. There was not a man in the Senate but looked more fagged. Then when the end came and he started for his beautiful Warwick it was precisely the same as when he took a nap. He directed his clerks not to forward to him any mail except what was strictly personal. He left the whole business behind him, and if I am sure of anything I am sure that he immediately forgot all about it as thoroly as he would forget a winter suit when he turned to a spring wardrobe.

But to judge from this that Aldrich is in any way indifferent or indolent is the greatest mistake that could be made. No man upon the floor of the Senate is better informed. He is a walking cyclopedia. No man is more alert or quicker or keener in debate. He is a parliamentarian to the tips of his fingers; a politician dyed in the wool, a statesman without fear or friendships. When things were looking dark for him in the Senate and every one seemed up in arms, when the rumor of insurgent support from the White House gained ground, and, according to gossip, Crane brought him the startling news that the last poll showed a possible majority of two against the bill, Aldrich slipped quietly away and up to the White House. In an hour he was back again, calm and smiling. What he said to the President of course is not officially knowable, but it was something like this: "You must keep your hands off or you will disrupt the party and rouse an antagonism which will be more disastrous at the polls than it will be to the bill. The success or failure of the bill is only a question of finding the votes. So far I have found them. The others will win if they find them. It is a dangerous policy for a Republican President to antagonize the majority of his party by open advocacy of measures which can only be carried by a few insurgents aided by Democratic votes."

The following votes showed the same old majority—from eight to a dozen—which Aldrich held from the beginning to the end, with very few exceptions.

Nevertheless, Aldrich left for Warwick not in the least elated, knowing, as he knew from the beginning, that he was the best disliked and the best abused American at large, still shrugging his shoulders and smiling, and when a friend ventured to suggest an explanation, a defense, or an apology, always making the same reply, "What's the use?"

And for the other fellow, too, What's the use? You may hate Aldrich and you may hit him, but you can't hurt him. For public opinion he cares not a straw. He is as firmly founded in Rhode Island as the eternal hills. They may not love him. They may not worship him. But they know that the interests of the State are better off in his hands than they could possibly be in any other—and so they are. He is as firmly founded in the Senate. Insurgents may insurg, ranters may rant, earnest and sincere progressives may progress to the limit, but except what Aldrich voluntarily yields to them they will not receive; neither will they displace him till he voluntarily retires—which now seems probable in 1911. Moreover, it is safe to say that the one thing which will prevent his retirement at the end of the present term—if anything prevents it—will be the demands of his colleagues, absolutely insisting that he remain. They will demand it, because it will be so obvious, little tho many of them love him, that there is not in the Senate or the country a man who can fill his place. Some individual Senators think themselves perfectly adequate and capable; but no other Senator thinks so of them. No one can be suggested who would not have an overwhelming majority in opposition. But there must be some one at the head.

For every combination, corporation, club, there is a dictator. Neither anarchy nor nihilism could be without a controlling czar, and centralization of power is the cause and effect of successful dictatorship. The Senate has always had a dictator and always will have one, and the man best fitted for the position will hold it, in time if he remains in the body long enough to make the club. Aldrich is not what he is by any accident or political chicanery. He came to the Senate nearly twenty-eight years ago

from four years' service in the House, and before that he had served conspicuously in his State Legislature. It is the judgment of a lifetime, of his constituents, and the judgment of more than a quarter of a century of his Senatorial colleagues—weightier than the snapshot conclusions of muck-rakers—which has placed him where he is. He has reached the position of autocrat and dictator by the slow process of promotion accorded him by his colleagues, because he was the man for the place. He is as indifferent to opinions in the Senate as out of it. Measures are what he considers and votes are what he counts. If he advocates a measure which you favor you will kneel at his feet and acknowledge that he is the greatest of living statesmen—if not, you will join the progressives and say all of the other things you can think of. Either way you will be more than half right. But not Clay or Calhoun, Benton, Douglas or Fessenden, not even Webster with his gigantic brain and matchless eloquence, ever possessed the power in the United States Senate which today rests with Nelson Wilmarth Aldrich. And yet, in that hot-bed of legal ability, he is not a lawyer—*sub rosa*, he is not even much of a scholar. He prefers the reports of the Fall River mills to classic literature, and commercial interests to signaling Mars. He seldom argues on the floor of the Senate, but those who say he does not speak because he can't are wide of the mark. They have forgotten times in history when occasions required him and he rose to them, grappling the greatest men in the House and the Senate and winning out every time. They have forgotten the time he tangled Spooner, only three years back, and the times he has forced Bailey from the field. Aldrich can speak when he wants to, but he rare-

ly wants to. He is better satisfied quietly to dominate.

He thinks, moves, acts, speaks with the nervous alertness of a busy business man—which is precisely what he is: always erect, always smiling, always with the self-reliant grace of one who thoroly understands himself. His hair and mustache are white, his high forehead is bald—but they do not carry a sense of age. He will not be seventy till 1911. He is rich beyond counting, irrefragably a gentleman, quiet, unobtrusive, always courteous, never cordial or particularly friendly to the world at large. In business he never takes any one into his confidence—least of all newspaper reporters. He is not at all fond of society—beyond the society of his home, which, with his absolutely charming wife and seven or eight sons and daughters, has been something closely approaching the ideal, and betrays the secret of the inimitable good nature and the ready smile which are so distinctly Aldrich. He is fond of bridge, fond of yachting, fond of being let alone, fond of Warwick Neck. But I believe, if the truth were told—a truth which possibly Aldrich himself does not fully appreciate—he is fonder still of being the target for anathemas, the center of the field, the autocrat of the Senate. No man on earth is better posted on principles and policies of finance than Aldrich, and he has an ambition, before retiring, to couple his name with Alexander Hamilton, in a bill which shall place our currency and banking system upon a scientific basis, a model for the world—which it is not today. Beyond that no aspiration, no ambition, no excuse but the innate and inherent love of it, could account for Aldrich being what he is, the best disliked and the best abused man in America.

WILLIAM S. DICK

The European Idea of the American Girl

BY RUTH CRANSTON

[Miss Cranston, after her graduation at the Women's College, of Baltimore, a year or so has been traveling over Europe by herself and we imagine, therefore, that she has had good opportunities to collect data for the following article. She is a daughter of Bishop Cranston, of the Methodist Church.—EDITOR.]

TRUTHFUL analysis of the present attitude of Europeans toward the American girl of today involves some surprise, more indignation, and still more uncomfortable query; that the present idea should exist, that it should be so deep-rooted, and whether or not it is justified, are the questions which present themselves to the consideration of every thinking person who is brought into any intimacy with European culture. It is contact with the foreign viewpoint which alone furnishes further reason for adding to the enormous accumulation of manuscript dealing with the American girl. Already she has been so over-written, so literally overdrawn, so over-exalted, that some excuse is due for bringing her once more into the limelight. To turn a new perspective upon the national idol—a perspective which lays bare its woodenness under all the brave gilt array, and which, tho partially misdirected, is yet so novel to the popular American idea as to shame patriotic prejudice—that is the purpose of the present discussion. To give a clear, if necessarily general idea of how the modern American girl appears to the mass of Europeans, and to show how that idea originated, in how far it is justified, and how it can be uprooted, may perhaps bring enlightenment not only to the fondly deluded American public, but also to the meek American parent. True, this last has made no strenuous objection to the present bureaucracy of youth which undisputed rules American life; perhaps to educate the parent is the really urgent reform, and one which might be effected by forcing upon him outside criticism of his daughter's personality. Those people who see her where, because "no one knows me," she is most natural—rather when only she is natural—are surely more competent to judge her than those

whose vision has been warped thru near-sightedness.

I think that in that brief phrase, "No one knows me," lies the explanation of the status of the American girl in Europe—at least, action based on such an assurance is apt to count as derogatory evidence in the summing up of a national character. And while the difference between the popular European conclusion and actual truth is appreciable, it is a difference merely of proportion. "The American girl is a well-groomed, assertive, totally illiterate composition of good looks and bad manners," said a diplomat who has lapses of frankness. "She is an evolution of all that great wealth and self-effacing parents with no grandfathers could combine to produce. With none of the European girl's fresh innocence, she has an ignorance of all affairs outside herself which amounts to an exaggeration of the European girl's lack of sophistry. She has all the hardness of a woman of the world, with none of the charm or real intelligence which cloaks most worldly women's bald knowledge. She is simply the disconcerting product of a hybrid civilization." There you have the common European estimate in sum! Chafe at it, argue it, work yourself into a rage over it—it is all the same; any one who has traveled abroad with even one eye and ear in commission will testify that it is there, and that it is by this time deep-rooted. The reason for its development lies in the development of the American girl during the last fifteen years; for fifteen years ago both she and her rating were of a different value than now. Then she had not abused the fine opportunities of which opportunity was beginning to be prodigal, then she had not turned higher education into an excuse for primary frolic and subsequent ego-

men, then she had not sold herself by the dozen to impecunious and invariably contemptuous nobility, then she had not made of her freedom a stepping-stone to audacity, nor of her camaraderie an excuse for adventure. If we look at the whole question fairly, if we are sincere enough to go back to original causes, we cannot help confessing that the American girl has worked out her own fall from cosmopolitan grace, has by her own ridiculous arrogance torn her pedestal from under her, so that she can only regain it by a much longer progress of re-creating world opinion.

At present there are continuously thousands of girls on the Continent—studying, traveling, working at various professions, and just drifting. The last class, while notably the most dangerous, is fortunately in the minority, while the large proportion of girls abroad come chaperoned by mothers or older women, supposedly competent to look after them. The actual amount of protection afforded by these chaperones is, however, a questionable quantity; not only are American girls notoriously impatient of all restraint or advice, but American mothers, aunts and older friends are not always so conscious of their responsibility as could be desired. In the first place, neither they nor their charges have, as a rule, the faintest idea of European customs and institutions. Coming abroad for a few months or a year, they take no trouble to find out what the Romans will expect of them in Rome; hence it is small wonder that they commit blunders which are regarded by Europeans at first as humorous, later as vulgar. In the same light that a New Yorker would see an apparently well-educated foreigner who showed marked predilection for the dance halls of the Tenderloin does the cultured European see those hosts of Americans who manifest unbounded fascination for Maxim's or the Moulin Rouge, or any other of those favorite baits for tourists, to which no decent European girl would be taken under any circumstances. That chaperones not only countenance but approve such expeditions is the first of American incomprehensibilities to foreigners. That the girls themselves have a desire to look upon mere filth, have moreover a curiosity about it which is nothing short of

morbid, is bound to lower them for all time in the eyes of a world unblinded by patriotic loyalty. When they are not uncompromisingly labeled as degenerates, and as such relegated to a lower sphere of society, they are laughed at as silly pleasure-seekers, with no force of character and little sense.

In a large Italian *pension* I chanced to overhear two conversations which bore out this point only too clearly. The first dialogue was between a carefully (?) chaperoned Boston girl and an Italian officer, and if space permitted, would be reproduced here as one of the most artistic bits of shallow flirtation ever accomplished in that line. At any rate, the general impression gathered from the conversation, which took place in a public writing-room, in the presence of two entire strangers, was that the lieutenant spent each of the twenty-four shining hours in ardent adoration at the shrine of "la bella Americana," and that no infernal torture or heavenly bliss could ever erase her image from his heart. There was more of it, but that was the substance, and it evidently tickled the jaded conceit of Miss Boston mightily. A few minutes after she had left the room her conquest was joined by another Latin, to whom he gave a synopsis of the interview, in graphic, amused Italian, concluding: "They are all alike, these American girls; a little ingenuity, a little flattery, and you have them! They are all the same."

With the shamed sense of belonging to a class in disgrace, I asked a girl who had lived in Italy twenty years just what was the extent of that opinion. She looked at me a moment, half disgustedly, half indignantly, then she said tersely: "From one end of the Continent to the other! American girls are held as playthings, empty-headed little geese, whose mothers have no better sense than they."

After all, who could wonder at it? Relying on their nationality to carry them thru the forbidden places, they have reduced to a tawdry instrument that fine birthright which should have served as an aid to self-denial. But it is characteristic of the modern American girl's training that it leaves her so completely self-conscious that she has no consciousness left for community feeling, no realization of others outside of I. The pa-

triotism which moves her to wear a small satin flag on her coat lapel leaves her unstirred when it comes to sacrificing personal inclination to national reputation. If it were not cowardly it would be marvelous, the way she has seized upon every institution, every principle, every fetish of the nation as tools for the satisfaction of her egotism. Of course, she has been abetted always by doting parents and tactful acquaintances, but still she has always been capable of managing her own campaign—that is one of her greatest faults, over-capability. That is one reason for the European criticism of her manners, because she manages any older person with whom she happens to be in contact in such a way as to leave the impression that *she* is the important factor, the real meaning of things.

This is especially the case with girls traveling alone with their mothers or chaperones. When they are bunched together in schools or in parties, individuals have less scope to wield the executive. Nevertheless they do not fail to add their full quota to American unpopularity. One Frenchwoman told me that in the last three years the Continent has been overrun with so-called "traveling schools," made up of one or two dozen attractive, ignorant girls from newly rich families, and conducted by women whose own culture is of the near-refined type. With hundreds of such specimens at large over the country, is it any wonder that Americans in general, and American girls in particular, are ticketed crude and illiterate, and shut hopelessly out of the best European circles?

Turning to the student class of expatriates, we have cause for less pity and more shame. In America thousands of girls study art and music in large cities, away from home, but only very rarely does one of them degenerate as do the mass of girl students abroad. I have the testimony not only of Europeans, but of any number of American men and women, that the average student—or at least one out of every three—who comes over perfectly self-respecting, and with all the principles incident to careful home training, has at the end of six months developed into an unconventional, lax-minded, if not completely immoral creature. The existence of this state of affairs is brought keenly home

to the girl who happens to be the exception; while the easy argument, "Oh, an American girl can do *anything*," is enough of itself to humiliate every one of the species. Yet this idea is seized upon as an excuse for any sort of an escapade, and by men as well as girls, for inevitable with the degeneration of American girls abroad comes the co-degeneration of American men. With their ideals of their own countrywomen swept away, they seem to have nothing left to fall back on. This one fact should pull the heedless girl student up short. She says she has just as much right to smoke, to drink absinthe, to frequent *risqué* restaurants, as the man whose equal she is. Perhaps, yet the question of "right" is as much distorted as it is disputed by women all over the world today. As long as the American girl continues to assert and to grasp, as long as she maintains her present position of the eternal recipient, so long will she fail to appreciate that she is destroying the immortality of her so-called rights by refusing to give of their benefits, by cheapening them into mere excuses for weakness.

To believe in the right to do as she pleases, to fly in the face of world-old custom with a flippancy which precludes all suggestion of sincere social reform, means also that she comes out of the situation with her reputation a bit threadbare for her flight, and with her fine edges dulled by careless rather than intelligent contact with the world. This idea of fond parents that their daughters are being "polished off" in Europe is a great joke among foreigners, who can never understand, in the first place, how the daughters were allowed to come. That they do come, and in ever-increasing hordes, gives them constantly greater power to model European opinion; and this they are accomplishing not wisely, but so much too well that it is doubtful if their work can ever be undone. Here is a large student class, strangely demoralized by new environment into ultra-unconventional Bohemians; here is also a large class of indiscriminating tourists, eager to see everything, no matter of what color; here are dozens of misnamed schools, founded without regard to the first principles of education—really, one can hardly take exception to the

European prejudice against American crudity, to the European antagonism to the American girl.

I have completely passed over the numbers of professional young women and the adventuresses who yearly flood the Continental capitals. The former class has its own peculiarities and its own genius, both of which combine to gain for it a judgment independent of nationality. While of the latter, the less said the better; it is made up of a pitiable collection of aimless drifters, seeking nothing higher than the comforts of a parasitic existence, and who can hardly be classed as Americans, so cosmopolitan is their existence. There is enough cause for dismay if we confine our attention to the American girl *en masse*—to which, be it understood, there are not a few fine exceptions. The writer pleads the very highest patriotism in presenting the present exposition of a class to which she herself belongs. Not out of prudery or any sense of superiority has her conviction developed—surely nothing is more despicable than the expatriate who is barely out of sight of his own land when he begins to constitute himself as censor of it by reason of his cosmopolitanism—but rather has it been the painful evolution of observation and intimacy with Europeans of all countries during years of foreign travel. And it must be borne in mind by all indignant patriots who read these unpleasant truths that they deal always with the *average* girl, who nevertheless may not impossibly be your favorite exception!

That the entire degeneration of the American girl's reputation abroad has been as unnecessary as it has been deplorable makes it all the more reason why it should now be brought to her realization. If she could be imprest with the fact of the existence of other customs, other conventionalities than those of her own nation, with the fact that recognition is due the institutions of the people of one's residence—if not as a matter of good manners, then as a matter of diplomacy—she would have the first syllable of the commendrum called the way out. Her natural cleverness, even tho' maimed by abuse, should teach her that the reason of her unpopularity abroad will eventually be the reason of her downfall from the pedestal at home.

If she is actuated only by the desire to retain her supremacy—the lowest of all motives of reform—it is time for her to X-ray her present position; if she hopes ever to re-establish herself in the place she held in Europe two decades ago, it is time and long past time to start healing past breaches. For the sake of the many genuine American girls whose graciousness and culture are overlooked thru the arrogance and audacity of the mass, for the sake of maintaining the dignity of the enviable status of women in America, for the paramount sake of real patriotism, doesn't it seem time that the idol should be dethroned at least for overhauling?

If we get back to original causes, we must confess that it is a nation's worship which has spoiled the American girl. Fifteen years ago she was so unusual, so charming in her unobtrusive independence, so brilliant in her self-reliant yet modest womanhood, that her superiority over the *jeune fille* of the Old World turned the nation's head. Consequently, in characteristic American fashion, and with no thought of the reaction on her individuality, she was petted and praised from the front sheets of the Sunday papers straight thru profusely illustrated magazines and "art" calendars to the padded pages of the latest novel. Literally, today, she can hardly pick up any sort of reading matter without being cloyantly flattered in the most barefaced manner. A few months of this sort of exaltation and a child becomes unbearable; over a dozen years of it and a young woman becomes not only that, but pitiable. The only counteraction for the mistake is to let her feel her limitations. If for five months the American press would turn its attention to the American mother, or, better still, the American father, it would leaven present distorted sentiment amazingly. Singular indeed has been the relegation of the American parent to the position of provider and onlooker, while the nation has throbbed and toiled and circled round its orbit for the younger generation, particularly the feminine contingent. With the exception of a dozen or so semi-ironical verses which appear annually, with the regularity of panamas and bathing suits, precious little is said about the drudgery of the American father. When he fails in

business, or is convicted of graft, society sighs compassionately over the scourging of his poor wife and daughters. Always the women, and usually the younger women!

I confess I do not see that the present dominion of the weaker sex in the United States is so vastly superior to the supremacy of the stronger in the Old World. At least the offspring of the new civilization are no more satisfactory; they need educating on a radically different plan from that now in practice. But first, American parents need educating. All of their self-assertion seems to have dwindled out of the finger tips of the hands reached so often into their pockets for more allowance for Maud, or a new motor car for George. To use the vernacular of the unappreciative recipients of all this sacrifice, let Maud and George hustle for themselves for a while. No race or class or individual ever was the worse for being severely snubbed; if it is worth anything, it turns around on itself and thinks. If it isn't, it stays put. In many colleges there is a system of rushing Freshmen till they are spoiled into egotism, then of absolutely ignoring them till finally their verdant rawness is worked into mellow upper classhood. The wisdom of such a system is naturally a matter of dispute, but the necessity of following out the sequence once it is started cannot be argued. If the American people have, to the best of their ability, succeeded in rushing the American girl into egotism, they surely owe it to her now to "rub it in" that she is spoiled and miseducated and ungracious, by simply ignoring her save as any ordinary member of society. Only by this process will her really wonderful energies be controlled into organized, common sense, working power; only this way can her own values, her own perspective, be so toned as to change her individuality and the world's estimate of her.

Such a reform is surely worth while from an objective point of view—the present European idea of our girls is of itself humiliation sufficient to prove that — but it is still more worth while from a subjective standpoint. For while the opinion of the world counts much in the formation of character, the opinion of

one's best self counts more, and a best self that is forever negative in its criticism soon loses influence. The American girl's unpopularity with Europeans has been largely a matter of the disintegration of her own self-respect into an aggressive flightiness which the genuine honesty of her nature could not consistently countenance. Give her something positive as a foundation for introspection, some definite quality of character on which to base the future of her individuality, and she will make of it a finer thing than any product of flattery and superlative praise. Nothing can be more deadening to the growth of any creature than to cry its perfection when it is only a quarter of the way upon its evolution; if our girls had any of the true philosophy of life's several ages, if they had been brought to recognize the entire superiority of seventy over seventeen, they would lose much of the arrogance for which Europeans criticise them, at the same time acquiring a much happier and more serene conception of life for themselves.

In whatever light the problem is regarded, a prompt revolution insists upon its expediency. For the reason that the European idea is so firmly rooted, that the American fathers have been shoved out of their rightful place, above all for the reason of her own cheapened womanhood, should the American girl make use of her really splendid sincerity, and come to her senses. No girl in the world has had her advantages and her opportunities, no girl in the world has a larger share of native cleverness and clear-sightedness. To have everything and then misuse it! Surely her future spells something finer than careless degeneration, surely it holds for her a wider influence than petty tyranny over her own country, a broader womanliness than is compassed by the lax code of egotistical heedlessness. But the next decade must prove it, for her great chance is vanishing; if she does not hurry to grasp it, it will soon be out of sight. To assert something better than her independence, to raise on high some more worthy fetish than her own conceit, is the mission of the American girl who is a true American.

A Great Work on Peace

IN our review of Professor Hull's volume on the "Two Hague Conferences" last December, we said:

"Professor Hull has given us an admirable commentary and summary of the Conferences, but the philosophy of the Conferences, showing their place in history, and the part they are to play in federating the world is yet to be written."

In the two ponderous volumes before us Professor Scott has amply supplied the want. As Professor of International Law in various great universities before he became Solicitor of the State Department, as editor of the *American Journal of International Law*, as technical delegate to the Second Hague Conference, and as an active and sincere worker in the American peace movement, no man could have a better equipment for the task. His work has more than fulfilled expectations. It shows not only the precision and balance of the scholar, the force of the statesman, but even the vision of the prophet. The work is monumental. It places the author in the very front rank of living publicists.

In the first volume the author traces in detail the history of the peace movement down to the First Hague Conference, "the Magna Charta of International Law," and then devotes the bulk of his space to the two great conferences. After several chapters on "the next steps" to be taken by the future conferences as well as by the governments and peoples of the world in their journey toward universal peace he concludes the volume with an admirable appendix of some forty original documents, all milestones in the history of that movement, whose aim is to substitute law for war. In the second volume Professor Scott has collected all the official documents pertaining to the First and Second Hague Conferences, from the Czar's famous rescript down thru the full texts of both

conferences to the American delegations' final report to the State Department.

The reader must not suppose, however, that the work is predominantly historical. While the text unfolds in historical sequence, there is hardly a page unilluminated by critical comment or the tracing of analogies between the law of individuals and the law of nations. The work is interpretive and philosophical rather than historical.

Professor Scott is at his best in those chapters where he makes such comparisons as those between the trial by battle and modern warfare, common law and international law, the Court in Article IX of the Articles of Confederation of 1781 and the Hague Court, the United States and the united nations. He says the world has seen three types of international conference:

(1) The conference at the end of war to arrange for terms of peace, (2) the conference called in times of peace to humanize and regulate future war, and (3) the conference meeting in time of peace to prevent war by eliminating its probable causes, namely by arbitration.

Arbitration, too, in international law has its counterpart in common law. We quote him in full here as this is the first time, we believe, that the analogy has been so clearly expounded:

"There are three stages in the development of the Roman judicial system (1) the private litigant submitted his controversy to an arbiter of his own choice . . . (2) the magistrate or judge chosen from an official list or panel is preferred to a citizen arbitrator; (3) the administration of justice is regarded as the duty and therefore the right of the state, and a judicial system is prepared for and imposed upon the citizen.

"Is not the same unconscious development seen in the growth of arbitration between States? As independent beings they chose arbitrators, the Pope in times past, a foreign sovereign in modern times; the consciousness of the defects of this system in which the individual case is decided, but continuity of decision is wholly lacking has led to the second stage, which dates from the first Conference, namely, the appointment by international action of a panel of judges from whom the judges forming the temporary tribunal are chosen. We stand upon the very threshold of the third and final development when the

"The Hague Peace Conferences of 1899 and 1907." By James M. Scott. Columbia University. The Hague Peace Conference, Vol. I, pp. 1-100. The Hague Peace Conference, Vol. II, pp. 101-200. Baltimore: The Johns Hopkins Press, 1911.

nations as a whole determine that international justice is the province of the international community and constitute a court of international justice to which litigant States may resort in conflicts of importance. The foundations of this international tribunal are already laid; its organization, its jurisdiction, its procedure have been determined, and we only await the appointment of judges in order to establish the court of arbitral justice, in which the nations of the world may obtain justice as easily and readily as private suitors in national courts of justice."

When Professor Scott comes to the discussion of the Hague Conferences he is not afraid to look forward to the probability of their turning from diplomatic into truly legislative bodies—that is into the international parliament. As to the judicial branch of the future world organization it is enough to say that he is the leading living advocate of the establishment of a permanent world court founded on the model of the United States Supreme Court. And in the committee of diplomats charged by the Second Hague Conference with the task of collecting the various proposals to be submitted to the Third Conference about 1915, he almost sees the germs of the international executive. The significance of all this is realized when it is remembered that Professor Scott has not only come to these conclusions as a student of international law, but as a practical diplomat and statesman. His belief in the "Americanization of the World" is, of course, not a new idea. THE INDEPENDENT and others have frequently pointed it out these past ten years. But for a member of the Hague Conference, the technical adviser of the President of the United States and the Secretary of State, to hold such progressive opinions proves that the truth is being perceived in high places and the world is moving.

We have no space to comment extensively on Professor Scott's discussion of the work and significance of the two conferences. His exposition of them is exhaustive and authoritative. He has ever brought to light many new facts, hitherto unknown to the general public. In no matter of essential importance do we think him in error. Still we venture to point out a few trifling sins of commission and omission. While repeatedly praising Mr. Holls for the great work he did in the First Hague Conference, Pro-

fessor Scott leaves the impression by quoting from Dr. Zorn (page 75) that Mr. Holls did not deserve the credit of making Germany reverse her opposition to the Hague Court in the dark days at the First Conference when he was sent to Berlin for the purpose by Andrew D. White. Before he died Mr. Holls told the present reviewer the part he played in that memorable mission. When Mr. Holls arrived at the foreign office at Berlin and had presented his strong letter from Dr. White, he was shown a memorandum in regard to the hypothetical Hague Court that had been referred to the Kaiser and across which the Kaiser had written in his imperial hand the short and ugly word "*Nein.*" Then Mr. Holls recalled to the foreign office the promise that had been given him on his previous visit to Berlin, namely that Germany would not oppose any court proposition provided that England and the United States could jointly agree upon one, and he added, "Of course Germany can change her mind and repudiate the pledge to the United States she made thru me, but if Germany does so she must give her reasons to the world publicly and from the floor of the conference. If Germany opposes the creation of the court secretly and indirectly the United States will consider it an unfriendly act." When this statement was taken to the Emperor, all opposition to the court on the part of Germany ceased. It showed perhaps undue "nerve," but it worked.

Professor Scott also gives Sir Julian Pauncefote the credit of being the father of the idea of the Hague Court. No doubt Sir Julian deserves unstinted praise for his initiative in connection with that great result of the First Conference. Still this leaves out of account the work of the American delegation which was centered in Mr. Holls, who undoubtedly got his inspiration from the famous resolution of the New York State Bar Association in the nineties calling on the President of the United States to convocate a Congress of Nations to constitute an international court.

Professor Scott also handles with gloves Captain Mahan, of our delegation, who generally took the unprogressive stand whenever opportunity offered at the First Conference, while he contents

himself with saying nothing evil of the British delegation at the Second Conference when their fellow countryman, William T. Stead, characterized as "the greatest set of incompetents who ever achieved an unmitigated failure." Professor Scott also fails to give Triana, of Colombia; any mention when he speaks of the eminent South American delegates, and he ranks Señor Barbosa's lofty address on "The Equality of Sovereign States," which we published in THE INDEPENDENT of January 9, 1908, and called the "most notable single effort emanating from the conference," below Renault's technical debate on "Compulsory Arbitration," which in cold type at least does not seem especially noteworthy.

On page 316 Professor Scott justifies the decision of the Hague Court in the Venezuela case for awarding preferential payment to the blockading Powers "if Venezuela consented to the preferential treatment." The "if" saves his face. Still the professor must know that Venezuela never granted any preferential treatment to the blockading or any other Powers as the credentials and letters of the American Minister at Venezuela and his subsequent protest against the award clearly show.

Professor Scott also fails (page 348) to explain fully why the United States delegation took no part in the early discussion of compulsory arbitration at the Second Conference. If rumor can be credited, the real reason was that the delegation was estopped by the authorities at Washington, and it was only after the cables were brought into play that the President could be persuaded to reverse himself and let the delegation go ahead. But then it was too late, Germany had won the day and compulsory arbitration was lost, all except the abstract principle and what was contained in the Porter proposition.

In speaking of "The Federation of the World" which is already in existence by the fact of the Hague Court and the recurring Hague Conferences just as the American States were already federated when the Continental Court was provided for and the Articles of Confederation were signed, Professor Scott says:

"We shall undoubtedly create various insti-

tutions to satisfy our international needs, and if the federation of the world be an international need, no doubt it will come. As yet the unaided vision fails to discover it."

This from the man who has pointed out as no one else the striking analogy between the forty-four United States and the forty-four United Nations.

These are about all the criticisms we can find to make in the volumes before us. Their virtues cannot be compressed in a book review. Every library should purchase them, all progressive clergymen and educators, and certainly all peace workers should read them, and last but not least those diplomats and journalists and others who seem to be congenitally incapacitated from appreciating the peace movement should be compelled by law to read them for half an hour after each meal.

H. H.

The Garden Yard

The Garden Yard,* in spite of being a book of decided value, has an amateur flavor. The introduction by Mr. Nelson expresses very compactly and urgently his ideas of association and coöperation. He is undoubtedly right, and we shall all come to see it by and by. He describes the work of Mr. Hall, our author, as boiled-down experience; but when he tells us that a cobbler or clerk or typographer can take this book, and with his tennis-made muscle and his trade accuracy, "can make a bare living on the land the first year, a good living the second year, and start a bank account the third year," we doubt it. The writer of these notes has gone thru this mill, and has learned the lesson of patience. It will not do to urge people out of the city onto the land with any such expectation as getting a bank account by the third year. It needs a whole lot of other things besides muscle and ability to keep accounts, and it needs a good deal more than capital and zeal and energy. Every spot on Mother Earth is different from every other locality, and the man who puts his faith in this mother has got to learn what to plant, as well as how to plant it. We recognize the fact that they will do a

*THE GARDEN YARD. A Handbook of Intensive Farming. By BERNARD HALL. With an Introduction by N. O. NELSON, and a Revision by H. W. C. LONG. Wash. of Rural New Yorker. Philadelphia: David McKay. \$1.00.

great deal better if they have Mr. Nelson's advice and Mr. Hall's book. Unquestionably also they will do well to take up Mr. Nelson's proposition, with which our readers are familiar: he will furnish the money to pay for all the land that a city colony will need, and let them begin paying the cost price of it at the end of five years, and finish in ten, with four per cent. interest. He only requires that they shall have the agreed number, and are able to provide the working equipment for making improvements. He adds, however, that he has run across a good many empty-handed folk, whose instincts are dependent on other people. These people should hire out until they learn farm work and life, and then establish themselves later on property of their own. His idea of moving to the country in colonies is well considered. It needs a good deal of character as well as cash to make a good farmer.

However, Mr. Hall's enthusiasm is all right, and such books as his do a good deal to help the honest and sensible home builder, whether in a colony or alone. He is evidently learning himself a great deal more about the country than when he published his first book. That he has more to learn he will be the first one to acknowledge. On page 71 and elsewhere he speaks of humus as something that we add to the soil, but on the next page he tells us that we cannot re-soil the earth or any part of it. "It was here before us, and will remain after we are gone. All we can do is to put back into the soil some of the vegetable matter of which we have robbed it." On the contrary, a good farmer makes new soil all the time, of course in conjunction with legumes. One might fairly change the name of agriculture to "air-culture" on this account. We can and we do take the elements of the air and transform them into soil. However, we imagine that Mr. Hall is no more than careless in his statements, for he tells us how, by means of clover, cow peas, etc., to furnish humus, which is incipient soil.

However, take this book thru and thru, and you will be surprised to find how little there is to criticise, especially when you consider what an infinite number of topics are discussed. He under-

takes to cover the whole subject, and lead the country home maker from the word go until the house is built, the gardens planted, the trees grown and the bank deposit sure and large.

Fraternity. By John Galsworthy. New York: G. P. Putnam's Sons. \$1.50.

"His unmannerized manner was quiet to the point of extinction": the characterization of Mr. Galsworthy's hero in his new novel, *Fraternity*, gives the reader a sure prevision of Hilary Dallison's probable action, or inaction, anything except reaction to the stimuli of life in any given set of circumstances. Can we call Hilary a "hero," or shall we be obliged to invent a term, for this new sort of character around which the novel crystallizes, imprisoning in its clear amber an amorphous, invertebrate atom? May we even call him a "character" who has none? Just a loosely-bound bundle of tastes and distastes of which the latter is far the more intense! His ancestors, who had been men of action all their lives, had not perceived that:

"it would grow to be a matter of common instinct that to act was to commit one's self, and that, while what one had was not precisely what one wanted, what one had not (if one had it) would be as bad."

The strongest impression left upon the mind is that of futility, the atrophy of the nerve of action in those who think, and the lack of reason in those who act. But London lies all about one as the story flows on, the confused sound of its inarticulate muttering, the unquiet beating of its monster heart. It lies about the little group of people who belong to the artistic, literary, *fin de siècle* circle, and it makes them vaguely unhappy. All of them feel its unrest; Hilary, the writer. Bianca, the artist; the highly respectable solicitor and his very conventional wife; their exquisite young daughter and her cousin, Dr. Martin, "the Young Sanitist" his uncle calls him, who in the dearth of any other religion has invented himself one, that of Health; the odd, half-mad father, who had been a great scientist in his day, and is writing a book on "Universal Brotherhood." A strange book, in which he speaks of our own time as "in those days, when men were living on their pasts." The impression of the

novel, however, is that "in those days" men were living on nothing. It is like seeing animals tortured in a vacuum, there is nothing to breathe in; men have no religion, no hope, no real sympathy, no vital faith in anything, not even in themselves. There is a strange and wonderfully written chapter in which Bianca goes to her fantastic father, for help, in a crisis of her life, and he can only babble excerpts from his book, and feel vaguely uneasy that his daughter is unhappy. He has forgotten the language of sympathy, if he had ever known it in his pedantic youth. A scientist can be a pedant as thoroly as any humanist can. Mr. Stone may be mad, but the world he tries to picture is less sane than he.

Letters, Lectures and Addresses of Charles Edward Gorman. A Memorial Volume. Prepared with the Co-operation of the Class of 1884, Amherst College, by Eliza Minor Gorman. 8vo, pp. xiii, 616. Boston: The Houghton-Mifflin Co. \$3.00.

Few American teachers have had the influence on their pupils of Professor Gorman, who held the chair of philosophy at Amherst College. Shortly before his death his pupils, now themselves teachers in philosophy, issued a volume of essays in memory of him. Now they have secured the publication of a volume of his addresses, lectures, etc., for he published almost nothing during his life and his lectures were not prepared for the public eye. These collected papers are wonderfully interesting and stimulating, but we are not compelled to accept the spiritualistic monism which he taught his classes, and which is a popular device for maintaining faith in God, or, at least, relationship to him. But we do not need here to discuss Professor Gorman's philosophy, and are concerned with the man as a teacher. It is the evidence of his power that at the present time there are more active teachers of philosophy who have come from his classes than have come from any other institution in the country. He made the study seem like the study of life, something of profound importance. He seemed almost indifferent to the doubts and questions he first started in his students' minds, for all he wanted was to teach them to think for themselves, to weigh evidence, to challenge all faith,

that he might bring them at last to the sure foundations of rational knowledge of truth and God. These miscellaneous papers touch on various subjects, philosophical, practical and social, followed by educational discussions and admirable addresses to his successive classes. One is delighted at the aptness and abundance of the illustrations which lighten the discussions. We warmly commend the volume to the study of others besides the hundreds who were Professor Gorman's pupils. An odd misprint of "vaccinate" for *vaticinate* appears in the first line of page 64.

The Glory of the Conquered. By Susan Glaspell. New York: Frederick A. Stokes Co. \$1.50.

There is much that is morbid in Miss Glaspell's first novel, *The Glory of the Conquered*, and something that is fine. The book is built about Mercie's statue, Gloria Victis; it is the story of a noble love, and of a great renunciation. It is good for the soul. Because it tells the truth about happy marriages for one thing, and that requires the courage and audacity of youth! Happy marriages do not happen, they are the product of several things beside the strong attraction which is their initial impulse; good sense, mutual respect, generous interpretations of each other's acts and a saving sense of humor. The last requirement is not insisted upon as much as it should be; and Miss Glaspell falls into the fault of an almost hysteric intensity in working up the great catastrophe of her married lovers' life together. People of their type bear troubles together, but they do not talk about them so much. Nature has its fine reserves, and it is unfortunate that art falls so easily into the garrulity of trying to tell everything. The great artists know how to tell a story better by only telling half of it, and Miss Glaspell may learn that self-restraint is stronger than importunate expression, of feeling. The scene of the novel is Chicago University; its hero, a bacteriologist seeking the cancer germ; its heroine, the artist wife of the scientist. The story of their love is better than merely beautiful—because it is not unique. It recalls Professor and Madame Curie, Elizabeth and Robert Browning and a thousand

others. It is a fine quality of the book, too, that there is in it a genuine enthusiasm for vital investigation and a real appreciation of the consecration of the scientist to his work. Soldiers of truth who lay down their lives as bravely and more deliberately than have the armies of patriots; each slain for an idea—one of political freedom, the other of service to the race, and it is the essence of the service which the biologist seeks to render to his fellow men that his discoveries will for others make life worth while. Dr. Karl Hubers is one of the noble army of martyrs, who have served biological science with self-forgetful heroism in seeking the mystery and remedy of a malignant disease. It does not matter in the least whether the author's diagnosis of cancer is medically correct or not, but it does matter that she has caught the spirit of a man who loved his kind supremely, and of a woman who loved her husband so well that she gave up her life-work to share his. It is the task of investigators in laboratories like that of the Rockefeller Institute to make the future sacrifice of such men as Dr. Hubers unnecessary, by using guinea pigs instead; but the world ought to honor those who have fallen in the brave fight. Why should the sentimentalist prefer the loss of a trained scientist and a noble man, to the use of a few animals bred for investigation? It may be a careful reading of *The Glory of the Conquered* will give the anti-vivisectionists a better subject for a sympathy more rational and not less tender-hearted. For compassionate men will ever be moved by the sufferings of human beings, to find a remedy tho they die to discover it.

Johannes Brahms: The Herzogenberg Correspondence. Edited by Max Kalbeck. Translated by Hannah Bryant. New York: E. P. Dutton & Co. \$3.00.

This first instalment of the Brahms correspondence published by the Brahms Society in Germany contains 281 letters that passed in the course of twenty-one years between the eminent composer and his ardent admirers. Heinrich and Elizabeth Herzogenberg, whose sympathetic friendship he valued highly, tho he was prone to twit them humorously on their fervent discipleship. The husband was himself a composer of considerable abil-

ity, and the letters are largely concerned with the compositions of the two men, Brahms often showing these friends his new works before publication. Of the total number, only 141 of the letters in the volume were written by Brahms. They seldom tell much about his musical feelings or sympathies, but they do give glimpses of the sane, healthy, normal, sincere and rugged man that was Johannes Brahms—usually a plodding, albeit a scholarly, worker, and on certain occasions (not so frequent as the music-loving world could wish) the bearer of the divine fire from Heaven. The personal and musical allusions with which the letters teem are all carefully explained in footnotes by the editor; but, as in most personal letters, there is much in these that was transient and now is of no interest to readers for whose eyes the letters were never meant.

Walt Whitman. By George Rice Carpenter (English Men of Letters.) New York: The Macmillan Co. 75 cents.

While Professor Carpenter's untimely death invests this last book of his with an interest more or less independent of its contents, it is still sufficiently remarkable in itself as the clearest, plainest, and least vexatious account of Walt Whitman in print. In contrast with Mr. Perry, in whose recent life of the poet the sense of something problematic and perplexing was very strong at times, Professor Carpenter seems to have found comparatively little that is puzzling or disconcerting in his author. This result is due in part to Professor Carpenter's manner of treatment in which speculation is strictly subordinated to biography; but it is also due quite as much to the directness of his mind. Even his analysis of Whitman's poetic quality, the most elaborate and ingenious bit of criticism in the volume, is conspicuous for the same unexpected simplicity. From the point of view of versification he explains Whitman's poetry as a kind of extension and development of direct personal address, prompted by the speaking associations of tongue and ear rather than the more literary ones of eye and hand—in short, his verse is nothing more or less than "living, musical, rhythmical, impassioned speech." As for the poet's "message" that is to be

accounted for by his consistent fidelity to the popular mind, from which, unlike so many other poets of similar extraction, he never apostatized; while his form in its higher signification is finally determined by the further circumstance that "his poetry of democracy sprang not from well defined concepts," but was "in large part the product of that extraordinary mental condition which we associate with the mystic."

Literary Notes

Christianism and Freies Denken, by Anton Nystrom (Berlin: Oesterheld & Co.) is sufficiently characterized by its title, the chief purpose being to adapt the teachings of Christianity to independent thought. It is called a "critico-historical" work, of 550 pages, with 65 illustrations, fifteen of them full paged.

....The Rev. Sumner Gilbert Wood, of Blandford, Mass., reveals himself as an industrious local historian and antiquarian in *The Taverns and Turnpikes of Blandford, 1733-1833* (Blandford, Mass.: Published by the Author, \$2). While strictly a local history, the book has a wider interest, since it portrays an aspect of the life of a past period to which specialists in our social history have for some time been devoting considerable interest. Blandford was settled by "Scotch-Irish," on the main highway from Boston to Albany, a much-frequented turnpike, whose traffic made the tavern and its keeper institutions of importance. Records and traditions are drawn upon freely, the author succeeding in drawing from the many details he gives a general impression of the life of our forefathers as it centered around the tavern.

....Mr. Archibald Forder's *Ventures Among the Arabs* (Gospel Publishing House, N. Y. \$1.) is a stirring narrative, yet told with becoming modesty, of many perils, and of almost miraculous escapes. For the first time we see a picture of the Tomb of Aaron, on Mount Hor, which Mr. Forder believes to be absolutely authentic. He had considerable difficulty in visiting this tomb, carefully guarded as it was by the Arabs, and he claims that no Christian had ever been allowed to approach it before him. He secured a photograph of this tomb, which is on the mount some eight days' journey from Jerusalem in Arabia Petrea. The tomb itself is an oblong structure covered with Arabic inscriptions, and is certainly most interesting to know about. Whether it is actually the tomb of Aaron may, however, be a matter of considerable controversy, for it was many generations after his death before the Arabs were sufficiently interested to guard this place. Possibly it is as authentic as the Tomb of Rachel, which is shown, but has never been investigated. It seems a pity that quarrels among Christian sects should have opposed Mr. Forder to return from a land in which he had so well demonstrated his usefulness. But he was

not discouraged and continued his work of spreading the Gospel independently, traveling many hundred miles, with little money, and a large store of hope and courage.

Pebbles

SENATOR ALDRICH favors putting the Ultimate Consumer's hide on the free list.—*Chicago Evening Post*.

IT is very strange that President Taft has not been invited by the Wright brothers to take a trip in their aeroplane.—*The Atlanta Constitution*.

THE *Atchison Globe* wants to stop the present row in Kansas. The present row suits us as well as the one that would inevitably follow.—*Topeka Capital*.

WHAT a hit Theodore Roosevelt could make now by getting the sleeping sickness in Africa (not too bad), and, after a period of worry and bulletins, completely recover.—*Atchison Globe*.

"PARDON me," said the gallant gentleman who was making rapid progress in his acquaintance with the beautiful girl, "but are you one of these young ladies who expect every man they meet to propose to them?"

"Oh, no, indeed," she replied quickly. "I think it is much nicer if the proposal always comes as sort of a surprise."—*Judge*.

It was last summer, at Chautauqua. Mr. Bryan was billed to deliver his lecture on "The Prince of Peace," which, as is evident from its title, is a semi-religious and highly moral exhortation. Doubtless the chairman knew this, but doubtless also he was not without worldly knowledge as well, for he wound up his presentation of the lectures with "It is now our pleasure to introduce William Jennings Bryan, who will give you his celebrated address upon 'The Prince of Peace.'" *Spare Moments*.

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - New York

A WEEKLY MAGAZINE. FOUNDED IN 1848.

One Year, \$2.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, \$1.75 a year extra; to Canada, \$1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with \$1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

Killing Never Kills

THAT killing never kills is a lesson hard to learn; it probably never will be learned. It has been tried since earliest history, and today the men who sway the world are those whose lives were shortened in the flesh by their neighbors. Socrates's philosophy is little read or understood, but Socrates drinking hemlock is the schoolboy's oration, in nations born a thousand years after his body returned to earth. Savonarola would have been of little weight in the reforms of the world had he not been killed to get rid of him; and John Calvin has no more vital foe today than Servetus, whom he thought to put entirely out of the way in the flames that consumed him. Such men live because they are made conspicuous by killing.

Beside there is in Nature a certain sort of compensation for a wicked taking off. A recent book asks, "Why we love Lincoln?" With all the other reasons it does not give as supremest the fact that Lincoln died for the people. A good reader of history understands that it is not what Lincoln did that makes him dear to us, but what he suf-

fered. Had he lived to press the reconstruction measures that he had conceived he would have lost a good deal of popular esteem. When he was killed, every one to the end of time was forbidden to see his faults or recall his failures.

It is not probable that Jesus would have won the world by any other road than death. It is his cross that has become, among a hundred nations, a sign of human unity and the ever-longed-for "On earth peace; good will to men." The young Jew who, in life's prime, taught reform, belonged to Judea. He was a competitor of Hillel and Gamaliel; but when the Romans joined with the high priests to sacrifice him for his teaching, he began to draw the eyes of a hungry humanity, and wonderfully well has he been able to teach to the ends of the earth.

Life, after all, is not very well understood by us, while the value of death is totally misunderstood. Life without power to die would promptly run us rapidly into hopeless degeneracy. To hug our years may sometimes be wisdom, and long life, if well lived, is certainly a blessing; but life merely as life has little value. We shall have to recur to our poet, and make sure that we live in deeds, not in years. Dr. Osler's deduction that life after forty is valueless should read that life before forty may become immortalized in the life of humanity, and that to live a tame century is hardly worth the while.

A Decision on Genesis

THE Holy Father has provided for the establishment at Rome of a special college for the study of Holy Scripture, and has promised that it shall be of the highest scholarly character. We do not doubt that it will find abundant field for its studies, but they will not be free; they must be limited to those subjects which the Church for the time allows. Some things not allowed are indicated in the decision of the Papal Biblical Commission, approved and decreed on June 30, on the proper interpretation of the three first chapters of Genesis. We translate below from the Latin text the important portions of this surprising, if not astounding, Papal decree which is from this

time binding on the entire Catholic Church in all its schools of science and theology.

The decisions are put in the form of authoritative answers to questions whether it is allowed to hold and teach this or that view or interpretation. We give the three first questions and answers in full:

1. *Whether the various systems of exegesis which have been devised and defended with a show of science, for the purpose of excluding the literal, historical sense of the three first chapters of Genesis, rest on any solid foundation.* Answer, *No.*

2. *Whether, notwithstanding the character and historical form of the Book of Genesis, the special connection of the three first chapters within on another and with those that follow, the repeated testimony of the Scriptures, both of the Old and the New Testament, the almost unanimous agreement of the Holy Fathers, and the traditional sense which, handed down by the Hebrew people, the Church has always held, it can be taught that these three chapters of Genesis do not contain accounts of things actually done, which correspond to objective reality and historical truth; but which are either fabulous and drawn from the mythologies and cosmogonies of ancient peoples, and have been purged by the sacred author of any error of polytheism and accommodated to the doctrine of monotheism; or are allegories and symbols, destitute of the foundation of objective reality, and under the guise of history have been put forward for the purpose of inculcating religious and philosophical truths; or are legends, in part historical and in part fictitious, freely composed for the instruction and edification of souls.* Answer, *No, in every point.*

3. *Whether, in particular, the literal, historical truth can be called in question, when one is treating of the events narrated in these chapters, which have to do with the foundations of the Christian religion, such as, among others, the creation by God of all things in the beginning of time, the special creation of man; the formation of the first woman from the first man; the unity of the human race; the original bliss of our first parents in a state of righteousness, purity and immortality; the command given by God to man to test his obedience; their disobedience of the divine command, persuaded by the Devil under the form of a serpent; the fall of our first parents from their state of primeval innocence; and also the promise of a more glorious life.*

Five other questions follow, the purpose of which is to show the limits to which permission is given. In the interpretation of passages on which Fathers and Doctors have differed, without detriment to the aforesaid decisions, one is allowed to adopt an opinion which has been prudently approved by them; it is

also not required to interpret every word literally when it is evident on the face of it that it is used metaphorically or anthropomorphically. It is allowed, besides the literal sense, to add an allegoric or prophetic sense; exegetes are not required to interpret language in an exact and scientific way which is employed in a popular sense; and they are allowed freely to dispute whether in the account of the six days of creation the word *yôm*, *day*, means a natural day or a period of time.

Think what this means. The only liberty given to teachers is to teach that the six days are six periods, geologic ages. That is all. The rest is literal. The physical body of Adam was made of dust, and the animals were brought before him and named, and when he found no suitable companion he was put into a deep sleep and a rib was taken out and Eve made therefrom; there were two trees in the garden, one the tree of life, eating which would confer immortality, and the other the tree of the knowledge of good and evil, and the Devil, in the form of a serpent, persuaded Eve to eat the forbidden fruit, and they were thereupon cast out of the Garden, with a curse and a promise. All this Catholics are told they must believe as literal, historical truth, not myth, not parable, not poetry, not fable or tradition expurgated and purified for religious instruction, but literal naked fact; and if any criticism, history or science, assumes to deny it, such teaching is absolutely forbidden. It is amazing that in this late day there should be such perversity of blindness in the Roman hierarchy. It must come as a blow between the eyes to the biologists and anthropologists of the Church. We doubt if there is a scientific man living who believes all that to be literal fact.

The chief vice of it all is in the presumption to tell scholars and people what they must and must not believe in these things. It is worse than the Athanasian Creed, for that was in reference to matters that are beyond human ken; but these matters come within the realm of human science on which an adverse judgment can be framed. Science can contradict the Church, and when science and sense contradict the Church it is the latter that always must fall. It is a sad

sight to see the Church thus put itself wrong and drive away its children. Our youth learn, and must learn, in the schools they go to, that this teaching of the Church is not true. The Church ought not to make it hard to stay in it; it should give latitude and hospitality and encouragement to its children. It must fight wrong and must teach God and His love in Jesus Christ, but it makes a terrible mistake if it forbids men with as devoted a search for truth as its own to seek if peradventure they may find truth, which is itself the glowing garment of God.

It is incredible that scientific men in the Catholic Church can really on compulsion and by ecclesiastical dictation believe what they are thus told to believe. It is hard to think that they will cease to teach what they believe. What will they do? We trust they will not leave the Church in which they have been baptized, but that they will wait till the storm be overpast. Meanwhile we recall what Des Cartes said under similar inhibition.

It was thus Des Cartes, thirty years after the condemnation of Copernican astronomy, protected himself when he wished to expound the forbidden view:

"There can be no doubt that the world was created in the beginning in all its totality, and that the sun, earth, moon and stars originated at that time, and that Adam and Eve were not born as little children, but as grown people. Thus teaches the Christian faith, and our intelligence easily convinces us of the fact. Nevertheless, it is more expedient, when we wish to understand the nature of plants and of men, to cogitate how they may gradually have developed from seeds, than to consider them such as they came forth from the hand of the Creator. If we should be able to imagine some very simple and easily intelligible principles, by whose aid we could prove that the stars, the earth, and everything we perceive in this universe could possibly have arisen from seeds, we shall much better understand them than if we described them merely as they are now, altho we really know that they have arisen in the manner just indicated. Since I now think I have arrived at such principles, I will briefly expound them here."

The Pole at Last

THREE cheers for the American Cook, three for the American Peary, and then three more for the British Shackleton, who almost reached the South Pole. It is glory enough for the race, and yet other races could have done as well if

they had had the opportunity and the fortune. We give similar honor to both who have achieved the Northern Pole, for both had struggled long for it, but perhaps most to Commander Peary, who has struggled the longer, and with the larger scientific equipment. Brave men both; brave men all three, and an honor not merely to their breed of men, which we call Anglo-Saxon, but to humanity!

It has been one of the noblest, most useless of quests. There is nothing to it worth while that is material when found. The Pole cannot even hold the flag—it floats away. The glory is all in the men, their courage, their persistence. We want no spot of the earth unconquered. Now we have conquered the last great appeal of nature, and when we have it is of no use to us. Is it then a disappointment? Are there other worlds to conquer? In a year or two shall we have summer vacation trips to the pole by airship, as we now go to Nova Scotia, not for use, only for pleasure and excitement?

We are all of us elated at the discovery of the North Pole. We all rejoice that Americans did it. We congratulate Cook and Peary on their triumph. No ship was wrecked; no lives were lost; nothing to detract from our satisfaction, yet every one of us probably could detect at the bottom of his heart a slight feeling of disappointment. If nothing more there is the disappointment at not being disappointed, as we have been so often before. We have been all our lives used to longing for the discovery of the Pole. There is something felt to be wanting now we have no longer this ungratified ambition. It was an ambition that we all shared to a certain extent, collectively and individually. Even those of us who were least stirred by the spirit of adventure and were most disposed to begrudge the money and effort expended for this purpose, still felt a secret hurt to our pride of manhood that there was this unattainable spot upon the globe. We could not tell why anybody should want to go there, but we were irritated because he could not. Tibet is an uninviting country, no inhabited territory is less desirable, but because it was called the Forbidden Land brave men of many nations have striven and suffered to enter it. The North Pole has always loomed larger in

our ambitions than the South, tho from a theoretical standpoint they are of equal interest, and it is only from a theoretical standpoint that they have any interest at all. The reason for this preference is because we civilized people are Northerners. It may be doubted whether the Australians and South Africans take as much interest in Antarctic as they do in Arctic exploration, for two or three generations of southern residence have not in other matters been sufficient to effect a transfer of their mental emotional center of gravity to the southern hemisphere. The North Pole was the more valuable to us simply because it had been more sought.

It was, we realized, merely a goal post that man has set up for the converging ambitions of all nations; a fictitious aim like any game, a prize as valueless as a crown of wild olive. It was sought in the name of science, yet scientific men took less interest in the struggle for it than the masses.

"If I had Truth in one hand and the Search for Truth in the other, I would set free Truth that man might ever pursue it." This is quoted more often than it is applicable, for the discovery of Truth usually opens the way to a wider Search and also confers practical benefits not to be despised. But in such a case as this it has a real meaning. One of our popular novelists has told of an explorer who upon his deathbed destroyed all the evidence of his discovery of the Pole because he felt that it would be wrong to rob the human race of this inspiration of heroic endeavor, one of the few ideals of a materialistic generation.

Then, too, Shackleton, Cook and Peary have within the last six months taken away our only playgrounds. There is no spot on the whole round earth where men may exercise their imaginations. They will have to go to Mars for it, but that is too far off toward the suburbs of the solar system to be convenient. Those of us who in youth had pored over "The Strange Manuscript Found in a Copper Cylinder," either as a lesson in the impracticability of absolute altruism or as a mere adventure story, could not help a throb of disappointment when Lieutenant Shackleton came back from the Antarctic and never said a word about that mys-

terious race which loved darkness rather than light because they were entirely un-
~~solid~~. And now we have Cook and Peary from the Arctic with equally bad tidings. They have nothing to say of the Garden of the Hesperides which Apollodorus placed there. They have found no evidence of the Garden of Eden, which since its removal from the valley of the Euphrates has been supposed to be there. It seems, too, that the French astronomer, Bailly, was mistaken in supposing that Plato's lost Atlantis was at the Pole. In short, the World's Lost Articles Department is found empty and bare.

Dr. Cook says the North Pole is a flat field of ice. Where then is the volcano into whose crater the indomitable Captain Hatteras plunged? Must we give up our Verne? Still more disappointing to us is the loss of Captain Symmes's hole, one of the most brilliant and original scientific theories that America has yet produced. If this hole has in some way got stopped up there is no way by which we can ever discover the two interior planets, Pluto and Proserpina, or reach the delectable realm of the "Goddess of Atvatabar." Dr. Cook does not seem to have taken advantage of his unique opportunity to try that interesting experiment of walking around the Pole from West to East and so traveling the road to yesterday by which he could reach any desired period of the past.

Even those of us who had ostensibly repudiated all fairy stories, could not avoid feeling that the Pole was somehow different from common earth or ice. Perhaps it was the persistence of a visual image acquired in youth of the world as a ~~rough-surfaced~~ globe with a real hemisphere as an axis. Perhaps we had so far refined our conception as to see it like a telephone central with 360 wires all coming together at the top. One of the reasons given by the London journals for their skepticism of Dr. Cook is their disappointment that he did not report his achievement in a ~~different~~ style. The *Daily Mail* says: "The whole business of his amazing march at breathless speed for Arctic travel across vast distances of ice to a point never before reached by man is treated as if it were the story of a man walking across a field to a hay-

stack." Does not the *Mail* know that the professions of hero and bard were long ago differentiated, that it is not now regarded as good form for a man to be his own press-agent? We demand of Dr. Cook how the North Pole looked. He tells us it looked "like a silver twenty-five cent piece." We want to know his sensations when he stood alone on the top of the earth. He tells that he felt cold. We ask him in what exalted language he proclaimed his triumph. He tells that he shouted, "Bully for you, Frederick!" Is not this the best of evidence that he is giving us the plain facts? This skepticism also has its rise in disappointment. It was a great feat but he did it when we were not looking. Dr. Cook did not have so much money to spend, he did not have so big a party, he did not make so much fuss in advance about what he was going to do as his predecessors, but that is no reason for assuming that he did not succeed where they failed. Still even he confesses to a feeling of disappointment, discouragement and disillusion as he left the spot. Probably when Commander Peary gives us his story it will show something of the same emotion.

Our Symposium on Prohibition

IN our issue of July 22 we referred to our readers the question, "Does Prohibition Prohibit?" and we published impartially the answers received and left our readers to decide how the balance turned. To our mind the most conclusive point was that the brewers and distillers are frightened and fight the movement with all their power. They would not do it if it were not greatly reducing their sales and profits. Among the many letters since received the most important were those which contradict the reports we published as to the beautiful moral condition of Milwaukee with its open saloons, and as to the failure to enforce the law in Kansas City, Kan. We judge that in both these cases the reports published by us July 22 would need serious correction.

We have been much amused at the way our symposium has been treated by *The Brewer and Maltster*, the organ of the business. In an editorial it tells its intelligent readers that the Catholic

Church and the Congregational Church are the only two that have an "organ," and that *The Independent* is the organ of the latter Church, that these two Churches are substantially against prohibition, that *THE INDEPENDENT* distinctly shows that "prohibition does not prohibit, and that the course of these so-called reformers is to make two drunkards where one existed before." Every one of these statements is untrue. Our concluding statement was:

"The saloon business is being made more disreputable, and the brewers and distillers less admired members of society. . . . If they suffer from hostile legislation they have no right to complain, they know the nature of their business, and no public spirit or private generosity on their part can purchase them the privilege to do a public injury and a multitude of private wrongs."

As to the Congregational Church, at its last National Council, it took strong action against the liquor traffic, from which we quote but a single sentence:

"We recognize with gratitude the efficient work of the Anti-Saloon League and commend its support as a most valuable agency for the prosecution of restrictive work and suppressive work."

That is plain enough.

We may add that *The Brewer and Maltster* quoted verbatim every letter which appeared in our symposium opposing prohibition, and not one word in its favor. But what else could be expected?

Culture

PRESIDENT HADLEY'S definition of culture is exprest antithetically. He says in a long article in *The New York Times*:

"I should say that culture was the opposite of absorption in the obvious. The obvious is that which gets in our way, the thing we cannot help seeing in its full size. The cultivated man or woman is the one who is able to cut across fields of life, material and social, literary and political, values in proper proportion the things that are unseen, or at best very imperfectly seen, by the less trained vision."

This is one of many definitions that can be defended, if not as "obvious" as those in the dictionaries. It would seem to make culture almost identical with judgment, but President Hadley makes judgment the intellectual side of culture, as taste is of the esthetic side. It can be argued that taste is the faculty, or power, to value in due proportion what, to those

not possessed of it is unseen or imperfectly seen, but this is itself less obvious.

What is less obvious is what is less publicly seen and known; and this fact takes us back to the usual definition of culture which makes it depend on wide general knowledge. We quote dictionaries at hand: "Enlightenment and discipline acquired by mental and moral training"; "refinement and enlightenment, learning and taste"; "the acquainting ourselves with the best that has been known and said in the world" (Matthew Arnold); "thoro acquaintance with all the old and new results of intellectual activity in all departments of knowledge, so far as they conduce to welfare, to correct living and to rational conduct" (W. K. Brooks). This comes to the same thing in the end as President Hadley's definition, for the man who by "enlightenment," "learning," "acquainting oneself with the best," and "thoro acquaintance" "in all departments of knowledge," has acquired culture will not fail to see beyond the obvious, and will put its true value on what obtrudes itself and which may or may not have worth.

President Hadley does well to include both judgment and taste under the broad term of culture. A man may have great learning and be able to see what is behind the obvious in science or politics and yet be an uncultivated boor. He is not likely to be, but he may be. A man may have the manners and taste of Chesterfield or Ward McAllister and yet be ignorant of true culture. The two must be combined, the learning of books and the graces of society for complete culture.

Learning, acquired only by long and painful study, is not culture; it is the means of culture. It supplies the reservoir of knowledge in which the cultivated man instantly fishes for pertinent facts whenever any topic is presented. What characterizes him is his power of suggestion. He has a thousand lines out which he can draw in as he pleases. Or, to change the figure, he has the power of stereoscopic vision. He sees both sides of a thing and not merely its flat front surface. He knows how much solidity there is to it. He is not deceived by the "obvious" face of things.

A five-foot shelf of books properly

chosen might give an immense amount of information, and supply much material for culture; but oh! they would require an immense amount of intense study. Mere reading would not be enough. And the attrition of culture comes thru long labor and experience. Few acquire it. Not the merry suitors of Penelope, but only Ulysses could draw the brazen bow. Agamemnon did not ask for ten like Ajax, but if he had ten like wise Nestor, who had seen three generations of men, he could capture Troy. Possibly there is no definition of culture better than that which Milton gave of Education, for the two are inseparable:

"I call, therefore, a complete and generous education, that which fits a man to perform justly, skilfully, and magnanimously, all the offices, both private and public, of peace and war."

Matthew Arnold says that culture is "A study of perfection." Carlyle says that its law is, "Let each one become all that he was created capable of being." Culture is the consummate flower of the widest education, and Addison tells us that "What sculpture is to a block of marble education is to an human soul."

About American Health

THE Committee of One Hundred, appointed by the American Association for the Advancement of Science, is making some researches which bid fair to be of value to the American people. It starts with the proposition, borrowed of Darwin, that we ought to take as much care "in the breeding and training of children as we do in that of our domestic animals." Its platform is a sound one, "That the growth, power and prosperity of the country depend primarily upon the physical welfare of its people, and upon their protection from preventable diseases." It borrows from President Roosevelt the maxim, "The preservation of national vigor should be a matter of patriotism." To this end the organization of national public health agencies into a single department is urged, and it would give to this department the strongest possible control over all interests bearing upon American physical character.

We have been at work on the sanitary conditions of Cuba, and we have seri-

ously determined to increase the stature as well as the morals of our Oriental subjects. The Department of Agriculture spends seven millions annually on plant and animal health, but Congress does almost nothing to promote the physical well-being of human folk. Not a dollar has yet been appropriated for eradicating pneumonia, but thousands for stamping out swine cholera. Beetles are fought with public money, and potato plants are protected against blight, but the conditions that breed disease and sweep out three millions of infants every five years are undisturbed. In fact, we lack an American standard. Our composite nature, made up of a dozen nationalities crudely mingled, has left us with no physical ideal. We cannot compare in physical beauty with the Scandinavian, nor in digestive capacity are we keeping up with immediate forbears. Our intellectual standards are most stable, for we have an American faith in common schools. Yet even our schools break down the nervous system and fail to grasp the old Greek idea of "making men." There is little to criticise in the stuff that constitutes our educational pabulum, yet what pupil conceives that all this material is to be applied to himself, not merely learned?

The problem just ahead is to be, not what nation has the most or biggest warships, or can most rapidly fire the most dangerous projectiles, but which nation has the most virile men and women, with the cleanest bill of health; which nation has the purest blood and the manliest ideas working in co-operation. In the Russo-Japanese war the world soon found out that the little fellows had the best health and the healthiest morals, and that with lithe bodies went manly power of purposing and achieving. American soldiers will compare well, probably, with those of other nations, but the time has past for entrusting our position and our progress to soldiery. What we have got to determine is who has the brainiest and the brawn-iest common people. What nation approaches nearest to an ideal physique, with ideal capacity for pluck and work.

In our mongrel condition as to origin and education, suicides are multiplying. Cowards are born, and we have no sys-

tem of education that will rescue them. Our conception of success is that of accretion, like squirrels and mice. Our business men are disheartened at the loss of a hidden pile. We have lost sight of faith in the great principles of manly determination and right doing. Our religion, even, is largely made up of faith in other worlds and other lives, and despair concerning the life we are now living. The problem of man—that is, the production of an ideal race—we have failed to measure. Our politicians certainly are not at work on any such problem. Appropriations at Washington are not aimed at creating either national health and strength or character.

We believe with the Committee of One Hundred, in their pronunciamiento, that the first great duty of Americans at present is to look after national health and healthfulness. We know that typhoid fever is preventable, but is it prevented? The improvement of our internal waterways is a matter of immediate commercial importance, but it is equally needful to the eradication of malaria. It would drain the marshes and break up the habitats of the mosquito that distributes the poison. Disease, especially those forms of disease which are characteristic of large sections of the country, or of the whole people, are not natural or unavoidable, but are the results of human neglect. Physical degeneration is the result of false conditions. Health is the great truth that is imbedded in right civilization. There is no excuse for a civilized people that can show not more than one sound man in one hundred. Yet this is not far from what we have come to. Nervous exhaustion is characteristic of our population in midlife. Indigestion and its accompaniments characterize the business man. Our daily conversation turns to aches, pains and decay, to a shortage in power that is due to ignorance of the laws of wholeness, or to an irrational use of our knowledge.

What we mean is not to give a lecture on health, but to enforce the need of a well thought out American physical ideal, toward the attainment of which legislation and social effort should steadily press. When we face the certainty of the exhaustion of our main material

revenues by the middle of this century, the question is, Can the American people readjust themselves to new and perhaps pinching conditions, or will we have worn ourselves out in the unreasoning hustle of money getting and waste? Have we got the stuff in us to conquer the wrenching times that are promised not far in the future? It seems not improbable that those races which have learned to apply to daily life the laws of strictest economy will be fittest to survive.

✱

Cherry Blossoms Instead of sending a fleet of warships to the forthcoming Hudson-Fulton Celebration the Japanese present 2,100 Japanese cherry trees as a gift to the City of New York. Do the American people realize the significance of this? The cherry blossom and the chrysanthemum are not only the most beloved flowers of Japan; they have come to typify in a truly poetic sense the very genius and nationality of the Japanese people and mean much more to them than the fleur-de-lis does to France, the thistle to Scotland, or the shamrock to Ireland. It is as if we had some flowery symbol that moved us as the Declaration of Independence, the Constitution and the Flag all rolled into one. Why cannot the American people see that Japan has only the greatest kindness for us. The evidence is overwhelming. And the way she has turned the other cheek to all our recent insults shows that a Christian nation can often learn a lesson in ethics from a so-called pagan one.

✱

Canada's Navy Admiral Beresford pleases the Canadians by telling them that they should have perfect control of the navy they build, but he expects and wishes them to build one, which will be a help to Great Britain in time of war. He also pleased them by saying that if Canada should at any time wish to be independent it would have the right to withdraw, for who would stop them? Britain had her lesson when the United States revolted. But he added that there was not the shadow of a shade of a chance of

their doing so. We agree; and we are glad that the British colonies, Canada, Australia, South Africa, all choose to remain as self-governing kingdoms in the British Empire. Indeed, the larger the combination of United Kingdoms the nearer we come to the Parliament of the Nations. We would like to see the United States and France and Germany and Russia and the rest of the civilized nations all annexed to Great Britain, only it would not then be the British Empire, and the King of England would not be Emperor of the world as he now is of India. However, that is not the way the end is to be reached, but by the development of the Hague Conferences.

✱

"Highway Economics" From the correspondence called out by a recent article on "Highway Economics," we are informed that the case of road-waste was by no means overdrawn by Mr. Powell and is much more complex in the Western States than in the Eastern. It seems that the United States Government enacted a law allowing railroads that were building over Government land to appropriate a strip two hundred feet wide, that being twenty-four acres to the mile. Many railroads were "laid out" before the land was homesteaded, and as a consequence we have scattered about the Western States strips of land twelve rods wide, with a single railroad track running thru the middle. For many miles the grade is not to exceed two feet high, and for a single track two rods, that is thirty-three feet, would be wide enough, and for a double track fifty feet would be all the room needed. When railroads buy right of way they never buy more than one hundred feet; but here, in the generosity of our legislators, about twice that amount is flung at them. It is not altogether a gift to be craved, for every fall the railroads are compelled, at great expense, to plough furrows along the outside of their holdings so that fire from the engines will not be communicated to the adjoining fields of grain. These strips evidently should be farmed, or else put to windbreaks, and in other ways serve the public. This economy of our highways is a subject that will have to be discussed and acted upon.

A Back-Set to Church Federation

It is as well to know the back sets of Church federation. It will be remembered that at the recent Centenary Conference of Missionaries of various denominations in China the Episcopal missionaries took part and the federal principle was adopted by them. But we learn from the *London Church Times*, which represents the extreme "Catholic" wing of the Anglican Church, that at a later conference of the American Episcopal missionaries in the provinces of Shanghai and Hankau a resolution committing the conference to the federation plan was voted down. The writer expresses "a distinct feeling of relief" at this action, which, we judge, represents solely Americans, while at the Centenary Conference the missionaries of the English Church Missionary Society took part, and seem to have outvoted the American representatives. The writer, a Chicago correspondent, thus condemns federation:

"It would involve, if this Church accepted it, a recognition of the ecclesiastical parity of Protestant and Catholic organizations. Many of us felt, with some show of reason, that our own clergy who participated were carried a little away from their bearings by their laudable sympathy with the present cry for unity. Whether our feeling was really justified by the facts or not, we believe that the voting down of the federal principle by our missionaries was as desirable as it is reassuring."

After expressing such satisfaction that federation with Protestant missionaries was rejected, the writer proceeds to describe the unity which is to be approved:

"An important movement for Catholic unity has appeared in Japan. A Japanese branch of the Anglican and Orthodox Eastern Churches Union has been organized in Tokyo. Of this the Russian Archbishop Nicolai is a patron, our own Bishop McKim is vice-president, and the Rev. Charles F. Sweet, an American priest, is secretary. The organizing proceedings occurred at Mr. Sweet's house, with the approval of Bishops McKim and Cecil, who were unavoidably absent. The Russian Archbishop came. The question was raised whether anything at present hindered intercommunion without the necessity of reference to home authorities. The Russians affirmed their independence in the matter, and their ability to enter into communion with us on their own responsibility when convinced of the propriety of such action."

But this is an old story. The Roman Catholics and the Greek, Coptic, Armenian and Jacobite Churches are true

Churches, but Protestantism has no true Church. It is not "Catholic." It does not cast out devils in the right way.

The Emmanuel movement of the Episcopal Church is a back number compared with the new development of the Reformed Episcopal Church which Bishop Fallows calls "Immortalism," or "spiritualism with the fake left out." But hundreds of thousands believe there is no fake in spiritualism any more than there is in medicine. The Bishop believes that communicating with the dead will become a routine study in our public schools, like arithmetic or geography, and that "as the study of immortalism becomes systematized and widespread greater advances will be made, and we shall talk with spirits as we now talk with material persons." Taking the rôle of a prophet Bishop Fallows says:

"In the enlightened days to come, we will be able to converse with spirits of departed friends and relatives. Their state will be made known to us thru these communications. They will be able to advise us on knotty problems, and the ancient Biblical days, when communications from above were comparatively common, will have returned in part."

He tells us that "telepathy is already an established fact," and that "eminent scientists and thinkers of many lands have already announced their belief in spirit communications." Bishop Fallows ought not to make such assertions. It is not true that telepathy is already an established fact. It would, we think, be difficult to find one psychologist of established reputation who has pronounced for it. Indeed, it has no acceptance in science. It is true that several physicists and astronomers like Crookes and Lodge and Schiaparelli and Flammarion, and we may add the penologist and anthropologist Lombroso, are its advocates, but these are the rare exceptions, and we are surprised that Bishop Fallows does not know the fact.

A Jewish Loan to Turkey There are 4,000,000 Jews in Western Europe, 2,000,000 in the United States, and about as many as the two combined in Russia and Rumania all of whom are anxious to escape, and who are

fleeing to this country and some of them to Palestine as fast as they can. American Jews themselves think they have as many of their poor immigrants here as they can care for, and they are quite willing to divert the stream elsewhere, and particularly to Turkey, which is near at hand and is waiting to be occupied and developed under a constitutional government. Dr. Isidore Singer would have Turkey pledged by a big loan to give Jewish immigrants fair conditions. He would have the Jewish bankers of this country and Europe negotiate a loan to Turkey of \$250,000,000, which Turkey is supposed to need for rehabilitation, for schools, railroads and ships, and to exploit her enormous mineral and agricultural resources. That is a big sum, and we do not believe Turkey would be justified in borrowing it. She needs no navy, and there is private money in plenty ready to be invested as soon as investors think it safe. But when Turkey wants a moderate loan we would have the Jews accept it, but insisting on conditions. We remember that the Rothschilds refused to lend to Russia because of the Jewish persecutions.

Death of Clyde Fitch

Clyde Fitch, the American playwright, died in Paris last Saturday after an operation for appendicitis. He was only forty-four years old. He has had about fifty of his plays on the stage, and nearly all have won success. They belong to what is called the legitimate drama, never coarse, vulgar or licentious. At one time four of his plays were on the Broadway stage at the same time. He was a graduate of Amherst College, which gave him the degree of Master of Arts in recognition of his dramatic success. In college he was much interested in the dramatic organizations and played women's parts. His first plan was to give himself to interior decoration or architecture, but while preparing for such a career he wrote a one-act play which had a good run, and shortly after Richard Mansfield engaged him to write a play for him to take the character of Beau Brummel. It had a tremendous success and turned him into the dramatic career. He went to Paris and made a most careful study of

dramatics, and thereafter produced plays in great numbers, especially excelling in delineation of feminine characteristics. His plays were always entertaining even if somewhat lacking in any deep study of character, and he was sometimes called superficial. In a late interview Mr. Fitch gave this rule for successful plays:

"Create characters that are human beings; place them in situations that are reflections of life itself; make them act—and above all things make them talk—like human beings. If you do this sincerely and do it well, then—well, then you *may* have success."

His own plays followed this formula, and always entertained those who heard them, even if there was no great insight into character.

Spread of Islam

In his recent work, entitled "Der Islam, geschichte, Lehre und Recht," Prof. Martin Hartmann, who holds the chair of Arabic in the Berlin Seminary for Oriental Languages, has furnished what is doubtlessly the most reliable statistics on the spread of Islam. According to this authority there are nearly thirteen million confessors of this faith in Europe. Of these 3,295,000 are found in Turkey, whose total population is 6,130,000. European Russia with the Caucasian districts has in a total population of 112,134,000 no less than 8,410,000 Moslems; Bulgaria reports 603,000; Bosnia and the Herzegovina, 549,000 under Austrian supremacy. Greece has a Moslem contingent of 60,200; Rumania, of 45,000, in a total population of 6,435,000, and Servia with its 15,000 Mohammedans has about the same percentage of Moslems. In Great Britain there are 2,700 and in France 2,000 confessors of Islam. The total population of Asia is computed at seven hundred and seventy millions, and the religion numerically strongest in this vast host is Buddhism; but Islam can claim more than twenty per cent. of the whole mass, namely: 158,142,730. Its poorest representation is found in Japan and Korea, where in fifty million people there are scarcely more than fifteen hundred Islam traders. In British India there are sixty-two and a half million Moslems, and in Dutch India twenty-five million. The largest percentage of Moslems in Asia are found in Persia, where in a total population of nine millions

there are 8,900,000 of this creed. Next in order is Asiatic Turkey, where in a total of seventeen million the Moslem contingent is 11,190,000. Arabia has three and a half millions; Afghanistan four and three-eighths millions; China twenty-three and a third millions (in a total of 351,250,000), and Siam one million in a total of six million people. In Africa, Morocco heads the list, there being in its eight million inhabitants 7,840,000 Moslems, while Egypt with the Sudan numbers among their 9,821,000 people, 8,544,300 Mohammedans; the Congo State in its nineteen million people has one million; Abyssinia in its eight millions, 800,000; and Liberia in its one and a half millions, 450,000 Moslems. Germany rules many Moslems, namely, eight and one-half millions in a total population of nearly twelve millions in its African possessions; while France in thirty-one and a half million African subjects has 16,676,000 confessors of Islam; and of Great Britain's nearly thirty-one millions there are 7,775,000 Moslems. The Mohammedan contingent in Australia and Oceanica is only 18,000, and in America 56,000. The total Islamic population of the whole world is now 223,985,780. Among these only about ten millions are Shiites, or heretical followers of Mohammed's son-in-law Ali, and these are found chiefly in Persia, and to a certain extent also in Caucasia. Fully one hundred and sixty million Moslems are living under Christian governments.

A correspondent from Tecumseh, Okla., greatly admires President Taft's orders forbidding the political use of the positions as Supervisor of the Census; but he smiles when he sees how little attention is likely to be paid to it in his neighborhood. He sends us clippings from the country papers telling of the appointment of Mr. C. C. Chapell, who has been prominent in political matters, as supervisor for twelve counties; and adds:

"While the position is not so very lucrative, yet it carries a considerable amount of patronage with it which will enable Mr. Chapell to reward possibly as many as 300 friends with a \$4 per day job."

In a recent controversy he first advocated the retaining the county seat where it

was, and then changed over to the other side. He was nominated for his position by the national committeeman for the State. Our correspondent adds:

It is because the Republican party of Oklahoma is machine ridden that the Democrats have had such large majorities in the State elections.

You will not wonder that I smiled when I read the order in your editorials and also read who was appointed and accompanying comments in our local paper.

The American School Peace League, which held its first annual meeting in Denver last month in connection with the convention of the National Education Association, offers three prizes of \$75, \$50 and \$25 for the best three essays on:

1. The United States, the Exemplar of an Organized World.
2. The History of International Arbitration.
3. The History and Significance of the Two Hague Peace Conferences.
4. The Opportunity and Duty of the Schools in the International Peace Movement.
5. The Evolution of Patriotism.

These prizes are open to seniors in the Normal Schools of the United States, and the seniors of the Preparatory Schools of the United States. We cordially endorse the work the League is attempting to do in the schools. The price of one torpedo boat, \$225,000, would enable the League to affect for generations to come the attitude of thousands of American children, and would probably do more to insure peace for the United States than all the \$20,000,000 Dreadnoughts ex-President Roosevelt would like to get.

We recall that more than nine years ago we published an article by Dr. Frederick A. Cook who was then planning a dash for the South Pole, and who argued that, while the land about the Antarctic Circle is wholly uninhabited, it could be inhabited by a people like the Esquimos, and that exploration is well worth while, even commercially. This illustrates how devoted he has been for many years to his main purpose to attain the unattained. In this connection we may say that we do not quite agree with our correspondent, Mr. Bridgman, that there is an element of unfairness in anticipating the heralded plans of Mr. Peary and in utilizing all Peary's previous discoveries

We think it is also proper to recognize the remarkable enterprise of the New York *Herald* in securing such full and early accounts, on which all other journals have had to depend.

A curious incident connected with the postal order department of the Government throws light on the need of postal banks. It was observed in the Kansas City post office that a large number of postal orders given out were not presented to be cashed within the usual time and investigation was made. It turned out that a large number of foreigners who did not trust banks nor stockings had learned that money was safe deposited in the post office. So they paid 10 cents to have the office hold the money to their own order. They found they could get it out when they wanted it, and the news spread abroad until the post office was made a bank against its will, and that without paying any interest, but being paid for holding the money. A postal bank would have charged nothing and paid 2 per cent.

In her article of July 4 opposing woman's suffrage, Miss Chittenden remarked that "the Suffragists are not very proud of Utah," and specified the fact that the women's vote helped to elect to Congress the much married B. H. Roberts. A correspondent writes us that he would have been elected just the same without the women's votes, and that, in fact, they might very consistently have opposed his election, and many of them probably did oppose it. For after Congress in 1895 had past the enabling act, and the convention met to frame a constitution and was debating whether to incorporate a woman suffrage clause, the one man most conspicuous for a vigorous antagonism was this same B. H. Roberts. He belongs to Miss Chittenden's party.

One law for rich and poor, white and black, should be the rule, Gov. Joseph M. Brown, of Georgia, seems to think. A white man disguised himself as a negro and assaulted a young white woman. He was convicted and sentenced to the chain gang. But he was rich, and one

of the most prominent men in South Georgia, and so powerful were the interests in his behalf that the Prison Commissioners asked the Governor to mitigate his sentence so as to keep him out of the chain gang; but the Governor refused. If the criminal had been a negro he would have found no one to intercede for him, but a mob might have saved him from the chain gang.

Why should not the British Parliament treat Ireland as fairly and trustfully as it has South Africa? They are afraid to give Ireland a local Parliament for fear it will rebel. But the major part of South Africa actually did rebel, and yet within ten years a Parliament is given the colonies, and when the question was up in the House of Lords General Botha sat, an honored visitor, on the same floor with the peers and bishops to see and praise. The granting of a constitution to South Africa was a piece of profound statesmanship and has borne the best of fruit. Similar freedom is the only way to secure and maintain Irish loyalty.

For a peculiar ornament to the new capitol at Harrisburg the authorities contracted for a magnificent statue of Matthew S. Quay, the head boss and boodler of Pennsylvania. It was finished two years ago, but Governor Stewart will not take it. It has not been set up. The State sickens whenever the thought of it recurs. The sculptor, Karl Bitter, after holding it so long, has just shipped it to Governor Stewart, but he "relucts." Senator Quay was a mighty power in the State, but Holy Scripture tells us that while the righteous shall be held in everlasting remembrance, the name of the wicked shall have a different fate.

The prohibition of the sale of alcoholic liquors worked so well during the late general strike in Sweden that, by order of the King and the Minister of the Interior, it is to be continued for a while longer. Why not make it permanent? Perhaps the Minister of the Treasury fears that the income from state-controlled saloons under the Swedish system will fall off.

Insurance

The Field for Life Insurance.

The Travelers' Insurance Company prints in its *Agents' Record* an interesting table prepared by Lucius McAdam, an actuary, wherein an estimate is made of the uninsured people in the United States. The table, which is reproduced herewith, eliminates all persons under fifteen and over sixty-five years of age and considers only 50 per cent. of the people insured and insurable. No account is taken of industrial and assessment policies, which would materially increase the number of insured. Life insurance agents who are inclined to be pessimistic may well feel encouraged by the figures in the table. Verily the field is white unto the harvest.

States.	Lives insurable.	Lives insured.	Per cent. insured to ins'able.
Alabama	914,348	69,617	7.61
Arizona	61,466	9,756	15.87

THE Los Angeles City Council, according to *The Insurance Press* has passed an ordinance making it compulsory for baby carriages, gocarts and wheelbarrows to display red and white signal lights at night. This is a step in the right direction which may well be followed by other cities. Too many baby carriages, gocarts and wheelbarrows have lately, in imitation of automobiles, been exceeding the speed limit, and without the signal lights with which they must now be provided in Los Angeles they have become extra-hazardous.

Now that we are coming to the idea of the conservation of our natural resources it is a hopeful sign when a Minnesota county commissioner is fined \$50 and costs for having negligently caused a forest fire. If the example of the Minnesota Forestry Commissioner should be rigorously followed in other States not only the people of Minnesota but those in the sister States would realize the necessity of care during the dry season. There is too great a tendency toward carelessness in this day and generation, and carelessness costs money. It would tend to decrease carelessness if the careless ones were made to pay for their carelessness and the damage that arises because of it.

Most of us are inclined to think that a boiler explosion is a rare event. Few realize the large number of such explosions that take place in the United States during a year's time. The following figures from *Power* will be surprising to most laymen:

"In this country alone, within the last twenty years, more than 10,000 boilers have been blown to pieces, resulting in the death of more than 10,000 persons, the injury of more than 20,000 others, and almost inestimable property loss. Boiler insurance, necessitating inspection at stated intervals, and the efforts of State or city inspectors have been effective in reducing the number of explosions. But even with the improvements in design and better methods of operation required by inspectors boiler explosions are more numerous than there is reason for."

Toys in the World of Commerce

Toys are very often regarded as of small consequence in the world of commerce. In point of fact many persons seem to have a tendency to regard them as a negligible quantity. And yet over fifty million dollars worth of toys have been imported into the United States during the last ten years. Fragile things for the most part and good only for children's playthings, the total transactions in them mount well up in the millions in the gross. The importation of toys was not by any means all the business that was done in them as trade commodities. During the same period something like five million dollars worth of toys were exported. During the past fiscal year the high water mark has been reached in so far as export trade in toys is concerned. The total value of exported toys during that time has for the first time exceeded one million dollars. The value of toys imported has fallen somewhat since 1908, when the total value of imported toys was \$7,250,000. This year the figures were \$5,000,000 in round numbers.

Toy manufacturers in the United States had investments in plants and in stock of less than \$1,000,000 in 1880. In 1905 such investments had grown to \$4,750,000. The value of importations of toy merchandise has in the meantime shown a constantly increasing trend. Trade in toys has largely been developed during the past ten or a dozen years.

Toys are very largely "made in Germany." That is to say Germany is by far the largest source of supply in the United States. The little German town of Sonneberg, in the Duchy of Saxe-Meiningen on the Röhren, is perhaps the largest toy manufacturing center. In addition to its summer resort business it has been credited with the annual production of some 24,000,000 toy units having an aggregate value of \$4,000,000. Nuremberg and certain other sister cities are also to be reckoned with as toy makers. The value of toys imported into

the United States from Germany in 1908 was \$6,500,000, out of a total of \$7,250,000 imported that year. Some of the other toy contributing countries in 1908 furnished toys valued as follows: France, \$180,472; Austria-Hungary, \$179,418; Japan, \$177,720; Belgium, \$61,551, and the United Kingdom, \$57,725.

....It is asserted that French and American capitalists will soon set up a great steel plant at Mexico City, making an outlay of \$50,000,000.

....There are now 6,977 national banks, with an authorized capital of \$948,931,775 and bond-secured circulation amounting to \$667,508,731.

....Arrangements have been made for the shipment of wheat from Western Canada to Europe by way of the railway across the Isthmus of Tehuantepec.

....The record loss on the part of local banks of \$1,000,000 on interior movement last week indicates that something is being done financially looking toward the moving of the crops.

....In 1908 the Pennsylvania Railroad Company carried 141,659,543 passengers, not one of whom was killed as the result of an accident to a train. The number of passengers injured by train accidents was 102, against 452 in 1907.

....The National Monetary Commission held a recent conference in New York. As one result of this conference it is more than probable that a campaign of education will be inaugurated looking toward the promulgation of the central bank scheme.

....New Jersey's taxes assessed on corporations this year amount to \$2,522,358. Among the companies taxed are the Steel Corporation and the American Tobacco, Rock Island, Amalgamated Copper, International Harvester, and International Mercantile Marine companies.

The Independent

VOL. LXVII NEW YORK, THURSDAY, SEPTEMBER 16, 1909 No. 3172

Survey of the World

Mr. Harriman's Death

Mr. E. H. Harriman died on Thursday last at the age of sixty-one. He had been in ill health for months, and had returned to this country from the search of health abroad, to secure the needed home comforts and rest. There was much secrecy as to his condition, with a view to avoiding the effect of the knowledge of his danger on the markets. For this reason when he died shortly after noon the knowledge of it was withheld till after the stock market had closed. He was the most potent factor in railroad enlargement and control that the country has seen, and at the time of his death was in charge of the management, direct or indirect, of 100,000 miles of railway. He was born at Hempstead, L. I., and his father was rector of a small church and afterward had no regular charge, so that the family was brought up in the very strictest economy. He became a clerk in a broker's office in his teens, was very attentive to business, and in some way managed to buy a seat in the Stock Exchange soon after he was of age. He gained thoro knowledge as a broker of the conditions of the stocks dealt in and continued to make money in times when others failed. As a railroad man he began as vice-president of the Illinois Central, under Stuyvesant Fish. Mr. Harriman went into the Union Pacific with the Kuhn-Loeb-Rockefeller interests in 1897, who had bought it of the United States for \$14,000,000. It was little more than a right of way and a streak of rust. He then began, as Chairman of the Executive Committee, to develop it, to rebuild it and made it one of the best properties in the country. He got control of the Southern Pacific, which had been a rival, but just failed in

the attempt to get the control of the Northern Pacific. He added one railroad after another to his system, and he was dictator in the lines he directly controlled, and always with the purpose of development. In addition he directed Atlantic and Pacific steamship lines comprising fifty-four thousand miles of water transportation. A traveler can start from New York and go as far as Hong Kong, a distance of 9,902 miles, without leaving the Harriman lines, and most of the return journey could be made by traveling on still other lines of his. When the Mexican roads which are now being built are completed his system will also extend from Seattle at the north to Guadalajara at the south, a distance of 3,169 miles. He had other big projects in view at the time of his death. The funeral on Sunday was simple, and only a few special friends were invited. To the surprise of many stocks advanced sharply on the day after his death, perhaps from a desire to get possession of stock in the Union Pacific for the control at the approaching election of directors.

The Saratoga Democratic Conference

New York State Democrats held a conference in Saratoga last week for the purpose of eliminating differences and lifting the party to a higher plane. There were 450 representatives present from every county, as many as would attend a delegate convention. Judge Alton B. Parker was made temporary chairman. He particularly attacked the extravagances of the Republican party:

"The contrast between an extravagant and wasteful administration and an economical one will appear from a comparison of the ordinary expenditures of Government for the last four

years of Mr. Roosevelt's term and the last four years of Mr. Cleveland.

MR. ROOSEVELT.		MR. CLEVELAND.	
Fiscal Years.		Fiscal Years.	
1900	\$508,747,305	1894	\$397,749,817
1907	578,300,502	1895	376,195,208
1908	650,552,125	1896	352,179,446
1909	695,244,002	1897	365,774,159
Total \$2,501,884,284		Total \$1,441,895,770	

"Thus it appears that the ordinary expenditures of government under Mr. Roosevelt exceeded those under Mr. Cleveland by \$1,058,988,414."

So with New York State:

"During the last year of the long service of Governor Hill the total State appropriations were a little over \$13,000,000. For fifteen years now the State has been under control of the Republican party and year by year the expenditures have steadily increased, until they have now reached the sum of \$66,000,000. In other words, after more than a century of existence as a State it required \$13,000,000 to defray the expenses of government, but after fifteen years of Republican rule it requires nearly three times as much."

Thomas M. Osborne attacked recreant Democrats:

"When we see so-called Democratic Representatives in Congress voting to fasten the shackles of protection still firmer upon an outraged country; when we see so-called Democratic legislators coming to the rescue of the most obnoxious men and measures of Republican reaction, we may ourselves well echo the questions, 'What is a Democrat? What are Democratic principles?'"

The Hon. E. M. Shepard was made permanent chairman. In his address he insisted that the principle of tariff reform should be taken up by this conference and advocated day and night and in and out of season as a cardinal doctrine of Democracy. He was earnest in his advocacy of the proposed amendment for an income tax. He declared that if the Democratic party did not take up this income tax amendment as an issue the Republicans certainly would. He had a good word to say for Governor Hughes and for his direct nomination ideas. Among the principles which Judge Her- rick urged were vigorous opposition to all extension of Federal power; a tariff for revenue only. Mr. Bryan sent a letter in which he asks for strong indorsement of income tax and for specific demand for free raw material and substantial reduction of tariff on manufactured articles. The platform adopted by the Conference and intended as a model for

similar conferences thru the country was as follows:

"A strict construction of constitutions, both State and Federal, that the rights of the States and people respectively may be preserved.

"Loyal support of the Federal Government in the exercise of all its constitutional powers, eternal vigilance in watching and detecting and vigorous and persistent opposition to any and all extensions of Federal power that trench upon those reserved to the States or to the people.

"Enforcement of the laws by State and Federal authorities against criminal combinations and trusts in restraint of trade.

"A tariff for revenue only; no Government subsidy and no special interests, either directly or thru protective tariff.

"Equal and uniform taxation; taking no more money from the people than the just needs of government economically administered requires.

"The abandonment at the earliest moment practicable of our imperialistic venture in the Philippine Islands, first safeguarding their independence by sufficient guarantees.

"Steady adherence to the principle of home rule and local self-government by the State and each of its political subdivisions.

"Rigid economy in Government expenditures.

"Election of United States Senators by the direct vote of the people.

"Reform in our registration and in enrollment laws, so that personal registration and enrollment shall be required in every political subdivision of the State. Reform in our methods of election so that each elective officer shall be the separate, deliberate and intelligent selection of the voters of the State.

"Reform in our methods of nominating candidates for public office so that nominating conventions shall be composed of representatives directly chosen by the members of the party.

"Reform in our primary laws so as to give to every citizen greater direct influence in naming candidates for office and surrounding the primaries with such safeguards as will insure their honesty and providing the necessary time and legal machinery to insure the choice of a majority of the voters being respected and enforced in convention and committee.

"No interference with the personal liberty of any citizen except such as is essential to secure the equal rights of all citizens.

"Taxation of corporations by States alone.

"A Constitutional amendment authorizing the levy of a Federal income tax."

End of the Strike The strike of the 5,000 workmen of the Pressed Steel Car Company at McKee's Rocks, Pa., has come to an end after lasting almost two months, and the men have returned to work after a vote in favor by 20 to 1. The car company today sent out the following statement:

"The company has not agreed or promised to increase at this time the wages of its work-

men, but does expect that as general business conditions improve its workmen will share in the benefits resulting therefrom. Up to the present time, while there have been additional orders for cars, there has been no improvement in prices.

"The company has not promised to abandon the piece pooling system, but if it develops that this system can be improved by increasing the number of pools and reducing the number of men in a pool this will be done.

"The company has arranged that the amount deducted for accident insurance shall be plainly stated on the pay envelopes, and the men receive cards indicating that they are entitled to benefits under the insurance plan.

"The company has never knowingly tolerated any imposition upon its employees, and intends that all employees shall always have fair and proper treatment. For this purpose it has established an information bureau for the investigation of any complaints its employees make, and all complaints that have already been made have been and will be promptly investigated.

"The company will not tolerate any grafting or other imposition. For six weeks past the strikers have been offered these conditions."

It is claimed by the men that their demands have been substantially met except in the matter of wages. The investigation by Commissioner Neill, of the Bureau of Labor, showed abuses of the strike-breakers held in the works during the strike, but nothing that could be called peonage.

Domestic Items The opinion prevails that Tammany will nominate Judge Gaynor for Mayor of New York. Mr. Murphy seems to be so inclined, and Democratic leaders are pressing it. A considerable so-called independent movement has been started to put him in nomination before the regular Democratic convention. Mr. Hearst's Independence League will not support Judge Gaynor if he is nominated by Tammany.—President Taft makes no utterance in the Ballinger-Pinchot quarrel. He is simply hearing both sides and reserving his conclusion, which may be made known during his Western trip.—The President has appointed the commission whose business it will be, under the new tariff law, to control properly the maximum and minimum provisions. The commission consists of Prof. Henry C. Emery, of the chair of economics at Yale; James B. Reynolds, Assistant Secretary of the Treasury, and

Alvin H. Sanders, who is especially familiar with the agricultural conditions of the West.—Testimony has been taken before a royal commission at Montreal to investigate frauds which have cost Montreal millions of dollars. It has been shown that in the Fire and Police departments appointments were openly dealt in at a price of \$200 each, and that promotions were likewise open to purchase. In the Public Works Department contracts were awarded thru a go-between, who conducted negotiations for the Aldermen and the contractors. On contracts let this year and totaling \$660,000, it was shown that the excess price amounted to \$130,000.

Aviation America captured the honors in the aviation contest at Brescia, Italy, as at Reims, France, thru the efforts of Glenn H. Curtiss. He got the Grand Prize of about \$6,000 for speed in making five laps of the ten kilometer course, about thirty-one miles altogether, in 49 minutes and 24 seconds. Rougier, of France, took second place in 70 minutes, 18 seconds. Curtiss allowed Rougier to take the first prize for altitude by his 100 meter flight, contenting himself with about half that height. The prize for quick starting from the ground was also won by Curtiss with a record of 8½ seconds. He did not enter the passenger carrying contest but took the Italian author, Gabriele d'Annunzio, on a short flight. The Blériot monoplane did not do as good work as at Reims.—Capt. Samuel F. Cody, the American aviator who has been for many months experimenting without success under the auspices of the British military authorities at Aldershot, has finally got his machine under control, and has broken the record for cross-country flight, covering a distance of more than forty miles in a little over an hour, rising to the height of 400 feet and circling round the spire of the village church.—M. Lefebvre, who did such excellent work at Reims, was killed by a fall at Juvisy, France, while making a trial trip on a new Wright machine. The cause of the accident is not known.—Orville Wright has been making successful flights on the Tempelhof parade ground near Berlin during the week and the

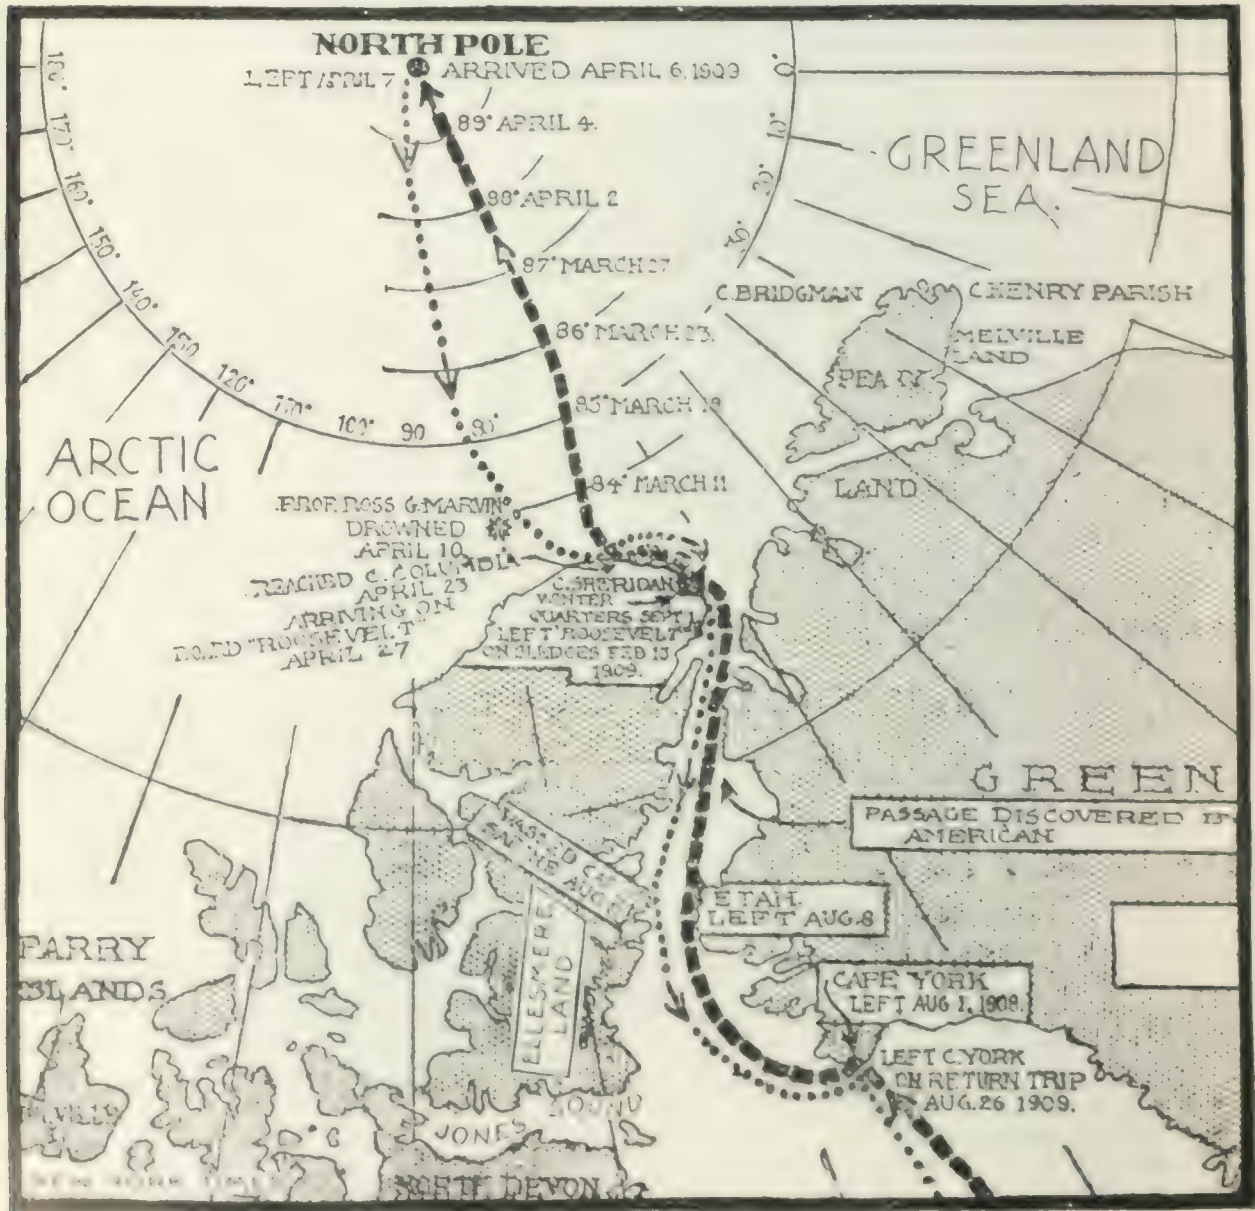

Germans have become as enthusiastic over aeroplaning as they have been over dirigibles. He has carried passengers, risen to a height 330 feet and made flights of over an hour.

Lord Rosebery Attacks the Government

The most severe blow that the finance bill of the Asquith ministry has yet received is the speech made at Glasgow by Lord Rosebery, former Liberal premier. He denounced the budget as a "revolution which puts the future of Great Britain in the melting pot, and which in the best interests of the nation should not become law." The arguments now advanced for taxing land would apply to any other form of property, and the state's guarantee of property rights would be worth-

less. His attitude on the question may be best given in his own words:

"The Government has set out to attack the land industry by every means in its power. Landowners are damned, according to the spirit of the age, for holding any property at all and doubly damned for holding property in land. The budget seeks to establish an inquisition unknown previously in Britain and a tyranny unknown previously to mankind. I cannot imagine why the Government is so hostile to individual liberty, so partial to bureaucracy. A new system of bureaucracy has been established under the name of liberty, which is not Liberalism but socialism. I have come to the conclusion that the Government wishes the Lords to throw out the budget and is daring the upper house to do so, but the Lords are not likely to do what is expected of them. The great danger under the budget is the doctrine of socialism with which the Government is dallying. There are scores of millions lying idle in the banks to-day because of apprehension with regard to the Government's financial policy."

MAP OF PEARY'S ROUTE TO THE NORTH POLE.

The Conquest of the North Pole*

BY ROBERT E. PEARY

[Commander Peary's narrative of his journey to the North Pole is of such importance and thrilling interest that we add extra pages in order to publish it in full. The *New York Times*, which has secured the exclusive rights to Mr. Peary's article, has kindly permitted us to give it our readers in this issue. —EDITOR.]

BATTLE HARBOR, Labrador (via Marconi Wireless, Cape Ray, N. E.), September 9.—The steamer "Roosevelt," bearing the North Polar Expedition of the Peary Arctic Club, parted company with the "Erik" and steamed out of Etah Ford late in the afternoon of August 18, 1908, setting the usual course for Cape Sabine. The weather was dirty, with fresh southerly winds. We had on board twenty-two Eskimo men, seventeen women, and ten children, 226 dogs, and some forty-odd walrus.

We encountered the ice a short distance from the mouth of the harbor, but it was not closely packed and was negotiated by the "Roosevelt" without serious difficulty. As we neared Cape Sabine the weather cleared somewhat, and we past close by Three Voort Island and Cape Sabine, easily making out with the naked eye the house at Hayes Harbor occupied by me in the winter of 1901-02.

From Cape Sabine north there was so much water that we thought of setting the lug sail before the southerly wind; but a little later appearance of ice to the northward stopped this. There was clean open water to Cape Albert, and from there scattered ice to a point about abreast of Victoria Head, thick weather and dense ice bringing us some 10 or 15 miles away.

From here we drifted south somewhat, and then got a slant to the northward out of the current. We worked a little further north and stopped again for some hours. Then we again worked westward and northward till we reached a series of lakes, coming to a stop a few miles south of the "Windward's" winter quarters at Cape Durville. From here, after some delay, we slowly worked a way northeastward thru fog and broken ice of medium thickness thru one night and the forenoon of the next day, only emerging into open water and clear weather off Cape Fraser.

From this point we had a clear run thru the middle of Robeson Channel, uninterrupted by either ice or fog, to Lady Franklin Bay. Here we encountered both ice and fog, and, while working along in search of a practicable opening, were forced across to the Greenland coast at Thank God Harbor.

The fog lifted there and enabled us to make out our whereabouts; and we steamed north thru a series of leads past Cape Lupton, and thence southward toward Cape Union. A few miles off that cape we were stopped by impracticable ice, and we drifted back south to Cape Union, where we stopped again.

We lay for some time in a lake of water, and then, to prevent being drifted south again, took refuge under the north shore of Lincoln Bay, in nearly the identical place where we had our unpleasant experiences three years before. Here we remained for several days during a period of constant and at times violent northeasterly winds.

Twice we were forced aground by the heavy ice; we had our port quarter rail broken and a hole stove in the bulwarks; and twice we pushed out in an attempt to get north, but we were forced back each time to our precarious shelter.

Finally, on September 2, we squeezed around Cape Union and made fast in a shallow niche in the ice; but after some hours we made another short run to Black Cape, and hung on to a grounded bit of ice. At last, a little after midnight of September 5, we passed through extremely heavy running ice into a stream of open water, rounded Cape Rawson, and passed Cape Sheridan.

Within a quarter of an hour of the same time we arrived years before—7 a. m., September 5—we reached the open water extending beyond Cape Sheridan. We steamed up to the end of it, and it appeared practicable at first to reach Porter Bay, near Cape Joseph Henley, which I had for my winter quar-

ters. But the outlook being unsatisfactory, I went back and put the "Roosevelt" into the only opening in the floe, being barred close to the mouth of the Sheridan River, a little north of our position three years prior.

The season was further advanced than in 1905; there was more snow on the ground, and the new ice inside the floe bergs was much thicker. The work of discharging the ship was commenced at once and rushed to completion. The supplies and equipment we sledged across ice and sea and deposited on shore. A house and workshop were built of board, covered with sails and fitted with stoves, and the ship was snug for winter in shoal water, where she touched bottom at low tide. The settlement on the stormy shores of the Arctic Ocean was christened Hubbardville.

Hunting parties were sent out on September 10, and a bear was brought in on the 12th, and some deer a day or two later.

On September 15 the full work of transporting supplies to Cape Columbia was inaugurated. Marvin, with Dr. Goodsell and Borup and the Eskimos, took sixteen sledge loads of supplies to Cape Belknap, and on the 27th the same party started with loads to Porter Bay. The work of hunting and transporting supplies was prosecuted continuously by the members of the party and the Eskimos until November 5, when the supplies for the spring sledge trip had been removed from winter quarters and deposited at various places from Cape Colan to Cape Columbia.

In the latter part of September the movement of the ice subjected the ship to a pressure which listed her to port some 8 or 10 degrees, and she did not recover till the following spring. On October 1 I went on a hunt with two Eskimos across the field and Parr Bay and the peninsula, made the circuit of Clemants Markham Inlet, and returned to the ship in seven days with fifteen musk oxen, a bear and deer. Later in October, I repeated the trip, obtaining five musk oxen, and hunting parties secured some forty deer.

Professor McMillan went to Columbia in November and obtained a month of good observations, returning in Decem-

ber. In the December moon Borup moved the Hecla depot to Cape Colan; Bartlett made a hunting trip overland to Lake Hazen, and Hansen went to Clemants Markham Inlet. In the January moon Marvin crossed Robeson Channel and went to Cape Bryant for tidal and meteorological observations; Bartlett crossed the channel and made the circuit of Newman Bay, and explored the peninsula. After he returned Goodsell went to Markham Inlet and Borup toward Lake Hazen, in the interior, on hunting trips.

In the February moon Bartlett went to Cape Hecla, Goodsell moved some more supplies from Hecla to Cape Colan, and Borup went to Markham Inlet on a hunting trip. On February 15 Bartlett left the "Roosevelt" with his division for Cape Columbia and Parr Bay. Goodsell, Borup, McMillan and Hansen followed on successive days with their provisions. Marvin returned from Bryants on February 17 and left for Cape Columbia February 21. I brought up the rear February 22.

The total of all divisions leaving the "Roosevelt" were 7 members of the party, 59 Eskimos, 140 dogs and 23 sledges. By February 27 such of the Cape Colan depot as was needed had been brought up to Cape Columbia, the dogs were rested and double rationed and harnessed, and the sledges and other gear overhauled.

Four months of northerly winds during the fall and winter instead of southerly ones, as during the previous season, led me to expect less open water than before, but a great deal of rough ice, and I was prepared to hew a road through the jagged ice for the first hundred miles or so, and then cross the big lead.

On the last day of February Bartlett, with his pioneer division, accomplished this, and his division got away due north over the ice on March 1. The remainder of the party got away on Bartlett's trail, and I followed an hour later.

The party now comprised seven members, of the expedition, seventeen Eskimos, 133 dogs and nineteen sledges. One Eskimo and seven dogs had gone to pieces.

A strong easterly wind, drifting snow, and temperature in the minus marked

our departure from the camp at Cape Columbia, which I had christened Crane City. Rough ice in the first march damaged several sledges and smashed two beyond repair, the teams going back to Columbia for other sledges in reserve there.

We camped ten miles from Crane City. The easterly wind and low temperature continued. In the second march we passed the British record made by Markham in May, 1876—82.20—and were stopped by open water, which had been formed by the wind after Bartlett passed. In this march we negotiated the lead and reached Bartlett's third camp. Borup had gone back from here, but missed his way, owing to the faulting of the trail by the movement of the ice.

Marvin came back also for more fuel and alcohol. The wind continued, forming open water all about us. At the end of the fourth march we came upon Bartlett, who had been stopped by a wide lake of open water. We remained here from March 4 to March 11.

At noon of March 5 the sun, red and shaped like a football by excessed reflection, just raised itself above the horizon for a few minutes, and then disappeared again. It was the first time I had seen it since October 1.

I now began to feel a good deal of anxiety because there were no signs of Marvin and Borup, who should have been there for two days. Besides, they had the alcohol and oil, which were indispensable for us. We concluded that they had either lost the trail or were imprisoned on an island by open water, probably the latter.

Fortunately, on March 11 the lead was practicable, and leaving a note for Marvin and Borup to push on after us by forced marches, we proceeded northward. The sounding of the lead gave 110 fathoms. During this march we crossed the 84th parallel and traversed a succession of just-frozen leads from a few hundred yards to a mile in width. This march was really simple.

On the 14th we got free of the leads and came on decent going. While we were making camp a courier from Marvin came and informed me he was on the march in the rear. The temperature was 59 below.

The following morning, March 14, I sent Hansen with his division north to pioneer a trail for five marches, and Dr. Goodsell, according to the program, started back to Cape Columbia. At night Marvin and Borup came spinning in with their men and dogs steaming in the bitter air like a squadron of battleships. Their arrival relieved me of all anxiety as to our oil supply.

In the morning I discovered that Mc Millan's foot was badly frost bitten. The mishap had occurred two or three days before; but McMillan had said nothing about it in the hope that it would come out all right. A glance at the injury showed me that the only thing was to send him back to Cape Columbia at once. The arrival of Marvin and Borup enabled me to spare sufficient men and dogs to go back with him.

This early loss of McMillan was seriously disappointing to me. He had a sledge all the way from Cape Columbia, and with his enthusiasm and the powers and physique of the trained athlete I had confidence in him for at least the 86th parallel; but there was no alternative.

The best sledges and dogs were selected, and the sledge loads brought up to the standard. The sounding gave a depth of 325 fathoms. We were over the continental shelf, and, as I had surmised, the successive leads crossed in the fifth and sixth marches composed the big lead and marked the continental shelf.

On leaving this camp the expedition comprised 16 men, 12 sledges and 100 dogs. The next march was satisfactory as regards distance and character of going. In the latter part there were pronounced movements in the ice, both visible and audible. Some leads were crossed, in one of which Borup and his team took a bath, and we were finally stopped by an impracticable lead opening in front of us.

We camped in a temperature of 50 below. At the end of two short marches we came upon Hansen and his party in camp, mending their sledges. We devoted the remainder of the day to overhauling and mending sledges and breaking up our damaged ones for material.

The next morning I put Marvin in the lead to pioneer the trail, with instructions to make two forced marches to

bring up our average, which had been cut down by the last two short ones. Marvin carried out his instructions implicitly. A considerable amount of young ice assisted in this.

At the end of the tenth march, latitude 85.23, Borup turned back in command of the second supporting party, having traveled a distance equivalent to Nansen's distance from this far to his farthest north. I was sorry to lose this young Yale runner, with his enthusiasm and pluck. He had led his heavy sledge over the floes in a way that commanded every one's admiration, and would have made his father's eyes glisten.

From this point the expedition comprised 13 men, 10 sledges and 70 dogs. It was necessary for Marvin to take a sledge from here, and I put Bartlett and his division in advance to pioneer the trail.

The continual daylight enabled me to make a moderation here that brought my advance and main parties closer together and reduced the likelihood of their being separated by open leads.

After Bartlett left camp with Henderson and their division, Marvin and I remained with our divisions twenty hours longer, and then followed. When we reached Bartlett's camp he broke out and went on and we turned in. By this arrangement the advance party was traveling while the main party was asleep, and vice versa, and I was in touch with my advance party every twenty-four hours.

I had no reason to complain of the going for the next two marches, tho for a less experienced party, less adaptable sledges or less perfect equipment it would have been an impossibility.

At our position at the end of the second march Marvin obtained a satisfactory sight for latitude in clear weather, which placed us at 85.48. This result agreed very satisfactorily with the dead reckoning of Marvin, Bartlett and myself. Up to this time the slight altitude of the sun had made it not worth while to waste time in observations.

On the next two marches the going improved, and we covered good distances. In one of these marches a lead delayed us a few hours. We finally ferried across on the ice cakes.

The next day Bartlett let himself out,

evidently for a record, and reeled off plump 20 miles. Here Marvin obtained another satisfactory sight on latitude, which gave the position as 86.38, or beyond the farthest north of Nansen and Abruzzi, and showed that we had covered fifty minutes of latitude in three marches. In these three marches we had past the Norwegian record of 86.14 by Nansen and the Italian record of 86.34 by Cagni.

From this point Marvin turned back in command of the third supporting party. My last words to him were, "Be careful of the leads, my boy."

The party from this point comprised nine men, seven sledges and sixty dogs. The conditions at this camp and the apparently unbroken expanse of fairly level ice in every direction reminded me of Cagni's description of his farthest north, but I was not deceived by the apparently favorable outlook, for available conditions never continue for any distance or any length of time in the arctic regions.

The north march was over good going, but for the first time since leaving land we experienced that condition, frequent over these ice fields, of a hazy atmosphere in which the light is equal everywhere. All relief is destroyed, and it is impossible to see for any distance.

We were obliged in this march to make a detour around an open lead. In the next march we encountered the heaviest and deepest snow of the journey, through a thick, smothering mantle lying in the depressions of heavy rubble ice. I came upon Bartlett and his party, fagged out and temporarily discouraged by the heart-racking work of making a road.

I knew what was the matter with them. They were simply spoiled by the good going on the previous marches. I rallied them a bit, lightened their sledges, and sent them on encouraged again.

During the next march we traveled through a thick, low-lying, smoky haze drifting over the ice before a biting air from the northeast. At the end of the march we came upon the Captain camped beside a wide open lead with a dense black water sky northwest, north, and northeast. We built our igloos and turned in, but before I had fallen asleep I was roused out by a movement of the ice and found a startling condition of affairs—a rapidly widening road of black

water ran but a few feet from our igloos. One of my teams of dogs had escaped by only a few feet from being dragged by the movement of the ice into the water.

Another team had an equally narrow escape from being crushed by the ice blocks piled over them. The ice on the north side of the lead was moving around eastward. The small floor on which were the Captain's igloos was drifting eastward in the open water, and the side of our igloos threatened to follow suit.

Kicking out the doors of the igloos, I called to the Captain's men to pack their sledges and be ready for a quick dash when a favorable chance arrived.

We hurried our things on our sledges, hitched the dogs, and moved on to a large floe west of us. Then leaving one man to look out for the dogs and sledges, we hurried over to assist the Captain's party to join us.

A corner of their raft impinged on the ice on our side. For the rest of the night and during the next day the ice suffered the torments of the damned, surging together, opening out, groaning and grinding, while the open water belched black smoke like a prairie fire. Then the motion ceased; the open water closed; the atmosphere to the north was cleared, and we rushed across before the ice should open again.

A succession of laterally open leads were crossed, and after them some heavy old ice; and then we came to a layer of young ice, some of which buckled under our sledges, and this gave us a straight way of six miles to the north. Then came more heavy old floes covered with hard snow. This was a good long march.

The next march was also a long one. It was Bartlett's last hit. He let himself out over a series of large old floes steadily increasing in diameter and covered with hard snow.

During the last few miles I walked beside him or in advance. He was very solemn and anxious to go further, but the program was for him to go back from here in command of the fourth supporting party, and there were no supplies for an increase in the main party.

In this march we encountered a high wind for the first time since the three days after we left Cape Columbia. It was dead on our faces, bitter and insist-

ent, but I had no reason to complain; it was better than an easterly or southerly wind, either of which would have set us adrift in open water, while this was closing up every lead behind. This furnished another advantage of my supporting parties. True, by so doing it was pressing to the south the ice over which we traveled, and so robbing us of a hundred miles of advantage.

We concluded we were on or near the 88th parallel, unless the north wind had lost us several miles. The wind blew all night and all the following day. At this camp, in the morning, Bartlett started to walk five or six miles to the north to make sure of reaching the 88th parallel. While he was gone I selected the forty best dogs in the outfit and had them doubled, and I picked out five of the best sledges and assigned them expressly to the Captain's party. I broke up the seventh for material with which to repair the others, and set Eskimos at the work.

Bartlett returned in time to take a satisfactory observation for latitude in clear weather, and obtained for our position 87.48, and that showed that the continued north wind had robbed us of a number of miles of hard-earned distance.

Bartlett took the observation here, as had Marvin five camps back, partly to save my eyes, but largely to give an independent record and determination of our advance. The observations completed and two copies made, one for him and the other for me, Bartlett started on the back trail in command of my fourth supporting party, with 2 Eskimos, 1 sledge and 18 dogs.

When he left I felt for a moment pangs of regret as he disappeared in the distance, but it was only momentary. My work was still ahead, not in the rear. Bartlett had done good work and had been a great help to me. Circumstances had thrust the brunt of the pioneering upon him, instead of dividing it among several, as I had planned.

He had reason to take pride in the fact that he had bettered the Italian record by a degree and a quarter and had covered a distance equal to the entire distance of the Italian expedition from Franz Josef Land to Cagni's farthest north. I had given Bartlett this

position and post of honor in command of my fourth and last supporting party, and for two reasons—first, because of his magnificent handling of the "Roosevelt"; second, because he had cheerfully stood between me and many trifling annoyances on the expedition.

Then there was a third reason. It seemed to me appropriate, in view of the magnificent British record of arctic work, covering three centuries, that it should be a British subject who could boast that, next to an American, he had been nearest to the Pole.

With the disappearance of Bartlett I turned to the problem before me. This was that for which I had worked for thirty-two years; for which I had lived the simple life; for which I had conserved all my energy on the upward trip; for which I had trained myself as for a race, crushing down every worry about success.

For success now, in spite of my years, I felt in trim—fit for the demands of the coming days and eager to be on the trail. As for my party, my equipment and my supplies, I was in shape beyond my most sanguine dreams of earliest years. My party might be regarded as an ideal which had now come to realization—as loyal and responsive to my will as the fingers of my right hand.

Four of them carried the technique of dogs, sledges, ice and cold as their heritage. Two of them, Hansen and Ootah, were my two companions to the farthest point three years before. Two others, Egingwah and Sigloo, were in Clark's division, which had such a narrow escape at that time, and now were willing to go anywhere with my immediate party and willing to risk themselves again in any supporting party.

The fifth was a young man who had never served before in any expedition, but who was, if possible, even more willing and eager than the others for the princely gifts—a boat, a rifle, a shotgun, ammunition, knives, etc.—which I had promised to each of them who reached the pole with me; for he knew that these riches would enable him to wrest from a stubborn father the girl whose image filled his hot young heart.

All had blind confidence so long as I was with them and gave no thought for the morrow—sure that whatever hap-

pened I should somehow get them back to land. But I dealt with the party equally. I recognized that all its impetus centered in me, and that whatever pace I set it would make good. If any one was played out I would stop for a short time.

I had no fault to find with the conditions. My dogs were the very best, the pick of 133 with which we left Columbia. Almost all were powerful males, hard as nails, in good flesh, but without a superfluous ounce, without a suspicion of fat anywhere, and, what was better yet, they were all in good spirits.

My sledges, now that the repairs were completed, were in good condition. My supplies were ample for forty days, and with the reserve represented by the dogs themselves could be made to last fifty.

Pacing back and forth in the lee of the pressure ridge where our igloos were built, while my men got their loads ready for the next marches, I settled on my program. I decided that I should strain every nerve to make five marches of fifteen miles each, crowding these marches in such a way as to bring us to the end of the fifth long enough before noon to permit the immediate taking of an observation for latitude.

Weather and leads permitting, I believed I could do this. If my proposed distances were cut down by any chance, I had two means in reserve for making up the deficit.

First—To make the last march a forced one, stopping to make tea and rest the dogs, but not to sleep.

Second—At the end of the fifth march to make a forced march with a light sledge, a double team of dogs, and one or two of the party, leaving the rest in camp.

Underlying all these calculations was a recognition of the ever-present neighborhood of open leads and impassable water, and the knowledge that a twenty-four hours' gale would knock all my plans into a cocked hat, and even put us in imminent peril.

At a little after midnight of April 1, after a few hours of sound sleep, I hit the trail, leaving the others to break up camp and follow. As I climbed the pressure ridge back of our igloos I set another hole in my belt, the third since I started. Every man and dog of us was lean and flat-bellied as a board, and as hard.

It was a fine morning. The wind of

the last two days had subsided, and the going was the best and most equable of any I had had yet. The floes were large and old, hard and clear, and were surrounded by pressure ridges, some of which were almost stupendous. The biggest of them, however, were easily negotiated either thru some crevice or up some huge brink.

I set a good pace for about ten hours. Twenty-five miles took me well beyond the eighty-eighth parallel. While I was building my igloos a long lead formed by the east and southeast of us at a distance of a few miles.

A few hours' sleep and we were on the trail again. As the going was now practically horizontal, we were unhampered and could travel as long as we pleased and sleep as little as we wished. The weather was fine and the going like that of the previous day, except at the beginning, when pickaxes were required. This and a brief stop at another lead cut down our distance. But we had made 20 miles in ten hours and were half way to the eighty-ninth parallel.

The ice was grinding audibly in every direction, but no motion was visible. Evidently it was settling back into equilibrium and probably sagging due northward with its release from the wind pressure.

Again there was a few hours' stop, and we hit the trail before midnight. The weather and going were even better. The surface, except as interrupted by infrequent ridges, was as level as the glacial fringe from Hecla to Columbia, and harder.

We marched something over ten hours, the dogs being often on the trot, and made twenty miles. Near the end of the march we rushed across a lead 100 yards wide, which buckled under our sledges and finally broke as the last sledge left it.

We stopped in sight of the eighty-ninth parallel, in a temperature of 40 degrees below. Again a scant sleep and we were on our way once more and across the eighty-ninth parallel. This march duplicated the previous one as to weather and going. The last few hours it was on young ice, and occasionally the dogs were galloping. We made twenty-five miles or more, the air, the sky and the bitter wind burning the face till it

crackled. It was like the great interior ice cap of Greenland. Even the natives complained of the bitter air. It was as keen as frozen steel. A little longer sleep than the previous ones had to be taken here, as we were all in need of it. Then on again.

Up to this time, with each successive march, our fear of an impassable lead had increased. At every inequality of the ice I found myself hurrying breathlessly forward, fearing that it marked a lead, and when I arrived at the summit would catch my breath with relief—only to find myself hurrying on in the same way at the next one. But on this march by some strange shift of feeling, this fear fell from me completely. The weather was thick, but it gave me no uneasiness.

Before I turned in I took an observation, which indicated our position as 89.25. A dense, lifeless pall hung overhead. The horizon was black and the ice beneath was a ghastly, chalky white with no relief—a striking contrast to the glimmering, sunlit fields of it over which we had been traveling for the previous four days. The going was even better, and there was scarcely any snow on the hard, granular, last summer's surface of the old floes, dotted with the sapphire ice of the previous summer's lakes. A rise in temperature to 15 below reduced the friction of the sledges, and gave the dogs the appearance of having caught the spirits of the party. The more sprightly ones, as they went along with tightly curled tails, frequently tossed their heads with short, sharp barks and yelps. In twelve hours we made 40 miles. There was no sign of a lead in the march.

I had now made my five marches and was in time for a hasty noon observation thru a temporary break in the clouds, which indicated our position as 89.57. I quote an entry from my journal, some hours later:

"The Pole at last! The prize of three centuries, my dream and goal for twenty years, mine at last! I cannot bring myself to realize it. It all seems so simple and commonplace. As Bartlett said when turning back, when speaking of his being in these exclusive regions which no mortal had ever penetrated before: 'It is just like every day!'"

Of course, I had many sensations that

made sleep impossible for hours, despite my utter fatigue—the sensations of a lifetime; but I have no room for them here.

The first thirty hours at the Pole were spent in taking observations; in going some 10 miles beyond our camp and some 8 miles to the right of it; in taking photographs, planting my flags, depositing my records, studying the horizon with my telescope for possible land, and searching for a practicable place to make a sounding. Ten hours after our arrival the clouds cleared before a light breeze from our left, and from that time until our departure, in the afternoon of April 7, the weather was cloudless and flawless. The minimum temperature during the thirty hours was 33 below, the maximum 12.

We had reached the goal, but the return was still before us. It was essential that we reach the land before the next spring tide, and we must strain every nerve to do this.

I had a brief talk with my men. From now on it was to be a big travel, little sleep and a hustle every minute. We would try, I told them, to double march on the return—that is, to start and cover one of our northward marches, make tea and eat our lunch in the igloos, then cover another march, eat and sleep a few hours, and repeat this daily.

As a matter of fact, we nearly did this, covering regularly on our homeward journey five outward marches in three return marches. Just as long as we could hold the trail we could double our speed, and we need waste no time in building new igloos.

Every day that we gained on the return lessened the chances of a gale destroying the track. Just above the eighty-seventh parallel was a region some 50 miles wide which caused me considerable uneasiness. Twelve hours of strong, easterly, westerly or northerly wind would make this region an open sea.

In the afternoon of the 7th we started on our return, having double-fed the dogs, repaired the sledges for the last time, and discarded all our spare clothing to lighten the loads.

Five miles from the pole a narrow crack filled with recent ice, thru which

we were able to work a hole with a pick-axe, enabled me to make a sounding. All my wire, 1,500 fathoms, was sent down, but there was no bottom. In pulling up the wire parted a few fathoms from the surface, and lead and wire went to the bottom. Off went reel and handle, lightening the sledges still further. We had no more use for them now.

Three marches brought us back to the igloos where the Captain turned back. The last march was in the wild sweep of a northerly gale, with drifting snow and the ice rocking under us as we dashed over it.

South of where Marvin had turned back we came to where his party had built several igloos while delayed by open leads. Still further south we found where the Captain had been held up by an open lead and obliged to camp. Fortunately the movement of these leads was simply open and shut, and it took considerable water motion to fault the trail seriously. While the Captain, Marvin, and, as I found out later, Borup, had been delayed by open leads, we seemed to bear a patent charm, and at no single lead were we delayed more than a couple of hours. Sometimes the ice was fast and firm enough to carry us across; sometimes a short detour, sometimes a brief halt for the lead to close, sometimes an improvised ferry on an ice cake, kept the trail without difficulty down to the tenth outward march. Igloos there disappeared completely, and the entire region was unrecognizable. Where on the outward journey had been narrow cracks there were now broad leads, one of them over five miles in width, caught over with young ice. Here again fortune favored us, and no pronounced movement of the ice having taken place since the Captain passed, we had his trail to follow. We picked up the old trail again north of the seventh igloos, followed it beyond the fifth, and at the big lead lost it finally.

From here we followed the Captain's trail, and on April 23 our sledges passed up the veritable edge of the glacier fringe a little west of Cape Columbia. When the last sledge came up I thought my Eskimos had gone crazy. They yelled and called and danced themselves helpless. As Ootah sat down on his sledge he remarked in Eskimo:

"The devil is asleep or having trouble with his wife, or we never should have come back so easily."

A few hours later we arrived at Crane City, under the bluffs of Cape Columbia, and after putting four pounds of pemmican into each of the faithful dogs to keep them quiet, we had at last our chance to sleep. Never shall I forget that sleep at Cape Columbia. It was sleep, sleep, then turn over and sleep again. We slept gloriously, with never a thought of the morrow or of having to walk, and, too, with no thought that there was to be never more a night of blinding headache. Cold water to a parched throat is nothing compared with sleep to a numbed, fatigued brain and body.

Two days we spent here in sleeping and drying our clothes. Then for the ship. Our dogs, like ourselves, had not been hungry when we arrived, but simply lifeless with fatigue. They were different animals now, and the better ones among them slept on with tightly curled tails and uplifted heads and their hind legs treading the snow with pistonlike regularity.

We reached Hecla in one march and the "Roosevelt" in another. When we got to the "Roosevelt" I was staggered by the news of the fatal mishap to Marvin. He had been either less cautious or less fortunate than the rest of us, and his death emphasized the risk to which we had all been subjected, for there was not one of us but had been in the sludge at some time during the journey. The big lead, cheated of its prey three years before, had at last gained its human victim.

The rest can be quickly told. McMillan and Borup had started for the Greenland coast to deposit caches for me. Before I arrived a flying Eskimo courier from me overtook them with instructions that the caches were no longer needed, and that they were to concentrate their energies on tidal observations, etc., at Cape Morris K. Jesup and north from there.

These instructions were carried out, and after their return in the latter part of May McMillan made some further tidal observations at other points. The supplies remaining at the various caches were brought in, and on July 18 the

"Roosevelt" left her winter quarters and was driven out into the channel pack of Cape Union.

She fought her way south in the center of the channel and passed Cape Sabine on August 8, or thirty-nine days earlier than in 1908 and thirty-two days earlier than the British expedition in 1876. We picked up Whitney and his party and the stores at Etah. We killed seventy-odd walrus for my Eskimos, whom I landed at their homes. We met the "Jeanie" off Saunders Island and took over her coal and cleared from Cape York on August 26, one month earlier than in 1906.

On September 5 we arrived at Indian Harbor, whence the message, "Stars and Stripes nailed to north pole," was sent vibrating southward thru the crisp Labrador air. The culmination of long experience, a thoro knowledge of the conditions of the problem gained in the last expedition—these, together with a new type of sledge, which reduced the work of both dogs and driver, and a new type of camp cooler, which added to the comfort and increased the hours of sleep of the members of the party, combined to make the present expedition an agreeable improvement upon the last in respect to the rapidity and effectiveness of its work and the lessened discomfort and strain upon the members of the party.

As to the personnel, I have again been particularly fortunate. Captain Bartlett is just Bartlett—tireless, sleepless, enthusiastic, whether on the bridge or in the crow's nest or at the head of a sledge division in the field. Dr. Goodsell, the surgeon of the expedition, not only looked after its health and his own specialty of microscopes, but took his full share of the field work of the expedition as well, and was always ready for any work. Professor Marvin and McMillan have secured a mass of scientific data, having made all the tidal and most of the field work, and their services were invaluable in every way.

Borup not only made the record as to the distance traveled during the journey, but to his assistance and his expert knowledge of photography is due what I believe to be the unequalled series of photographs taken by the expedition.

Hansen in the field and Percy as steward were the same as ever, invaluable in

their respective lines. Chief Engineer Wardwell, also of the last expedition, aided by his assistant, Scott, kept the machinery up to a high state of efficiency and has given the "Roosevelt" the force and power which enabled her to negotiate apparently impracticable ice. Mr. Gashue, the mate, who was in charge of the "Roosevelt" during the absence of Captain Bartlett and myself, and Bos'n Murphy, who was put in charge of the station at Etah for the relief of Cook, were both trustworthy and reliable men, and I count myself fortunate in having had them in my service. The members of the crew and the firemen were a distinct improvement over those of the last expedition. Every one of them was willing and anxious to be of service in every possible way. Connors, who was promoted to be bos'n in the absence of Murphy, proved to be particularly effective. Barnes, seaman, and Wiseman and Joyce, firemen, not only assisted Marvin and McMillan in their tidal and meteorological observations on the "Roosevelt," but Wiseman and Barnes went into the field with them on their trips to Cape Columbia, and Condon and Cody covered 1,000 miles hunting and sledging supplies.

As for my faithful Eskimos, I have left them with ample supplies of dark, rich walrus meat and blubber for their winter, with currants, sugar biscuits, guns, rifles, ammunition, knives, hatchets, traps, etc., and for the splendid four who stood beside me at the Pole a boat and tent each, to requite them for their energy and the hardship and toil they underwent to help their friend Peary to the North Pole.

But all of this—the dearly bought years of experience, the magnificent strength of the "Roosevelt," the splendid energy and enthusiasm of my party, the loyal faithfulness of my Eskimos—could have gone for naught but for the faithful necessities of war furnished so loyally by the members and friends of the Peary Arctic Club. And it is no detraction from the living to say that to no single individual has the fine result been more signally due than to my friend the late Morris K. Jesup, the first president of the club.

Their assistance has enabled me to tell the last of the great earth stories, the story the world has been waiting to hear for three hundred years—the story of the discovery of the North Pole.

The Pole

BY HARRY H. KEMP

AND so 'tis known at last, what men have sought
For centuries, and found not! Time on time
And day and night innumerable it lay
In its white vastness, lapped by chilly waves,
Where grinding ice-fields with reverberate roar
Crash in the polar tempest, mile on mile.
Oh, thus 'twill be until the end of Time:
From triumph to triumph and from height to height
The seeking Soul of Man will ever soar
Until she end the quest.

It is no Pole.

No new world in the sky, no land unknown,
That she would find; these are but symbols vague
Of the Great Quest she follows. What she seeks
Is to unloose the riddle of herself.
The riddle of the Universe in turn
Will yield itself and make an alphabet
To spell the riddle ultimate of God.

—JAMES M. MASON

THE AERIAL TOURNAMENT

at
REIMS

by
GEORGE F. CAMPBELL WOOD

*MEMBER OF THE
AERO CLUB OF AMERICA*

LIKE the tournaments of old, this most modern of contests occupied a week and more. On the eve of the opening day a ceaseless, endless stream of mud-bespattered vehicles and pedestrians—for the rain fell in torrents—filled the slippery, cobbled streets and sidewalks of the town, hurriedly seeking shelter in their respective and long-reserved resting places. The fumes of exploded gasoline and the snorting and panting of thousands of motors filled the air, and the noise was reverberated in the narrow streets until the whole town resounded as with the rattle of musketry, the comparison being suggested by an old Champenois who in 1870 had fought for his France and lost. From the windows of those rooms which they had not let to the “Parisians” and also to many “Américains”—and they were few—the Rêmois, and especially the Rêmoises, gazed on the strange scene with amazement, and made many comments: “What a big place Paris must be for so many people to come from there, and how rich, these Parisians, to all own automobiles.” To those who, in the last few years, had been to Clermont, at the last Gordon-Bennett cup of the motoring world, and to Le Mans and Dieppe on the eve of the great motor Grands Prix, the scene was not a new one, except for the calamitous downpour, and also for a mental atmosphere of even more feverish excitement, for which the novelty and the sensational character of the coming contests were no doubt responsible. With evening came more rain and more

motor cars, the latter apparently as endless a stream as the former, and neither to cease until morning.

At dinner glum pessimism as to the morrow’s prospects was the prevalent sentiment in the crowded *salle-à-manger* of the *Lion d’Or*; never was the weather so engrossing or so exclusive a topic of conversation—a conversation carried on in many tongues—and every time the wind groaned in the hotel courtyard there would be an answering groan in the dining-room of the *Lion d’Or*, for at Reims last week the wind was a common and dreaded enemy to all.

Unlike Reims’s last great day, the one on which the Czar of all the Russias reviewed his ally’s army before countless thousands, on these same plains, Sunday broke gray, wet and gusty. This had been expected and feared, and it was with no surprise that both native and transient Reims woke up to find the black flag hoisted on the *Place de la Republique* and other points of vantage, and meaning, as all knew well, “No flying.” As a signal to stay in town, however, the flags were ignored, and, regardless of their explicitly disappointing assurance, thousands set out for the *Aerodrome* on every sort of conveyance, including their own feet, and made their way thru mud and slush to the tribunes and inclosures. The trials for the French team in the Gordon Bennett Cup, the *Prix de la Vitesse* and the *Prix du Tour de Liste* were scheduled for the day. For the cup race eliminatoires, those three Frenchmen would be select-

ed who, starting before 2 o'clock, made the fastest time on two circuits—20 kilometers; the Prix de la Vitesse was for the fastest flight on three circuits, and could also be tried for on Tuesday, Saturday and the following Sunday; the Tour du Liste was, of course, a time trial on one circuit or lap, and could be attempted every day and in every race except in the Bennett Cup race and eliminatory trials.

The official starts began to be given to the contestants at 10 o'clock, fifteen minutes being given each man to cross the line; but, because of the strong wind, none ventured forth when called upon. Guffroy, in his fleet, red-winged Esnault-Pelterie monoplane, made one attempt, but gave it up and it was not until after 11 o'clock that the strength had sufficiently gone out of the wind to enable those called to respond. Latham and Blériot then appeared, an excited murmur of recognition coming from the crowd as the heroes of the Channel crossing made preparations to start. On a small scale there appeared to be a renewal of their contest of the previous month on the shores of the Pas-de-Calais as to which should get away first, and once more Blériot won out; not only did he cross first, to the accompaniment of such a roar of applause as can be better imagined than described, but he succeeded, notwithstanding the strong wind, in getting around the first stake, a fact which was subsequently to qualify him for the French team; the Blériot XI came to earth just beyond it, while Latham fell short of it, thereby failing to qualify on this trial. The contrast between these two most famous of monoplanes was very obvious when both were seen in action at such a short interval: The Blériot XI, small, compact, mastering the wind with its flexible wings as it skimmed close to the earth; the Antoinette IV, with its greater surface, power and speed—the most birdlike machine at Betheny—seeking the more regular currents aloft in preference to fighting the surface gusts and eddies of the lower strata.

Another of the small Blériots is brought out, and Delagrange, a transition from the biplane to the monoplane, and also for many months in 1908 was

the greatest of French aviators, makes his attempt, but the wind quickly wins the struggle. The first biplanes to brave the elements—Tissandier's Wright and de Rue's Voisin—have no better success. Tissandier is pointed out as one of Wright's first pupils; he comes of a great aeronautic family, and it is recalled that his father was the sole survivor in the famous "Zenith" ascension, when that balloon rose to the asphyxiating height of over five miles, in the interests of science, but only brought down one of its crew alive—Tissandier. As to de Rue, every one tells every one else that this is Captain Ferber, with Archdeacon, the greatest pioneer in French aviation, who, being in the army, is not allowed to compete under his own name. At about noon the wind abated somewhat, but it was still blowing some 30 feet a second when those at lunch were startled to their feet by the spluttering roar of a motor from the direction of the aeroplane sheds. They were only just in time to see a Wright shoot off its rail, and, from the fact that no dropping weight or derrick was used, all knew this must be Lefebvre, the French engineer, who taught himself how to drive a Wright in Holland the previous month. Lefebvre dispenses with all the starting paraphernalia usually associated with the famous biplane, except an extra long rail, and this even when there is no wind for him to start against, and thus disposes of the legends which maintained these two things could not be done. Down the stretch, over the line, out to the first stake or beacon, around it, and off for the distant second turn, went the great white biplane, until the planes were but two thin parallel lines and the propellers two glints of light. Its distant progress down the backstretch and into the long stretch home was eagerly followed thru glasses, and as Lefebvre swept around the final stake by the sheds and came racing down the short homestretch toward the tribunes, he got a roar of welcome and of appreciation, for was he not the first to circle the course in that historic week, and was not this an appropriate feat for the first successful flying machine ever built? But the Wright kept on, with that peculiar, undulatory movement which its

notorious lack of any tail or rear horizontal surface gives to the flight of a Wright in a breeze; it just failed to complete a second circuit, excess of oil spoiling the ignition and the motor coming to a stop. Lefebvre had, however, qualified for the French team, which lacked now but one representative. But 2 o'clock came without any further successful attempts, and rain put a stop to flying for the major part of the afternoon. It was not until after 6 that the

stand, and as his strength ebbed into nothingness, the great birds slipped out, one by one, of their low-lying eyries, and noisily waking from their inaction, rose, clattering and whirring, into the air, until it was literally alive with them. The crowds had waited long and patiently, and they were more than rewarded by a sight such as no human eyes had dwelt upon before theirs, a sight to thrill the dullest and most unimaginative of minds, and one which no pen could ade-

TYPICAL CROWD AROUND THE WRIGHT MACHINE.

sky cleared and the wind died down, and a great cheer arose among the benumbed thousands as, in the long line of sheds, the doors swung on their hinges, revealing the great winged machines, lying in wait for just such a weakening in the strength of their enemy.

Since daybreak Eolus had engaged in a furious struggle to defend his realm against man's audacious attempts at encroachment—a struggle which a Homer might well have dilated on, had both he and his mythology survived to this date; but by afternoon he had made his last

quately describe. In rapid succession twelve aeroplanes took wing, at one time seven being simultaneously above the ground. When the great spectacle came to an end and the last had landed, it was found that Latham had succeeded in qualifying as France's third representative and that the three Wright pilots—as capable aviators are designated in France—to wit, Lefebvre, de Lambert and Tissandier, had finished in the lead in the two other events. It was altogether a great day for these French copies of the famous brothers' master-

piece. At the close of his last flight Lefebvre gave a marvelous exhibition before the grand stand, executing a series of turns, curves, gyrations, spiral ascents and descents, which brought the vast assemblage to its feet, shouting with delirious enthusiasm; it proved a fitting climax to a day of wonders and a thoro consolation to the many compatriots of Curtiss present, who had hoped in vain for a glimpse of their champion and representative in the coming international struggle.

The morrow, however, brought forth even greater marvels than those witnessed on the first day. The first artificial denizen of the air to appear was the Colonel Renard; with a favorable wind and its great Panhard engine going at high speed, the big yellow dirigible, Kapféer at the helm, had made a lightning trip from Meaux. Its arrival seemed a signal for the appearance of the heavier-than-air craft, for it was just at this time that they were wheeled out preparatory to starting in the Prix de la Champagne et de la Ville de Reims. This was the most important prize of the whole week, and its winner was to be he who should fly furthest without alighting. On this, the first day of competition for this prize, eighteen machines actually qualified for further trials; only fourteen men drove them, however, for Blériot piloted his four monoplanes over the line and Latham two. Only a few made any effort at a distance flight, however, the balance preferring to await developments and make their effort on the three other days designated—Wednesday, Thursday and Friday. Lefebvre flew some 13 miles, but it remained to young Paulhan, whose rise to fame has been so meteoric, to make a long flight; in the morning his big Voisin biplane circled the course five times and later in the day nearly six, covering 31 and 35 miles respectively, and giving a foretaste of what was to come later in the week. His performance excited no little interest, as the Voisins had done so little on the previous day. As is his wont, Paulhan rose to great height and went soaring above the aerodrome with a steadiness and regularity as unchangeable as to become monotonous—monotonous to

see a man fly! His machine behaved well in the breeze and seemed to bear out its builder's claim of automatic lateral stability; the famous revolving Gnome motor, which has been so closely associated with Paulhan's distance and hight records, was the subject of endless discussion. After distance came speed; Blériot brought out his big 80 horse-power racing monoplane, and prepared to attack the Wrights' time for the circuit of the day before. To the deafening clamor of its eight cylinders and the whirring of its great propeller, the Blériot XII tore around the course at great speed, looking for all the world like some giant insect winging its way over the plain. More unwieldy than his smaller monoplanes, Blériot's racer nevertheless seemed under good control of the aviator, whose seat, unlike that in the cross Channel model, is right under the great wings. At the conclusion of the circuit, the white ball, announcing a new record, was run up amid great enthusiasm. But Blériot's triumph was short lived, for just before the time limit Curtiss made his first appearance, the trim, racy-looking biplane contrasting strangely with the heavier machines about it—and on his first attempt succeeded in bettering Blériot's time. It was to the accompaniment of American cheers that the white ball rose once more. The Herring-Curtiss showed marvelous speed for a biplane, and the hopes that it would outstrip the French monoplanes and "lift" the cup ran high among its followers. In the first international race in aeronautical history—the Gordon Bennett Cup for balloons, of 1906, the lone American representative had proved the winner. Why should not history repeat itself, and America, notwithstanding her single entry, again inscribe her name first on a Gordon Bennett Cup?

The black flag was up on the Tuesday morning, and such a wind blowing that many elected not to go out to Betheny until the prospects were better, and started to explore the old town, for which the exciting events of the previous days had left them no leisure. The famous cellars containing the more famous wine had many visitors, but

more turned toward the architectural glories of the cathedral, and stood gazing at its inimitable façade, at the two great bells on the south tower which had rung on more than one historical day, or wandered thru the interior of the great church, where the peerless rose-window over the main portal and the great Gothic organ, with its thirty-five hundred pipes, equal in magic the veritable lace in stone outside, which only the Moorish wonders of the Alhambra or the Oriental magic of the Taj Mahal can surpass.

Toward afternoon it was learned that the President was coming. He arrived around 4 o'clock, but the first flights were not attempted until an hour later. Once more the Voisins covered themselves with glory. Young Bunau-Varilla, who had been given a Voisin on the occasion of his graduation from his "lycée," was the first out, and gave a remarkable exhibition in the teeth of a strong wind, Paulhan following him a little later. When the wind fell, at sunset, Blériot reconquered his record for the single circuit with a sensational burst of speed, 46 miles an hour being its average. Latham flew 20 miles, and Lefebvre did some more of his wonderful aerial gymnastics. The fourth day was another Paulhan day, for he broke all records for distance and duration of flight, staying up two and three-quarter hours, and only coming to earth when his last drop of gasoline had been fed to the whirling cylinders of his tireless Gnome.

During part of the flight Paulhan had a gusty wind to contend with, but he merely rose higher and maintained wonderful stability; after about 20 miles had been flown, two clear rainbows appeared against the dark clouds, and the sight of the great white bird soaring toward them and apparently thru them was not one to be readily forgotten. Paulhan said afterward that when he saw the rainbows he knew it meant that no wind would harm him or keep him from making a great flight. It so happened that none did. Latham was unfortunate, and it was only after six separate attempts on his three Antoinettes that he succeeded in making a flight of 20 miles. When his engine would stop and the

monoplane come gliding down, he would quickly jump out and run to another of his machines, so as to lose none of the precious time. His energy was deserving of a better result, but he had to wait until the morrow to achieve it. Curtiss failed to equal Blériot's great lap of the day before, but he bettered his own time of Monday evening by a very significant fraction. Thursday found the great distance prize still earnestly contended for. Hubert Latham was out early and flew for over an hour on his No. IV, the machine on which the first crossing of the Channel was attempted; he later took out his No. VII, which had taken him within 2 miles of Dover on July 27, and gave perhaps the most wonderful exhibition of the week, as his flyers are the most beautiful of all aeroplanes to watch when in flight. He did not fly so long as Paulhan had on the previous day, but he maintained such a very much greater rate of speed—43 miles an hour instead of 31—that he superseded him for the distance prize, with 96 miles to Paulhan's 83. Comte de Lambert also made a great flight of nearly two hours, the longest ever made on a Wright machine except by the famous Wilbur himself, while Curtiss did quite a little distance work—three laps in the forenoon and two later.

The keen competition for the Prix de la Champagne came to an end on Friday, with the victory of no other than Henry Farman; after merely qualifying on the Monday he lay low until the last day of the trials, and then startled the world with a continuous flight of considerably over three hours—a world's record—during which he covered well over 100 miles. His biplane is much slower than Curtiss's, but considerably faster than Paulhan's; it also has a Gnome motor. Every day had its hero; Paulhan and Latham had been carried in triumph on the previous evenings, and now came Farman's turn, another day ending in the wildest and most warranted of enthusiasms. Other long flights were made by Latham, Tissandier, Sommer, Delagrangé, Blériot, but it was Farman's day, and none came anywhere near equaling his great effort. The scene when he landed must have reminded him of a similar one less than twenty

months before, and yet seemingly so long ago, when, after many failures, he had succeeded in making a circular flight of 1 kilometer, and in winning the 50,000 francs of Deutsch (de la Meurthe) and Archdeacon, offered to the man who first succeeded in publicly doing this. January 13, 1908, 1 kilometer; August 27, 1909, 190 kilometers. That was the progress in the new science in those twenty months, but the enthusiasm on the first occasion had been no less than on the second, and the cheers at Betheny did not make Farman forget his first great victory at Issy-les-Moulineaux, on that clear January morning.

Farman was exhausted when he landed, it being the first time on record that an aeroplane's endurance had outlasted that of its driver, in this case a famous automobile racing man, inured to fatigue, for Farman was that before he looked skyward. This same evening had seen a re-edition of the Blériot-Curtiss duel, both seeking to improve their 10 kilometer records. Blériot's lap was a fraction of a second faster than Curtiss's; he, however, fell short of his previous best, while the fleet American clipped a couple of seconds off his own record, getting nearer his rival's best speed on every attempt.

The last two days of the great meet were a triumph for Curtiss, Blériot, Latham and Farman, four of the greatest names in aviation. It was on the Saturday that the Gordon Bennett Cup came up for decision. The morning, which was clear and calm, opened with a sensational exploit by Curtiss, who, in an attempt at the lap prize, smashed Blériot's record by nine seconds, bringing it for the first time under eight minutes. On learning the time he decided to make his trial for the cup immediately, only one attempt being allowed each contestant. As all the world knows, his great effort was crowned with success. The two circuits were covered at the same great speed as his earlier trial, and one which Blériot was unable to equal in his attempt, and as the strains of the "Star Spangled Banner" echoed over that great cosmopolitan assemblage, and the great banner itself rose slowly over that foreign field, there was no countryman

of Curtiss present who could help feeling a deep gratitude toward him for the moment procured. Thus did Glenn H. Curtiss gain a great victory for his country, his club, his firm and himself. He arrived in France but a few days before the races, with a machine which had never been put together, much less tried out, and which was different in some respects from any previously built by him. In a few days he had it mounted, tested and capable of immediate flight; he had but a day or two to tune up his engine and test his propellers, and did most of the practising in his racing trials for the minor prizes. His engine never failed him and his machine was, with Farman's, the only one which never once came down when he did not wish it to, thus establishing the Curtiss and the Gnome as the two most perfect aeronautic motors yet built. Certainly no victory was ever better planned or more deserved than that of the Herring-Curtiss, and its motto might well be that of the first great victor on these plains of Champagne, "*Veni, vidi, vici.*" Flying is a form of locomotion which some day will eclipse all others for speed, and it seemed appropriate that the first great contest in this line should be won by just that man who, on earth, has traveled faster than any of his fellows, in a vehicle of any sort—a record established by Curtiss when, in 1907, he rode a mile on a motorcycle of his construction under 27 seconds.

It has been generally admitted that the single plane flyers are faster than those consisting of superposed planes, such as biplanes and triplanes; and that the fastest and most powerful of all monoplanes, piloted by the hero of the Channel crossing, should be vanquished by the little biplane from across the Atlantic is all the more to the credit of Curtiss and of Herring. If monoplanes are to be the racers of the future, and multiplanes to be the aerial equivalent to "touring cars," Curtiss's biplane will have represented the exception which proves the rule, and will be perhaps on record later as the only multiplane which ever won a great international contest. Blériot failed by 53.8 seconds to equal Curtiss's time, but partly retrieved his lost laurels by once more beating Cur-

tiss's time on one lap, a performance which ultimately won him the prize and set the high-water mark for aeroplane speed at 47.82 miles an hour. Latham and Lefebvre were third and fourth in the Gordon Bennett Cup race, while Cockburn, Great Britain's representative, who drove a Farman, came to grief thru striking a cornstack. The only other performances of note on that historic day were Farman's, Lefebvre's and Latham's trials for the passenger-carrying prize. Farman won a second victory in this, his circuit with two passengers aboard remaining unbeaten that day and the next. The *Semaine de Champagne* came to an end on Sunday, and the day was in the nature of an apotheosis, a colossal crowd cheering on the contestants in their final efforts. Latham easily captured the height prize, soaring to over 500 feet, while Farman took second money, to the unmitigated astonishment of all those who had watched him skimming close to the ground for hour after hour on the Friday, and had imagined that he lacked either power or daring to go higher. The final trials for the Prix de la Vitesse were the occasion for Curtiss of another signal victory; he carried off the prize at the splendid speed of 47.7 miles an hour, covering the three circuits well under twenty-four minutes. Blériot was unplaced, as he had the misfortune to damage a rudder and to injure his big monoplane in the ensuing fall; the gasoline caught fire and Blériot added one more to his many narrow escapes. As it was, he was somewhat burned, a thing which had happened to him twice before within the last two months and which accounted for his lameness at the time of his Channel flight. He remained the victor in the fastest lap competition, but Curtiss came very near taking this also, his time for the second lap of his final trial in the Prix de la Vitesse being but $\frac{1}{2}$ of a second slower than Blériot's record.

The Colonel Renard and the Zodiac III had the dirigible race to themselves,

and the former proved victorious, circling the course at about 24 miles an hour; just half the speed of the Blériot 22.

Thus Curtiss and Farman were the two great victors at Reims, the one carrying off the big international event and the speed prize and taking second place to Blériot in the fastest lap contest; the other taking the 50,000 francs of the distance prize, the passenger contest, and second place to Latham in the height prize. Blériot, besides carrying off the lap prize, was second in the cup race, while Latham, first in height, was second in distance, second in speed, third in the cup race and third in the lap prize—wonderful record for the Antoinette. Outside of these four great victors, Paulhan achieved a splendid success on his Voisin, finishing third in the distance and height prizes. The Wright team scored also in nearly every contest, taking second in the passenger prize, third, fourth and fifth in the speed prize, fourth and fifth in the distance prize, fourth, fifth and sixth in the lap prize, and fourth in the Gordon Bennett Cup. Bunau-Varilla and Rougier, driving Voisins, also distinguished themselves on the final day of the meet, both in distance and height.

And now comes the question: What does it all mean? Are we really awake, or are these bewildering monsters roaring over our heads with their human freight merely fantasies of our imagination? Is it possible that the dream of ages has come true and that man has suddenly found how the shackles of gravity could be tossed from his feet? And the answer is this: That man is undoubtedly learning to fly, that he can already raise himself from the earth, and is steadily gaining in his struggle to master the elements. Light winds are already mastered and strong ones will be soon, and then the sun will rise high in the long looked for day of the flying machine, the day of which the old towers of Reims saw the first blush of dawn.

ARDSLEY-ON-HUDSON, N. Y.

Commander Peary

BY HERBERT L. BRIDGMAN

SECRETARY OF THE PEARY ARCTIC CLUB.

TWO men, clasping each other's hands on Rainbow Point, at lonely Etah, in Northern Greenland, ten years ago bade each other good-by. "Peary," said one, "I believe you will win," and with the steady look of the calm, clear eye, he said, "I believe I

shall." Two years later the same two men stood on the ice foot at Herschel Bay, on the opposite side of Smith Sound; the "Erik," anchor hove, flags flying, steam up, and all ready to leave with wife and child for home, lay a mile away. Again they clasped hands and

COMMANDER ROBERT E. PEARY IN ARCTIC COSTUME

bade each other good-by. As the boat shoved away, Peary called out: "Keep your flags up. We will keep our glasses on you, and when we can see you no longer we shall know you are safely homeward bound."

The two incidents tell the story of the quest and of the man. Not more fixt in its position, not clearer in its faith has the north star been than Peary, for almost a quarter of a century, in his quest for the point nearest to it on the globe, and with the singleness of purpose, undaunted courage, the high undivided faith in America's prowess, he has persisted until victory has crowned his efforts. Not many times in a lifetime is the country thrilled as on Monday by Peary's despatch: "Pole reached. 'Roosevelt' safe," telling in terms, which could not be mistaken that the long struggle was won, and that the days of doubt and patience and effort were ended and those of faith and persistence encouraged, rewarded. All the world unites in generous acclaim to a man, who, in the face of obstacles, which would have long ago daunted other men and turned them dis-

spirited and disappointed, seemed only stimulated to greater efforts and to higher endeavor.

One who has followed Peary's progress to the Pole sees, moreover, a plain, straightforward significance, a logical development, step after step, to a conclusion, which was almost inevitable.

Parallel after parallel has been advanced, outwork after outwork captured, until finally, like the storming party, the citadel itself was assailed and triumph secured. Think for a minute of what was known, or rather was unknown, when Peary's little boat first steamed up the river eighteen years ago, headed for the far north. Practically all that was certain was that the coasts of Smith Sound turned off to the east and to the west; whether Greenland reached to the pole; whether Ellesmere-land extended westward or northward no one knew, and as for field work and subsistence under Arctic conditions the whole world was skeptical. The traverse of the Greenland icecap in 1892 and 1895 demonstrated, beyond question, the insularity of the land mass, and in 1900 the

(LIEUTENANT PEARY AND CAPTAIN BARTLETT OF THE "ROOSEVELT")

THE "ROOSEVELT" AT OYSTER BAY.

From a photograph taken just prior to the departure of the vessel for the Pole.

complete outline and boundary were definitely delimited; an achievement for which the highest geographical honors were paid, and which, had Peary stopped, would have given him first rank among the world's geographers. Then, in 1902, the highest north ever attained by an American was reached, and in 1906 the world's record in northing was beaten; new land was discovered to the west and northwest, and, most important of all, the great easterly drift of the ice-laden current was established, so that the law of approach to the pole might be definitely discovered and the price of its possessions ascertained.

Evidently from the brief and succinct accounts which Peary has sent he has "won out," as we say in the speech of the day, but the smallest, straightest and fairest methods. He has used the information, the experience, the equipment and the assistance which he alone has developed, and has applied the knowledge which he himself had learned to

the problem of the centuries. In his training of the Eskimos alone a revolution has been wrought, and instead of being useful impedimenta in the way of the Arctic explorer, they have proved, under his faithful and inspiring leadership, the most faithful followers and the most competent coadjutors.

The whole Eskimo tribe, the Arctic highlanders, have come into the ken of the world's scientists, not as a race of pigmies or of half men, but as intelligent, reasonable practical human beings, with many qualities and characteristics like our own, who are entitled to the respect of mankind, and, best of all, to be left alone in the environment in which the Almighty has placed them.

What all this means is, of course, too early, in the first flush of success, definitely to say. It is, however, perfectly obvious that America wants its place in the corps of the world's discovery, and also reasonably certain that the other Anglo-Saxon flag is shortly to be placed

upon the opposite pole; a fact which will have no small bearing in world politics. Nations will hesitate before trying conclusions with those who have fought the force of nature to a standstill, and who have triumphed over the last obstacles which have for all time resisted the assaults of man. More than this, the generous rivalry, the cordial good feeling between Great Britain and America will be strengthened by the experience and strongly reflected in the political and commercial relations.

Upon its scientific side, of course too, the work is but just begun. The tragedy of 1884 will never be repeated, tho the plan of international circum-polar stations has much to commend the confidence and support of the nations. The

secrets of the north are, like those of the south to be unlocked, and we are to know all of the globe, as we have so far known but parts of it. Centuries may pass before we shall be able to say that we have reached the limit; that we have gathered all the facts; that we have exhausted the knowledge; and until that time comes Peary will hold the premier place as the victor discoverer. As he himself has so many times said, the knowledge that America is to the front will enhance every American's patriotism and pride in his country; and so from every point of view, national, international and scientific, for science has no frontiers, Peary's achievement marks an era in history.

BROOKLYN, N. Y.

My Knowledge of Dr. Cook's Polar Expedition

BY JOHN R. BRADLEY

[Mr. Bradley is the personal friend of Dr. Cook in his trip to the Pole, and Dr. Cook says he deserves half the credit of the achievement. In view of the late disclosures, it is well to state that this article was received by us on the morning of September 8, too late for our issue of last week. —Editor.]

THE story of Dr. Cook's successful "dash" for the North Pole, so far as my connection with the event is concerned, really began with my first acquaintance with the doctor some years ago. He interested me from the first. We had a common love of travel and discovery, and both were members of the Explorers' Club.

I had studied carefully the work he had done on the Belgian Antarctic Expedition of 1897-1899, and his successful climb of Mount McKinley in 1906. He impressed me as a seasoned and resourceful explorer, full of courage, the self-confidence that is born of knowledge, and a circumspection that is born of caution and calculation. Dr. Cook is no dreamer, no romancer; his several noted achievements attest that he is a practical and reliable man. He never tells what he is going to do, but pursues the scientific method of doing things first and

demonstrating them afterward. For three years I had often spoken to him about my desire to shoot polar bear. He had been north with Peary in 1891-1892, and his experience stimulated my eagerness to take one more big shooting trip before writing my reminiscences, which I desired to name "Hunting Big Game from the Arctic to the Equator." On my return from Asia, in December, 1906, I said to Dr. Cook: "My next will be the Arctic." In the spring of 1907 I had fully made up my mind to go that year, and invited Dr. Cook to go as my guest. That is the way the idea originated. He was to photograph Eskimos and I was to shoot walrus and polar bear. Nothing was then said about a dash for the Pole. That was a later development, but one, nevertheless, that was fully and carefully planned before we started north.

The first thing necessary was a suite

ble vessel. I wrote to Baring Brothers, of St. Johns, N. F., knowing that in the summer the sealers are idle and vessels are chartered then for hunting and fishing trips. A large sum was asked for the use of a vessel. I did not object to that, but they wanted me to be put under the command of a captain, and this I did not want. We didn't have time to build, so we decided to buy. We looked over vessels at New London first, then

transformed her into practically a new craft, staunch enough for the trip to Etah. Captain Moses Bartlett, whom I engaged to command her, said he'd just as soon be in her as any vessel he'd ever sailed in. She had cabins like a yacht—a cabin for Dr. Cook, an aft cabin for officers, and a forward cabin for eighteen sailors and a galley. Everything essential in the way of equipment was as perfect as one would have on a private

TESTING A HARPOON GUN IN NORTH GREENLAND.

The picture is of J. R. Bradley, who financed the Cook-Bradley Polar expedition.

went to Gloucester, where we found a fishing schooner named the "George Lufkin," of 111 tons, built at Essex. We figured on what it would cost to refit her, and I finally bought her. I overhauled her completely, cleaned her out, braced her fore and aft, put in new rigging and sails, sheathed her, with steel plates on bow and stern, put in a gasoline engine and gasoline tanks, and, in short, after repainting her white and gold and rechristening her the "John R. Bradley,"

yacht. We had 5,000 gallons of gasoline, provisions for two years in case of shipwreck, and everything necessary for shooting and navigation in the Arctic.

When all these preparations were complete, and about four weeks before sailing, Dr. Cook and I were lunching one day at the Holland House, and he said to me: "Why not try for the Pole?"

I replied: "Not I. Would you like to try for it?"

He said: "There's nothing that I

would rather do, it's the ambition of my life." He thought it would cost only about \$8,000 or \$10,000 more to furnish an equipment for this purpose, and we figured it out. Finally I said: "Well fit this expedition for the Pole, and say nothing to any one about it." We did not want the newspapers to get at it. Peary was waiting to go, and we did not want him to beat us into Etah and get all the dogs; moreover, I wanted to shoot on the way up and did not want to be in a hurry.

We fitted the ship according to the doctor's ideas. He believed in making the dash with as light a burden as possible. For example, stoves to burn coal oil, which Greely took north with him, weighed fifteen pounds each; our stoves weighed three pounds. Everything else was cut down the same way. At the same time we had everything that was needed for the doctor's preliminary work of preparation in his winter quarters, his camping equipment, provisions, tools, material for sleds—every necessary detail was carefully thought out and provided for. We figured this way: In case we got up to Etah and found the natives were not well, or the dogs scarce, or any other conditions unfavorable, we would call it a hunting trip, and return quietly home again.

We sailed from Gloucester, July 1, 1907. Everything went well. We put in at Sydney and Battle Harbor, Labrador, and after going a few hundred miles up the Labrador coast we crossed Davis Strait to the south end of Greenland to escape the ice, reaching the Greenland coast near Godhaven. We encountered rough weather here, but the boat stood it splendidly. After crossing we ran into considerable ice, which bent a blade of our propellor and disabled the screw, compelling us to beach the ship at Disko to make repairs; then we "hiked" out for the north again. At first we found very little ice; then we met a good deal of ice and much fog. This was at the entrance to Melville Bay near Duck Island. I had a motor boat with which I planned to shoot eider duck, but the fog was too thick, so I said: "Go on across Melville Bay." We found it very rough going. We were "nipped"

three times in the ice—that is, the ship was caught and squeezed by the pack, and once we thought we were lost. After seven days of hard work we made Cape York, where we expected to meet with northern Eskimos. We saw plenty of bear on Melville Bay, but they were on pan ice, and I couldn't get at them.

At Cape York, which is simply a point of land where a few Eskimos live, we ran into an awful storm, which made it too dangerous to approach the coast, so we decided to continue northward. As we proceeded we met blinding snowstorms, but one morning the sun came out, and the same day, about noon, we sailed into North Star Bay. Here we saw hundreds of walrus, and I got out my big harpoon. The best place to anchor, Captain Bartlett said, was at a diamond shaped head of land where the "Roosevelt" had touched some years before. We fired guns to attract the natives, and two came out to meet us in their skin canoes (or kayaks). Dr. Cook spoke to them in their own language, and as we were moving slowly they accompanied us to shore. On the other side of the point we saw the Eskimo settlement—men, women and dogs—and in an hour we had nearly the whole population of the place on board the ship. We took a census of the tribe and counted 240, which was 10 less than there were seventeen years ago. We spent five days here shooting and putting things to rights about the schooner; and with the use of the motor boat I found good sport in hunting walrus, the meat of which I gave to the Eskimos for their dogs.

Then we made our way north again, shooting ducks, seal, walrus, bear and every other kind of northern game, until we got to Etah, our destination, the northernmost settlement in Greenland, on the west coast, in latitude about 78°. It was good to get there, and especially satisfactory to realize that we had accomplished the journey to the northern limits of navigation in Smith Sound in an auxiliary schooner. This was late in August, 1907. We climbed the hills back of Etah and had fine views looking westward over Smith Sound, where the air was so clear that we could see for miles without glasses. Twenty-five miles

across is Cape Sabine, near which Greeley was picked up by Schley. There was very little ice.

Dr. Cook, the first mate and I decided to take the motor boat and provisions

had recognized Dr. Cook and called him by name.

"I am going to stay," the doctor repeated.

Then we told Captain Bartlett. Natu-

FORAGING IN THE POLAR CIRCLE.

Three walrus killed for food in the far North by members of the Cook-Bradley expedition.

for a couple of weeks' trip on the Greenland side for the purpose of finding the Eskimos who were said to live a few miles north of Etah. When we got there we found the men were all away hunting narwahl and walrus, so we camped there a couple of days and went back to the schooner. Dr. Cook and I were getting breakfast one morning, when he said:

"I'm going to stay."

"All right," I replied; "you're past twenty-one years of age. Think it over before you finally decide."

We brought all the natives down with us to Etah, and here we had quite a bunch of them. One of the older men

rally he was startled, but he said: "I suspected it from the kind of stores you put on board."

We took the ship as far north as we could, and effected a landing of the stores with great difficulty at Annootok, some miles north of Etah. Instead of clear water, we began to have the worst ice we had seen on Smith Sound, just where it chokes in and fills Kennedy Channel. We were thirteen hours landing the stores, throwing them on the coast from the motor boat and dories wherever we could. Already there had been a call for volunteers to stay with Dr. Cook, and five of my men had responded. We considered all their offers

carefully. First, the engineer—no, we needed him; then the steward—no, he was too giddy; then one of the sailors—no; then Kirby—no, he had toothache; and last, my cook, Rudolph Francke, a good, healthy man. We decided to land him with Dr. Cook, and when he had been put on shore the Doctor came on board, wrote some letters home, and we bade him good-bye. That was the last we saw of him.

I can answer fully for Dr. Cook's equipment. He had everything that could be desired. He had 150 dogs and 70 men, women and children for Eskimo companions that winter, and one white man. He had his winter house, machine shop, 40 tons of coal, 150 feet of stove-pipe (for heating his workshop and for drying walrus meat), medicines, books, pemmican, hickory for fifteen sleds, nails, screws, all tools; besides the provisions for his polar dash he had biscuit, canned goods, coffee and tea, tobacco, needles and thread—everything to begin the winter season with on September 1, 1907, to make ready for his dash to the Pole. He had September and part of October in which to build his house and have everything in readiness.

I proceeded south with the vessel and tried to make Cape Sabine, to go after musk-ox, but we had to give it up on account of the ice. It was near here, however, that I got my largest polar bear; he weighed 900 pounds. When we struck the coast of Labrador we ran into the worst storm we ever saw, in which, I afterward learned, more than seventy vessels were lost. Four men were kept working at the pumps for many hours. We made the Bay of Islands, N. F., and anchored, and the stay here gave me a week's opportunity to go hunting for caribou. At Sydney, Cape Breton, the vessel was put in dry dock, and it was found that the ice had cut the sheathing.

After my return home I was asked a good many times how Dr. Cook expected

to get back to New York. To these inquiries I replied that I had told Dr. Cook, "I am not coming up again," and he had replied, "I do not want a relief ship; I will cross the inland ice to Cape York. I can get there. I shall cross Melville Bay to Upernavik (a little Danish settlement on the southwest coast of Greenland). Once a year a blubber ship takes blubber from Upernavik. I can pay passage from there to Copenhagen."

Thus, it will be observed, Dr. Cook did exactly as he planned. He expected to return to New York, he said, about November, 1909.

Those who knew of the Doctor's plan—Mrs. Cook, Captain Bartlett and Rudolph Francke, as well as myself—have been confident that Dr. Cook has been alive and would be heard from, and that if he failed to reach the Pole he would certainly return home with the record of the Farthest North.

His intentions were, after landing at Annotok, to make his sleds and his winter quarters as soon as there was enough light to see. The details of his experiences up to the time he was last heard from on March 17, 1908, have been given to us fully by the letters brought home by Francke and by Dr. Cook's own reports during the last few days. There has never been any doubt in my mind about his safety, knowing him and his methods as well as I do. When Nansen wintered in the Far North, he and his men did what they were forced to do. They had to study conditions. The dogs may die, there may be open water, or the men may get sick or frozen—there are lots of chances of getting into trouble—but in spite of all possible calculations of disaster, I have been confident of Dr. Cook's success. He is a man who would figure ahead, and this time, as on his previous exploits, he has proved that his calculations were correct.

—NEW YORK CITY.

Dr. Cook's North-Polar Discoveries

BY MAJOR GENERAL A. W. GREELY, UNITED STATES ARMY

AUTHOR OF "THREE YEARS OF ARCTIC SERVICE," "HANDBOOK OF ARCTIC DISCOVERIES," ETC.

THE most interesting news of the present month includes the original discovery of the North Pole by Dr. Frederic A. Cook, on April 21, 1908, and its subsequent attainment by Commander Peary, on April 9, 1909.

It is of interest to note that efforts to reach the North Pole, continuing for four centuries, have now been successfully made by citizens of a nation that had no existence, even in dream or fancy, when the quest first began. It is further suggestive that the first north-polar voyage was made for commercial purposes in an age of reformation and religious enthusiasm, while the final and successful effort is in the so-called materialistic century and for an idea entirely foreign to trade or finance. The first effort to cross the North Pole was under King Henry VIII, by Robert Thorne, who sought, in 1527, to insure England's commercial advancement by a short route to China, its shortness, it was thought, compensating for its difficulties.

The geographic goal of the early sixteenth century has been sought almost unremittingly, each explorer adding his quota of experience and result for the knowledge of the world in general and for his polar successors in particular. In turn the quest has been the ardent task of the phlegmatic Dutch and the daring Norseman, of the patient Swede and the enthusiastic Frenchman, of the snow-enviored Russian and the sun-loving Italian, of the scientific German and the mountaineering Austrian, of the globe-encircling Briton and the so-designated materialistic American. In succession Great Britain, the United States, Norway, Italy and the United States have gained and held the honors of the Farthest North, until now a persistent and travel-inspired American has ended the friendly rivalry by attaining the latitude of the North geographical Pole.

Dr. Cook selected for his general line of travel that thru Smith Sound, usually known as the American route. Its en-

trance is to the west of Greenland, thru the great strait named for John Davis who discovered it more than three centuries since. Beyond are Baffin Bay and Smith Sound, waterways discovered in 1616 by the great navigator, William Baffin. There were doubters in other ages, and less than a century since there appeared on a British map of authority the legend, "Baffin Bay, discovered by W. Baffin, but now not generally believed." Smith Sound was found to open northward by Inglefield in 1851, and from 1853 to 1855 beloved Dr. Kane added thereto Kane Sea and Kennedy Channel, the latter stretching beyond the 80th parallel of north latitude. Hayes, in 1860, pushed land and sea to near the 82° N. America still further made this route its speciality by sending the "Polaris" expedition in 1870, under Charles Francis Hall, whose solitary grave on the shore of Thank God Harbor indicates the price that he voluntarily paid for his discovery of the most northern land yet seen, Grant Land, which extends to 83° 07' N. Sir George Nares's expedition traced Grant Land to its northwest extremity, Greenland to Cape Britannia, while his assistant, A. H. Markham, made a world's record by reaching 83° 20' N.

The Lady Franklin Bay International Expedition, commanded by the writer, in addition to its primary and engrossing work of scientific observations for international discussion—tidal, magnetic, meteorological, etc.—took up exploration supplementarily. Thru Lockwood and Brainard it established a new world's record (83° 24' N.), discovered a new land to the north of Greenland—now called Peary Land—and by the writer's field work explored the interior of Grant Land—across which Lockwood later reached the western ocean. The writer's discovery that Grant Land was largely an ice-free region covered with luxuriant vegetation and frequented by large numbers of musk-oxen and other smaller

game, was a factor on which Cook's success ultimately depended.

Peary's magnificent feats by the Smith Sound route are too well known to need amplification. Briefly they cover the determination of the extreme northern land discovered by Lockwood, two crossings of the inland ice of Greenland to Peary Sound, and three successful journeys northward from Grant Land over the rugged, distorted ice-floes of the Arctic Ocean. In one of these journeys he recovered the "Farthest North" for his country, $87^{\circ} 06'$ N., and in the latest voyage has duplicated the work of his successful rival, Cook, by reaching the North Pole on April 9, 1909.

Many are uninformed as to Dr. Cook's apprenticeship in exploration, an experience that in variety and extent has rarely been surpassed by polar explorers. Briefly they cover service as surgeon in one of Peary's expeditions in connection with the crossing of Greenland, where he contributed to the success of the work by field service and by professional skill, and additionally by scientific observations of ethnological interest as to the Eskimos of the Cape York region. These experiences were most valuable training for Cook's recent work, but they appear to have excited in his mind that spirit of "always roaming with a hungry heart" that Tennyson ascribes to Ulysses.

Unable to find full scope for his activities in an expedition under the Stars and Stripes, Cook volunteered for the Belgian Antarctic expedition, in the "Belgica," under de Gerlache, which wintered in 1897 in the pack off Alexander Land. This unique voyage was described by Cook in "The First Antarctic Night," it being the first expedition to winter within the Antarctic Circle.

He next appears at the antipodes of his former travel, and in an Alpine role essays the monarch of American mountains—McKinley, Alaska, 20,300 feet high. Failing at first he later announced his success in 1907 under the title "To the Top of the Continent."

The ink was scarcely dry on his Alaskan book before he started for his famous journey. He was fortunate to find a generous and co-operative supporter in Mr. John R. Bradley, who contributed largely in money, in transportation, and

in supplies. Under Bradley's auspices and in his company, Cook proceeded north in 1907, and established his permanent quarters at Annootok, Greenland, about 40 miles north of Cape Alexander. He kept one white man, Arnold Francke, with him to guard the supplies that were needful both to outfit the polar party and also to cultivate friendly relations with the natives and insure active Eskimo co-operation.

No doubt Cook carefully studied the question of route during the early winter. The old standard way was that along the east coast of Grinnell Land, where the narrow ice-foot is often piled high with enormous masses of broken ice which are thrown up by storm-action or pushed over by the moving pack during the season of spring tides. This route meant the following of the entire shore contours under most unfavorable conditions. The other route was that suggested by the discoveries and experiences of Sverdrup, 1898-1902, who had crossed Ellesmere Land from east to west, starting from Hayes Bay, and later via Jones Sound had discovered the southwestern coast of Ellesmere Land and traced it to the north side of Greely Fiord. Moreover, he had discovered to the westward Heiberg and Ringnes Lands, whose land-masses protected the waterways of the Ellesmere coast and fitted them for easy and rapid travel. The initial westward route was untried but it was full of promising probabilities. In addition Peary's ascent to the summit of Ellesmere Land, from Cape Hawkes, disclosed a southern arm to Greely Fiord and presented a royal road for travel.

Most important also was the fact, established by the writer, that Grant Land offered a certainty of game supplies that were indispensable. Cook therefore chose this latter route.

Leaving Francke to guard the permanent camp and its valuable supplies, Cook broke out very early, on February 19, 1908, in the bitterest cold of the Arctic winter. Attended by faithful and competent Eskimo subordinates, the journey was made across Kane Sea to Cape Hawkes, up Dobbin Bay and across Ellesmere Land to Greely Fiord, where about a hundred musk-oxen and other game insured the good condition

of his dogs, the confidence and contentment of his men.

At the entrance of Greely Fiord his supporting party turned back, leaving him with fully loaded sledges and within less than five hundred miles of the Pole. It was thru the return of this supporting party that came the only letters and news of the intrepid traveler until his return in 1909.

The advance over the Arctic Ocean was made by Cook with selected dogs and men, in whom he had the utmost confidence. Most fortunately the ice conditions proved to be unprecedentedly good, rendered so, it is probable, from large land-masses to the westward, which would protect from pressure the ice north of Heiberg Land. Cook's discovery, in about 84° N., of Croker Land, far distant on the western horizon, is confirmatory of this suggestion. As a visit to the new land would have lengthened his route, he decided to take no step that might lessen his chances of reaching the Pole.

The story of his northward journey over the ice of the Arctic Ocean is that of all arctic travel. Days of exhausting and often discouraging labor, nights of keen physical sufferings, deep anxieties as to the outcome of next day's travel, careful husbanding of food supplies, the limitation of food issues to the lowest point practicable with continuing strength, annoying details of camping and cooking, the exacting character of astronomical observations, the necessity of keeping records, and the unremitting guarding of the food against the ever-ravenous and thieving dogs.

Cook was surprised to find his path of travel free from the great disruptions of the pack and the consequent delays and detours—the greatest dangers and delayers of sledgemen.

For nearly sixty miles the ice conditions were exceedingly favorable—level, unbroken, free from fissures. From the brief description now available they suggest a continental ice-foot projecting from low land, somewhat like the inland ice of Greenland, or the wasting remains

of a great glacial ice-sheet, such as that in the Antarctic regions lately traversed by Shackleton.

Cook's observations showed that on April 20 he was within fourteen miles of the Pole, and that point was reached on April 21, 1909. The character of ice made it doubtful whether the location of the Pole is on the sea or on a low land entirely covered by an ice-sheet.

What a feeling of pride of achievement and sense of deeds accomplished must have entered Cook's heart on that notable day, as he displayed at the North Pole the Stars and Stripes! While personally obtaining renown, he had insured to his country a geographical honor long coveted and hard striven for by the leading nations of the world.

The outward journey was easy and featureless as compared with the return. Coming summer brought with it melting snows and wet apparel, the sea ice gradually wasted, the pack slowly disintegrated and finally made the attainment of land impossible. With decreasing food the dogs became available for emergency rations. The party appears to have been in imminent danger of perishing when a polar bear was killed. The disrupted pack obliged Cook to return south between Heiberg and Ringnes lands. Subject to the vicissitudes of a drifting pack, they lived a most precarious existence thru occasional game. Finally, by a supreme effort, they reached the shore of Jones Sound, where they subsisted on the game of the country from September, 1908, to February, 1909, when they started on their return to Annootok.

Commenting most briefly on this extraordinary journey, it is no small honor to have accomplished a geographical feat which has defied the best efforts of and with which are inextricably and immortally associated the names of such men as Hudson, Nelson, James Cook, Phipps, Scoresby, Parry, Nordenskiöld, Weyprecht, Wrangell, Andrée, and of the Americans Kane, Hayes, Hall, De Long and Lockwood—to mention only the dead.

A Realization of "Macbeth"

BY ALVAN F. SANBORN

[Maurice Georgette Leblanc Maeterlinck has just given a single performance of the "Macbeth" of Shakespeare. Only fifty spectators were admitted to this representation. The action took place in the halls of the ancient Abbey of Saint-Wandrille (for the last two years the Maeterlincks' summer home), that is to say, in the veritable Château of Macbeth. The spectators had only a few steps to take between the acts and found everywhere seats at their disposition. From first to last, they saw only persons dressed in the costume of the period; they thus had the constant illusion of being the guests of Macbeth. The roles were taken by the greatest actors of the Parisian stage, but their names were not revealed until after the representation, in order to leave to the personages of Shakespeare's play all their impressive reality. Mr. Sanborn, who was one of the fifty fortunate guests, sends us the following interesting article about the occasion.—EDITOR.]

THE influence of Georgette Leblanc upon what may be called the second part of the work of Maurice Maeterlinck has unquestionably been

INTERIOR OF THE CHAPEL OF SAINT SATURNIN
(Thirteenth century)

to speak your work. There is a collaboration loftier and more real than that of the pen; it is that of thought and of example. I have had no need to imagine painfully the resolutions and the actions of an ideal sage, or to draw from my heart the moral of a beautiful dream, necessarily a trifle vague. To listen to your words has sufficed. It has sufficed that my eyes have followed you attentively in life; they have followed thus the movements, the gestures, the habits of wisdom itself."

The "Portrait de Femme" of the relatively recent "Le Double Jardin" is (I have it from the best possible authority) a pen-picture of her whom Maeterlinck

GALLERY OF THE CLOISTER

profound. "Aglavaine et Selysette" (published in 1896) marks the entrance into the poet's life of this beautiful, brilliant and highly intellectual woman. To her Maeterlinck offered "La Sagesse et la Destinée," in the following affectionate and noble words:

"I dedicate to you this book, which is so to

has called "the unique and forceful friend, the equal comrade." In this exquisite essay he says:

"At the summit of her life the purest reason that can illuminate a being keeps watch and ward; but it shows only the grace and not the

effort of light. Nothing appeared to me colder than reason before I had seen it playing thus about the brow of a young woman, like the lamp of the sanctuary in the hands of a laughing and innocent child. . . . Her conscience is so natural and so sane that its breathing cannot be heard and that it seems to be unaware it exists. It is inflexible toward the activity it directs, but in this inflexibility is so much ease that it appears to pause to alight upon or bend over a flower, when it is really resisting with all its might an unjust sentiment or thought. A gesture, a naïf and playful word, a laughing tear dissimulates the secret of the inner struggle. Everything it acquires possesses the grace of instinct; and everything that is instinctive has acquired innocence. 'Instinct' in the words of Balzac 'is drenched in thought'; and thought covers sensibility with a clearer dew. . . . Iphigenia, Antigone, sister of charity, if it be necessary, like every woman, she will not implore destiny to inflict a fatal wound for the sake of testing in an ultimate struggle the forces marvelous, perhaps, of an unexplored heart. She has learned their number and their weight in tranquillity and in the sureness of her conscience. Barring one of those ordeals by which life forces us to the pitiless walls of a fatality or of a natural law without issue, she will take instinctively another route to the goal designated by duty. Under no circumstances will her devotion and her sacrifice be resigned; they will never abandon themselves to the

perfidious sweetness of misfortune. Always on the alert, on the defensive and full of robust confidence, she will search, up to the very last moment, for the weak spot in the event that crushes her. Her tears will be as pure, as sweet as the tears of those who do not resist the blows of fortune; but instead of dimming her sight, they will draw to it and multiply for it the light that consoles or that saves."

The above delicate fabric of beautiful phrases subtly intimates that it is the woman who is the dynamic element in the ideal life partnership of Maurice Maeterlinck and Georgette Leblanc. And, of a truth, Georgette Leblanc is pre-eminently a creature of action, a being splendidly endowed with the capacity for doing things. She possesses an inexhaustible fund of initiative, of energy, of persistency and of address. These qualities were never more in evidence than in the train of events which culminated in the recent remarkable performance at the Abbey of Saint-Wandrille of Shakespeare's "Macbeth." The moment this ancient Norman abbey became her home—one would not be surprised to learn even that she had urged

MACDUFF AND HIS ALLIES PLAN TO MARCH AGAINST MACBETH

MACBETH CONFIDES TO LADY MACBETH HIS PLOT AGAINST THE LIFE OF BANQUO

its acquisition with this single end in view—Georgette Leblanc resolved to give Shakespeare's somber drama of the Middle Ages in the medieval setting it provides; and from that time forth she focused all the resources of her strong and supple nature upon the attainment of this result. "Saint-Wandrille," she observed, jestingly (but there was grim determination under the pleasantry) "was constructed solely for 'Macbeth.'" A caprice, perhaps—"How," says the sage of Saint-Wandrille, "should she possess the necessary energy if she were devoid of ambition and of pride? How should she save the grace of woman if she did not have its innocent vanities?"—but a royal, a sublime caprice; one which every worshiper of the splendors of the past will understand, and one which every person who has been privileged to visit the venerable pile of Saint-Wandrille (an architectural jewel of the Northwest of France) must approve. The poet Abel Bonnard says:

"Saint-Wandrille is indeed a fabulous abode. Not far from Gaudeluc, near a river, at the

base of a forest, it mingles in an enchanting confusion all the styles and all the centuries from the twelfth to the eighteenth: a richly embroidered Renaissance gateway; a church of the fourteenth century, its broken columns prone on the ground, its shattered vaults revealing the sky, its windows empty save for the azure, its stones which nature surrounds and reclaims, its arches whereon natural ivy covers sculptured ivy, its immense clusters of columns which seem to be turning into clumps of trees; and, adjoining it, a cloister of the fifteenth century, with its ardent and florid architecture, with its stones striped with mosses, grown, reddened and cringed by lichens; and, everywhere, prostrate statues, busts deformed by humidity, keystones precipitated into the grass, old doors hidden by foliage, thickets of fierce brambles; and also, gardens of the and yew, great portals of the seventeenth century and structures of the same period, worldly and pompous; and, under old swollen roofs, a chapter-hall, a chapel, an infinitude of deserted halls, a labyrinth of silent corridors and rooms of the time of Louis XV with their robes of woodwork, and, especially, the great refectory of the twelfth century with its barbarous amplitude, its pillars set in the wall, its silence where the least sound is solemn, its dimness where the least light is important; and all this, not inharmonious but the reverse, all the epochs and all the styles being reconciled under the authority of Time,

like musicians under that of the conductor of the orchestra."

Had Georgette Leblanc merely desired to give a stage performance of "Macbeth" at Saint-Wandrille the undertaking would have been a relatively easy one; but what she desired was not to "play" "Macbeth," not to "act" "Macbeth," but to *re-enact* it, to "realize" it, to live over again "the terrifying minutes that precede, accompany and follow the murder of King Duncan" before spectators so few in number and so carefully dissimulated that they would be for the characters of the drama as if they were not; and, furthermore, to give these same spectators the illusion of being the guests of Macbeth in his castle at Inverness. And this was quite another matter.

She secured—and this, it is easy to believe, was by no means the least arduous of her tasks—the promise of her phlegmatic poet-philosopher husband to prepare a text which should meet the exigencies of so very special an occasion.

She wrenched the translation from him piecemeal, we are told, line by line, transcribing it herself upon scraps of paper. She searched for, and finally found, in actordom actors capable of sharing her enthusiasm and sufficiently interested in their art as art to work for love of it and to subscribe to the condition (deemed indispensable to prevent the abuses of advertising) that their identity should not be revealed to the public until after the performance. She persuaded the druggist, the sheriff, etc., of the town of Caudebec (a couple of miles distant) to accept minor parts, and the young peasants of Saint-Wandrille and the region round about to serve as figurants; and she trained them to conduct themselves as human beings and not as puppets. Not content to follow the stage traditions in the matter of costumes and household furnishings and utensils, she went to Bayeux to study the colors, lines and forms of the tapestry of Queen Mathilde. She not only conducted rehearsals, but she supervised

THE WITCHES IN THE CLOISTER

carpenters, painters and costumers. She solved the problem of limiting the number of spectators to fifty (a point regarding which she was inflexible) by an appeal to snobism (fixing the price of tickets at 200 francs each and publishing the names of subscribers), and then took the curse off the stratagem by promising to devote the profits to a well-known charity.

At last, on the night of August 28 (after more than one postponement), the witches danced about a seething cauldron in the thickets to the east of the abbey. Smoking torches appeared in the neighboring forest, and Macbeth and Banquo, emerging thence on horseback, listened to their weird and disturbing predictions, and then entered the abbey by a terrace upon which the spectators were seated, passing so close to them that they brushed them with their garments. Lady Macbeth received Macbeth in the refectory and poisoned his mind with the ambitious project which was to work his undoing. King Duncan and his mounted retinue, coming from the direction of Yvetot, rode up the abbey driveway with a great clatter of hoofs, flare of torches and blare of trumpets and dismounted in the court of honor north of the refectory. Duncan, looking around him, marveled at the clearness of the atmosphere and the beauty of the site. The stifled moans of the dying Duncan assailed the walls of the chambers adjacent to the refectory. Macbeth summoned bandits to the chapter house and ordered them to assassinate Banquo and Fleance. Macbeth gave a royal banquet in the refectory and astounded and alarmed his guests by his ravings. Macbeth consulted the witches in the cloister and saw the long line of kings descended from Banquo pass thru its galleries. Lady Macbeth, with glazed eyes and mumbling, tell-tale lips, descended the magnificent staircase of the refectory. Macbeth encountered Macduff at the refectory door and fell pierced by his sword.

The initial appearance of the witches, the arrival of Duncan (a touch of nature not on the program was the sudden appearance of Georgette Leblanc's black wolf-dog imploring a caress), and the somnambulism of Lady Macbeth, were never before, probably, made so lifelike. These spectacles alone were worth a long journey.

In attempting to "realize" Macbeth, however, Georgette Leblanc attempted a

IN THE CLOISTER
THE WITCHES OF MACBETH

thing verging so close on the impossible that it is not uncharitable to affirm that she did not meet with unqualified success. Leaving to one side (as possibly unfair, tho of vast importance) whether Shakespeare in French is really Shakespeare, it may as well be admitted that the spectator often remained unconvinced. The hoary stage conventions of meditations made vocal in soliloquies, of the reading aloud of letters (for the benefit of the audience), and of "asides"

(also for the benefit of the audience) were preserved; and the voices in the most intimate conversations were pitched to carry far. The bellows of Macbeth, after he had murdered Duncan, were quite as well calculated to wake the porter as were the subsequent knockings at the refectory door. There were no footlights, of course, and there was a welcome absence of powder and rouge and similar "make-up"; but calcium lights and other mechanical appliances were employed to produce effects, and the inquisitive eye detected a prompter under a table or behind a chair. The banquet, in spite of the care for historical accuracy with which the table was spread, did not rise above the typical stage banquet; all the guests seemed to be aware that they were present not to eat, but because their host was to see an apparition. The tombs of those who rose from the dead in the cloister were manifestly the handiwork of the Saint-Wandrille carpenter. The fight to the death of Macduff and Macbeth was a stage fight. The spectators lacked the good taste to refrain from applause, and the long waits between the acts (which they passed in a room containing modern upholstered easy chairs) put their understandings and their emotions more or less out of tune with the medievalism of the piece. The supper served them by Monsieur and Madame Maeterlinck after the play, tho exceedingly grateful to the inner man, presented the distinct disadvantage of being attended by the recent dead. The "cuttings" (which included the murders of Banquo and of Lady Macduff and her children) were as numerous as in any of the current acted versions. Furthermore, the Saint-Wandrille performance was quite as indifferent to considerations of time and of space as the stage performance. Duncan, according to the Hollinshed chronicle, was killed in the eleventh century. Now, only a few inconsiderable fragments of the Abbey of Saint-Wandrille

date from this epoch, the oldest parts of any importance being no earlier than the twelfth century, and most of them being much later. For the purist, consequently, and even for the conscientious, up-to-date stage manager to put the costumes of the time of Macbeth into this setting was very like putting colonial costumes into the setting of a modern flat. A two minutes' walk thru halls and corridors carried the spectator from the palace of Duncan at Foris to the castle of Macbeth at Inverness, and the preparations in England to march against Macbeth in Scotland took place in the very cloister in which Macbeth consulted the witches, and immediately after this consultation. Similarly, the spectator who had just been conducted into the refectory from a beautiful moonlight scene out of doors was not a little disconcerted to learn, at the end of the murder scene, that the night had been one of unprecedented severity.

In short, Georgette Leblanc "realized" not "Macbeth," but certain passages of "Macbeth." The Saint-Wandrille "Macbeth," taken broad and long, makes equally great demands upon the imagination and indulgence of the spectator with any other "Macbeth." In abolishing one set of conventions it has created another set. Georgette Leblanc has not yet found the way to "realize" Shakespeare, but it may be that she has found "the way to the way." Or it may be that the plays of Shakespeare were not designed to be "realized" in the sense in which Georgette Leblanc understands that word. It is possible that Shakespeare wrote with stage artifice in view, that he abhorred "the light of common day," and that he wished his personages to dwell forever in the shadowy borderland that lies between real life and dreams. However this may be, Georgette Leblanc provided a fresh and welcome artistic and literary sensation, and this, in these jaded times, is no mean matter.

PARIS, FRANCE.

The Seizure of the People's Water Power

BY WILLARD FRENCH

ON March 4, 1909, the majority of American citizens looked forward to a vigorous enforcement of the Roosevelt policies for the next four years.

It is probable that certain elements, notably those whose habitat is traditionally given as Wall Street, were satisfied that vigor in the enforcement of the Roosevelt policies would at least be held within the bounds of a reasonable moderation. But it is a fair assumption that an overwhelming majority of the American body politic were confident that the incoming administration would take up the public land policies where the outgoing administration had laid them down.

Within a period of less than six months many American citizens have grown doubtful whether certain elements in the present administration are working for freedom of opportunity for the individual. This doubt, early defined, has spread and intensified so rapidly that it now assumes national proportions, and goes deeper than either politics or policies. It raises the direct question of the integrity of officials in high office.

The first issue raised between what may be called, for purposes of identification, the Ballinger and Pinchot forces, and which is clearly outlined in Mr. Pinchot's speech before the National Irrigation Congress, at Spokane, was essentially a legal one. The central question involved was whether he is the better lawyer who acts only under specific affirmative legal provision, or he who acts without specific provision, provided his action is constitutional and in sympathy with the spirit of existing laws.

Out of this apparently somewhat academic question grew rapidly a second question which was practical instead of theoretical, national instead of technical, and of immediate interest and importance to every American citizen. It was

whether the property of the people, particularly within the public domain of the West, can be adequately conserved and effectively protected from theft under administration by lawyers of the Ballinger school.

Out of these two questions grew a third question, not necessarily a part of either and not necessarily influencing a decision upon either, but the dominant question squarely before the American people and their President today, upon which apparently the present issue in all its parts will be mainly determined: Whether the Interior Department is now being administered in the interests of the people or in the interests of the corporations.

Freed from hysteria and consequent exaggeration, the charges against the administration of the Interior Department since the 4th of March are these:

1. That action under the law has not been sufficiently vigorous to protect valuable water powers in public ownership from passing into unregulated and monopolistic corporate ownership.

2. That cases before the Interior Department involving enormously valuable coal lands in Alaska have been handled in the interests of the claimants under methods and policies arousing grave suspicion.

3. That the action of the Interior Department since the 4th of March in both these instances is justified neither legally nor morally, and involves radical departure from the Roosevelt policies. These policies President Taft, in his inaugural address, ratified unreservedly.

The following are the facts which furnish a basis for conclusions regarding the first charge:

Prior to the early '90s the amount of electric energy developed by water power was negligible. Today about 5,000,000 horse power are so developed, of which over one-third is controlled by thirteen concerns. Of these concerns,

the General Electric Company and the Westinghouse Electric Manufacturing Company are the most important, since they directly control over 1,000,000 horsepower, and indirectly control a vastly larger amount. This central control is increasing, both with the inevitable play of economic forces and with the ever-widening radius of electric power transmission. Transmission over a distance of 200 miles is now commercially possible, which gives an area of 120,000 square miles as tributary to a central power plant. Electrical engineers of achievement believe that 200 miles is trifling compared with the distance over which electric power can be transmitted in the near future, as the result of improved methods.

Not all the power sites on the public domain have been acquired under the power-site laws. Water companies have used the mining laws very largely for securing permanent title to lands along the streams, so as to enable them to control water powers. The title to the dam site on which is located the dam or the reservoir which supplies water for the city of Denver was obtained by entering this site as a building stone claim. This claim was sold to the patentee by the Government for a few hundred dollars. Its value is many millions. The public land laws have been perverted in this manner all over the West. Sites for summer resort hotels are frequently acquired under the mining laws, altho the land contains no mineral whatever.

Prior to the construction of the Western Pacific Railroad Company, an engineer in its employ and his associates began to locate mining claims along the line of the proposed railroad. These claims aggregated 365,000 acres. No mining was ever done upon any one of them. Before the road was built the engineer had formed a company and left the employ of the railroad. He then sold or pretended to sell to the railroad company a right of way across his supposed claims. About this time the Government stepped in and 38,000 acres of the claims were relinquished. After a hearing which cost several thousand dollars, 11,000 acres additional were defeated. Further proceedings against the 200,000 acres still covered by the claims must be had.

The following detailed information as to the control exercised by the General Electric and the Westinghouse companies has been obtained from authoritative sources. This control is shown directly or thru subsidiary corporations, or indicated by the appearance of certain individuals unquestionably connected with the controlling company. For the General Electric the subsidiary corporations are as follows:

United Electric Securities Company (Maine, 1890).

Electrical Securities Corporation (New York, 1904).

Electric Bond and Share Company (New York, 1905).

Individuals closely connected with the General Electric Company water-power control are:

Sydney Z. Mitchell, vice-president and treasurer Electric Bond and Share Company (General Electric; see above), formerly with Stone & Webster, of Boston, to be mentioned later.

J. D. Mortimer, assistant secretary Electric Bond and Share Company (General Electric; see above) and director of American Gas and Electric Company.

C. N. Mason, vice-president Electrical Securities Corporation and of United Electric Securities Company (General Electric; see above).

H. L. Doherty, president American Gas and Electric Company, which in 1908 controlled at least nineteen lighting and gas companies in various parts of the United States, and is, in turn, controlled by the Electric Bond and Share Company (General Electric; see above).

The Westinghouse concentration or group comprises the following companies:

The Security Investment Company;

Electric Properties Company (New York, 1906), successor to Westinghouse, Church, Kerr & Co.; and the

Smith interests, represented by C. Elmer Smith and S. Fahs Smith, of S. Morgan Smith Company, important manufacturers of water turbines. While C. Elmer Smith is interested in at least two General Electric power companies the Smith interests seem especially harmonious with the Westinghouse group, and are so classified.

The individual names most prominently identified are:

John F. Wallace, of New York, president Electric Properties Company.

George C. Smith, of Pittsburgh and New York, vice-president and director of the Electric Properties Company.

C. Elmer Smith, of Smith interests.

Those power companies which are admittedly Westinghouse are:

Atlanta Water and Electric Power Company, on the Chattahoochee River above At-

lanta, Ga., with an installation of 17,000 horse power. C. Elmer Smith is president and George C. Smith and S. Fahs Smith directors.

Ontario Power Company, of Niagara Falls, a Canadian Corporation on the Canadian side, with an installation of 66,000 horse power. Together with its distributing company in the United States, the Niagara, Lockport and Ontario Power Company, it is known as a Westinghouse concern, H. H. Westinghouse being president of the latter, and the majority of its stock being voted by the Electric Power Securities Company of New York, a construction company owned by Westinghouse interests.

Those power companies whose connection with Westinghouse interests is inferred from substantial evidence are:

Albany Power and Manufacturing Company, near Albany, Ga., with 3,500 horse power installed, on the Kinchatonee, and owning besides a site on the Flint River, estimated at 10,000 horse power, has for its vice-president C. Elmer Smith (Smith interests).

Electric Manufacturing and Power Company, on the Broad River, near Spartanburg, S. C., with 11,000 horse power installed, has on its directorate E. H. Jennings, of Pittsburgh, a director of the Electric Properties Company (Westinghouse).

Savannah River Power Company, on the Savannah River, near Anderson, S. C., has an installed development of 3,000 horse power, and owns besides a site of 6,000 horse power. This company has on its directorate C. Elmer Smith (Smith interests).

Gainesville Electric Railway Company, with 1,500 horse power installed, on the Chestagee River, a tributary of the Chattahoochee, near Gainesville, Ga. Eighty-five per cent. of its stock is owned by the North Georgia Electric Company (Smith interests).

North Georgia Electric Company; one development of 3,000 horse power and at least seven other power sites on the upper waters of the Chattahoochee, and thru the Etowah Power Company, personally identified with itself, it owns four other sites on the headwaters of the Coosa River. C. Elmer Smith is vice-president.

Chattanooga and Tennessee River Power Company, in process of construction at Hale Bar on the Tennessee River, below Chattanooga, in co-operation with the War Department, by which the Government obtains slack-water navigation. The company in return receives ownership of the power of 58,000 horse power to be installed. This company is being personally financed by A. N. Brady, of New York, a director of the Westinghouse Electric and Manufacturing Company. Mr. Brady is also a director of the American Tobacco Company, whose interests control the Southern Power Company.

Northern Colorado Power Company, which has a stream development at Lafayette, Colo., and is projecting power plants on the Platte, has John F. Wallace and George C. Smith on its directorate (Westinghouse).

Nor do these two great concentrations completely tell the story. The Gould interests located in Virginia already own a controlling interest in undeveloped power sites on the James, Appomattox and Rappahannock rivers. The Southern Power Company, the largest operating power company in the South, supplies 110 cotton mills and other factories in 28 towns in North and South Carolina. Messrs. B. N. Duke, J. B. Duke and Junius Parker, of the American Tobacco Company, are officers and directors.

Stone & Webster, of Boston, own and control powers and sites in Florida, Georgia, Minnesota and Wisconsin, and in the Puget Sound region, with a total capacity of 150,000 horse power.

The Hudson River Electric Power Company, with its subsidiary companies, controls 75,000 horse power, developed and undeveloped. To within a year, C. Elmer Smith, of the Smith interests, and consequently of the Westinghouse group, was a director.

This list does not include other growing concentrations of power in New England and on the Pacific Coast, notably in Southern California, Western Nevada and Oregon.

To sum up, it is obvious that the ominous control of the developed water powers in the United States is trifling in its importance to the nation compared with the growing concentration in a few hands of title to undeveloped water-power sites. It must be borne in mind also that the power sites acquired by power companies are presumably the best sites. It is no secret that the most complete information regarding the undeveloped power resources of the United States, even upon the public lands themselves, is possessed, not by the Government, but by the corporations. Long before the underpaid Federal engineers had even begun a desultory study of the power situation, the picked and munificently paid employees of the power companies had instituted a systematic and searching study of the power possibilities of the public domain. It is significant that their investigations have not been confined merely to undeveloped sites, but that close upon the heels of the Government projects for the recla-

mation of arid lands follow the corporations, with propositions of contracts looking to the complete monopoly of the power possibilities created thru the construction of the Government reservoirs and dams.

The existence of this growing monopoly was keenly realized by ex-President Roosevelt. His position, briefly stated, was as follows:

The public domain contains power sites which belong to the people and which are rapidly passing into corporate ownership. That these power sites must be developed in the interests of all the people is plain. The West needs power, and the only great source of power not yet fully developed is water power. In order that the water powers not yet developed may be saved for legitimate use and from unregulated use, it is necessary to stop the theft of them until Congress has time to enact the necessary legislation. This should provide that power sites on the public domain may be leased under contracts which insure the protection of the public interest in their use.

Consequently, one of the last acts of Mr. Roosevelt as President was to withdraw from all forms of settlement and entry that portion of the unappropriated public domain which contains the more important sites for the development of water power. These withdrawals aggregated largely in excess of 1,000,000 acres. The purpose for which they were made is still further shown by the following quotation from the report of Mr. Garfield as Secretary of the Interior for the year 1908:

"The movement for the conservation of our natural resources shows that the people of the United States have fully awakened to the vital necessity of caring for what is left of the public domain. Conservation means not only the preservation of our resources, but as well their wise and immediate use, and the prevention of their misuse, whether by way of waste or monopolistic and speculative control.

"* * * If there be no power to affirmatively provide for the ultimate use or disposition of the public domain in accordance with the needs of the public welfare, it is the duty of the Executive to temporarily prevent its acquisition until Congress may have the opportunity to consider the question and adopt appropriate legislation."

In the same report Secretary Garfield criticised existing right-of-way laws,

under which power sites are acquired, and specified the character of legislation needed to protect the public interest and to afford investors proper security. His language was as follows:

"The right-of-way laws are neither equitable, certain, nor just. Some of these laws give everything to the grantee without protecting the people's interests. Others fail absolutely to give the grantees that business security which must be the foundation for great development. Another class is so uncertain in wording that it cannot be administered without friction. All right-of-way laws should be codified and revised so that they will be just, reasonable, and certain. The grantees should have security against revocation, except because of non-use or misuse, and a sufficient period of enjoyment, so that they can afford to spend the necessary money for development. The people's interests should be protected by provision for the return of the grant to their control at some reasonable time in the future, in order that it may be disposed of again according to the demands of the public welfare at that time. The best public interest also demands that the right-of-way laws provide a definite and speedy procedure for the revocation of rights of way because of willful and continued non-use or misuse."

Eight bills were introduced in the Sixtieth Congress which in one form or another met the demands of the power companies, by making it easy for them to secure power sites on the public domain in perpetuity, without compensation to the people, and wholly free from Federal control. Every one of these bills violated the policy of the Government, repeatedly outlined by President Roosevelt and now applied by the Forest Service within national forests. The bills and their authors were as follows:

Senate Bills

- No. 132—Heyburn.
- No. 435—Fulton.
- No. 2661—Crane.
- No. 4000—Guggenheim.
- No. 6626—Teller.

House Bills.

- No. 212—Howell.
- No. 3007—Bonyng.
- No. 11350—Mondell.

None of these bills became law. It is significant that their authors are among the most vehement opposers of the Roosevelt conservation policies. It is also significant that after Mr. Ballinger became Secretary of the Interior, Senator Heyburn and Representative Mondell were two of the first to write Mr. Ballinger, complaining that the withdrawals of power sites by President

Roosevelt were illegal. During March, 1909, Secretary Ballinger wrote Senator Heyburn in reply to his criticism, that the question of the legality of these withdrawals would soon be determined by him in conjunction with the Attorney-General.

Secretary Ballinger then called upon Director Newell, of the Reclamation Service, who had originally recommended the withdrawals, for an explanation of their legality. But before a reply had been received from Mr. Newell, and without any decision upon the subject by the Attorney-General, Secretary Ballinger began to revoke the withdrawals made under President Roosevelt by Secretary Garfield. These revocations continued until two-thirds of the area withdrawn had been restored. Then, after a conference with the President, Secretary Ballinger first discovered that it was legal for him to withdraw power sites. This he proceeded to do, with some deliberation at first, but within the last few weeks with an eagerness and a freedom equaled only by that of Secretary Garfield.

It is significant again that, altho Secretary Ballinger has alleged that the purpose of his power site withdrawals is to secure legislation, he has never either criticised the legislation suggested by his predecessor, or outlined a legal policy of his own.

To sum up, President Roosevelt took vigorous action in withdrawing power sites of enormous importance to the people, which, in view of the inadequacy of existing law, could in no other way be protected from unregulated corporate acquirement. Secretary Ballinger restored to entry two-thirds of these power sites, opening them to unregulated acquisition by corporations and individuals. He then so far changed his mind as to withdraw a portion of that which he had released, on information no more definite than that on which the original withdrawals by President Roosevelt were made. Whether power sites were lost to the people and gained by the interests, or to what extent, as the result of Mr. Ballinger's exceedingly deliberate action in ascertaining his own powers under the law, has not yet been fully ascertained. It is generally under-

stood that Mr. Myron T. Herrick, of Cleveland, Ohio, suggested at least one of Secretary Ballinger's restorations of power sites in Montana. Mr. Herrick's suggestion was warmly followed by that of Senator Carter, of Montana.

So much for the first charge. The facts regarding the second charge are these:

During the Roosevelt administration, under the spur of Secretary Garfield, the General Land Office partially investigated coal claims in Alaska, involving about 900 entries and 140,000 acres of land, containing a deposit of 1,500,000,000 long tons of coal. One of the groups of these coal claims was known as the Cunningham group, covering 5,200 acres, near Katalla, and containing about 63,000,000 long tons of coal, a large amount of timber, and waterfalls which furnish 4,000 horse power available for mining and other purposes. Facts now available show that these coal claims were inspired by the Guggenheim syndicate, into whose hands the claims would have passed. This syndicate owns copper mines of enormous value in Alaska, and it already controls the transportation companies on land and water, the terminals and the wharves. Only the coal was needed to make the monopoly complete.

Labor conditions at present prevent the mining and shipping of the Alaskan coal covered by these fraudulent locations, but when the Panama Canal is completed, labor and transportation conditions will be so modified that the coal will be available on the Atlantic as well as on the Pacific Coast. The proposed monopoly, therefore, involves the future coal supply of the whole country, and presents the last opportunity of the people to regulate that supply.

Mr. Ballinger, while Commissioner of the General Land Office, displaced a former special agent from the control of these cases and placed them in the hands of Chief of Field Division L. R. Glavis. Before Mr. Glavis's investigation was fairly begun, the claims were, with the approval of Commissioner Ballinger, clear-listed for patent upon the report of the former special agent. In consequence of a protest from Glavis, Secretary Garfield required Commis-

sioner Ballinger to suspend the issue of patent upon the claims and continue the investigation. After this suspension, Commissioner Ballinger appeared before a committee of Congress and alleged that the charges against the claims were only "technical," and advocated legislation to authorize the issuance of patent for them. A little later, Senator Heyburn introduced a bill, which fortunately failed of passage. Had it passed, it would have required the patenting of the Cunningham and other coal claims. Secretary Garfield made an adverse report upon this bill, and called attention to the fact that its passage would validate many claims initiated thru "dummy" entrymen and thru conspiracy to defraud the United States.

One person could at that time, under the law, locate and enter not more than 160 acres of coal land in Alaska. To avoid this provision of the law and to control a large body of coal land, several men went to the laboring camps of the Great Northern Railway, near Seattle, and to the docks at Seattle, and secured powers of attorney from laborers having no knowledge of Alaska coal lands and no money with which to purchase them. These laborers, also, at the same time, gave powers of attorney to the individuals referred to, authorizing them to sell the land so located. Perhaps the laborers received some infinitesimal consideration. The controlling individuals afterward, acting under the powers of attorney, substituted the names of responsible persons who either represented them or paid a valuable consideration for an interest in the locations. These locations, so located by "dummy" entrymen, were then consolidated into a corporation, according to the original intention of the controlling individuals.

This system was followed in the Cunningham and other Alaskan coal claims involved in the investigations above referred to, and ordered by Secretary Garfield.

Congress adopted Secretary Garfield's views, and enacted the law of May 28, 1908, which allowed the consolidation of legal claims to certain well-defined limits, but subject to an anti-trust clause, which was also suggested by Mr. Gar-

field. Notwithstanding this action, the General Land Office suspended the investigation by Glavis during the summer of 1908, and until October of that year. The examination then proceeded without unusual features until six days after Mr. Ballinger's induction into office as Secretary of the Interior. Upon resigning as Commissioner of the General Land Office, Mr. Ballinger had become attorney for the claimants to the Cunningham and other Alaska coal claims.

Secretary Garfield, Commissioner Dennett and Chief of Field Service Schwartz appeared on January 30, 1909, before a select committee of the Committee on Appropriations of the House of Representatives, and testified concerning alleged fraudulent land claims pending before the Department of the Interior for action. Among the claims discussed were the Cunningham group. Secretary Garfield expressed himself as positive that the act of 1908 did not validate these claims or permit their consolidation, and stated that the evidence developed by the investigation then in progress convinced him that the claims were illegal and fraudulent.

Mr. Garfield's views were indorsed by Mr. Schwartz, who also outlined the plan which had been followed by the claimants to perpetrate the fraud. Mr. Schwartz based his opinion upon the reports of Chief of Field Division Glavis, to whom he referred as "one of our most conservative and careful men."

Mr. Dennett's testimony concerning the claims was evasive, but clearly friendly toward them.

Almost immediately after Mr. Ballinger became Secretary of the Interior, the General Land Office began to urge Glavis to make an immediate report on the Cunningham claims. On May 19, Assistant Secretary Pierce rendered a decision declaring that charges of conspiracy would not lie against the Alaska coal claims because of the act of 1908, and ordered the clear-listing and patenting of claims of a character described by him in terms which clearly included the Cunningham group. Glavis was immediately directed to make a report in accordance with this decision, but before further action by the General Land Office, the Attorney-General, on June 12,

1909, made a decision overruling Secretary Thorne on every point. In consequence it was necessary for the controversy over the claims to proceed to a decision.

The General Land Office again began urging Glavis to take immediate action, with a view to a hearing on the cases. Glavis explained that the evidence was not legally complete, and that if an immediate hearing was ordered he would be compelled to rely to a considerable extent on the testimony of the claimants themselves. He urged a delay of thirty to sixty days in order to collect independent evidence. Not only were his protests overruled, but an agent from another district was sent to take charge of the cases, and Glavis was censured as "insubordinate." Action unprecedented in the history of public land practice had already been taken, by ordering the hearings held before a traveling commissioner, and the collection of evidence while the hearings were in progress.

Then, for the first time, Glavis called upon the Forestry Service for assistance. That Service was hitherto wholly uninformed of plans for an immediate hearing, altho half the claims are within the Chugach National Forest.

A request by the Forest Service for temporary delay to ascertain the necessity for field investigation within the Chugach National Forest was unanswered. Only when an emphatic request for suspension of the proposed hearings was made by the Secretary of Agriculture did the Department of the Interior vouchsafe a reply.

It was toward the end of August that Chief of Field Division Glavis, by laying the case before the President, precipitated the storm which had been brewing since March 4.

Here the case rests. To sum up, more than a billion dollars worth of coal belonging to the American people has, since March 4, been in grave danger of passing illegally into corporate hands. The record, so far as it is obtainable, does not show that the official actions of the Department of the Interior have lessened this danger, but that they have created it. Under Secretary Garfield these coal claims were passing unswervingly in the direction of cancellation. Under Secretary Ballinger they were passing unswervingly into corporate hands. Here again the case rests.

In the Oregon land fraud cases, so recently a matter of public scandal, it was alleged that high officials had conspired to create national forests, or forest reserves, as they were then called, to allow railroad companies and other large holders of land to exchange denuded and worthless land for valuable timbered land. It was only after the corporations had traded nearly all of their worthless land that the law allowing the exchange was repealed. The present Administration is presented with the opportunity to stop the Alaska coal land frauds before their perfection and before the Government has lost its property. It is also presented with the opportunity of securing right-of-way laws which will prevent the completion of the power monopoly. Ex-President Roosevelt labored vigorously to secure such right-of-way laws, but as stated in his veto of April 13, 1908, of the James River Dam Bill, his efforts were frustrated by "lobby" of the power companies before Congress. All friends of that Administration hope to see the present Administration finish the good work begun by President Roosevelt.

WASHINGTON, D. C.

Literature

The Catholic Encyclopedia

THE fifth volume of *The Catholic Encyclopedia** lies before us, fortified—if that be an appropriate word—by the “*Nihil obstat*” of a diocesan censor and the “*Imprimatur*” of the Archbishop of New York. We wish well to this great undertaking and would be pleased to say that it fulfils the exacting requirements of modern scholarship. But what can a candid critic do but despair when important articles like “Esther,” “Elijah,” “Elisha,” “Ecclesiastes,” “Divination,” and “Eucharist” are assigned to writers whose incompetence fairly takes one’s breath away? The writer of the paper on “Ecclesiastes” not only maintains a unitary authorship of that book—Solomon’s namely—but attributes to this author a mysticism hardly less spiritual than that of Thomas à Kempis. The studies of “Elijah” and “Elisha” are little more than paraphrases of the biblical narrative, without even an attempt at criticism, or a reference to modern scholarship concerning these prophets. And the immense importance of Elijah in late Jewish apocalyptic literature—a point which throws no little light on the story of the Transfiguration—is absolutely ignored. As to the article on “Esther,” one could endure the author’s maintaining that this book is historical even “in detail”; but how can a scientific biblical student characterize the astounding assertion that it is the “more generally accepted opinion among contemporary critics,” “that the work is substantially historical?” The articles on “Divination,” “Exorcism,” and “Discernment of Spirits” take but little cognizance of comparative religion and none at all of modern psychology. Likewise the essay on “Spiritual Direction”—a topic which serves its Jesuit author for a pretense to attack Americanism—is destitute of any reflection upon the character-aspect of spiritual direction, and contains not a word of warning as to the parasitic type

of man, or more probably woman, that the classic species of spiritual direction is only too likely to produce. The subject of the “Eucharist”—certainly the most important in this volume—is dealt with in the old-fashioned manner in which theologians like Bossuet or Bishop Milner would have treated it. Of the immense work of recent criticism on the Lord’s Supper there is not a trace. In robust disregard of criticism the author drives thru patristic history with the statement that, from the “*Didachè*” on, the Fathers—Augustine being only an apparent exception—bear illustrious witness to the Church’s present dogma; and with the accessory statement that thru all Christian history up to the ninth century there is no trace of controversy concerning the Real Presence. It is astonishing that he could have made the former statement if he has ever read the “*Didachè*,” and impossible that he could have perpetrated the latter if he had gone thru the work of the Catholic Batiffol, wherein he would have found proofs of very serious differences about the Eucharist many centuries before the ninth.

A marvelous instance of theological reasoning is to be found in the article on “Divorce.” There we are told that marriage, by the law of nature, is intrinsically indissoluble. Yet a few lines later we read that the Almighty Author of the law of nature inspired Moses to enact the very lax system of divorce which prevailed among the Jews. Not less startling in this series of incoherences is the assertion that the Pope himself can dissolve the intrinsically indissoluble marriages of the unbaptized. Something uglier than incompetence lies in a declaration in the article on “Dupanloup,” to the effect that the anti-Infallibilists at the Vatican Council “for political reasons” “stood if not against papal infallibility, at least against the opportuneness of the definition.” With Hefele, Kenrick, Dollinger, and the schismatic Church of the Old Catholics before one’s eyes it requires unusual charity to

attribute to the writer of such a statement nothing worse than ignorance. Let us conclude with grateful acknowledgments to Dr. Gibot for his calm, competent study of Ecclesiasticus; to Dom Chapman for his studies in early Church history; and to Dr. Hyvernât for his sketch of Coptic literature. These men and one or two others give us glimpses of fair and comprehensive scholarship which are as refreshing and nearly as far apart as oases in the Sahara.

Railroad Freight Rates. By Logan G. McPherson. New York: Henry Holt and Co. \$2.25.

Mr. McPherson has made railroading a life study and is received at our great universities as an authority on that subject. This exhaustive volume contains the first thoro analysis of freight rate schedules, an analysis which explains if it does not excuse much seeming absurdity and injustice in railroad charges. Tho a merchant who pays more for a short haul than his rival for a long haul may not be reconciled to ruin by the proof that the railroad makes the lower charge to his competitor not at all out of love for that competitor but purely to meet water competition, yet he may see that the railroad is as much under economic pressure as he himself. The independent firm that howled against the enormities of the rebates which fattened big corporations may be consoled with the proof that railroad managers, at least those who were honest, reprobated rebates and discriminations and now join in jubilation over their diminution—a diminution which some recent court records show to be a little farther from disappearance than this author believes. Housewives, it seems, have little direct interest in railroad rates; for free carriage would not appreciably affect food prices. A cent a dozen on eggs, a cent a pound for butter, a cent and three-quarters a pound on turkeys, half a cent on a three-pound can of tomatoes and four cents on a pair of shoes—the actual charges for freight—do not account for big family budgets; tho \$10 a thousand feet for the carriage of lumber and over a dollar a ton on coal do make a difference. Mr. McPherson's conclusion is that while public complaints of favoritism, injustice and management for Wall

Street purposes have in some instances been justified, yet today reform has been so thoro, extension and improvement of the roads are so urgent and will cost so much (an annual average of \$900,000,000 for the next decade), present capitalization is so close to actual values and returns are so much less than on capital invested in manufactures and agriculture that all patriots should echo the cry: "Let us have peace." So long as nearly every State has a Railroad Commission which is in league with the Federal Interstate Commerce Commission the citizen can enjoy peace with security. Private ownership is incompatible with public management, as the author argues; but public management is more likely to lead on to public ownership than to retreat in favor of old-style private management.

Artemision; Idylls and Songs. By Maurice Hewlett. New York: Charles Scribner's Sons. \$1.

The nucleus of Mr. Hewlett's volume consists of three long poems of Artemis, the stiller of passion—"Leto's Child," "The Niobids" and "Latmos." Around these are grouped a number of shorter verses on the same general subject, a few of which have been published before. The effect of these classic topics as treated in Mr. Hewlett's peculiar romantic and neo-renaissance vein, with a good deal of rhythmical *insouciance*, genuine or affected, is distinctly curious. It is like looking at a clear landscape thru colored glasses—a brilliant and prismatic spectacle, no doubt, but one singularly anomalous and out of character.

From Darkness to Light. By Mary Helm. New York: Plume (H. Knopf Co.). 84c.

The author of this volume is the daughter of the war-time Governor of Kentucky, and recognized for the last ten years as one of the most able editors connected with Southern Methodist journalism. As editor of *Our Homes* she had been one of the leaders in home mission work. There is not a word in this volume expressive of prejudice, ill-will or sectional narrowness which almost invariably shows in a book on the negro question whether the author is Northern or Southern. The faults of both sections are set down with that fine, blue-veined

veracity that is as delicate an expression of intellectual honesty and courage as can be found anywhere. The author covers the whole period of negro evolution in this country with an initial chapter on his savage state in Africa, showing its effects upon his growth and development here. But the book is more than a compendium of carefully gathered information; it is like the fair kind hand of a wise and good woman, held out in compassionate helpfulness to the negroes themselves. "All my life I have lived close to, and loved many of the race. And I have thought of them as men and women made of God for his glory, not as a 'problem.'" And for this reason what she has written contains an element of truthfulness not to be found in the treatise of a mere economist. She has dedicated the volume "To my faithful old nurse, Aunt Gilly . . . with tender love and grateful memories." And while it is intended as a text-book for the Home Mission study course, we recommend it to our readers as a memorial of their trials, sorrows and sufferings that should soften bitterness, stimulate hope, and friendliness between them and the whites.

Literary Notes of Forthcoming Books

....What the coming book publishing season will bring forth qualitatively is, of course, largely a question that time alone can solve. Quantitatively the early lists of announcements already sent out show that of the making of many books there will certainly be no end, much less a diminution, until the first of the coming year. A complete survey of these serried ranks is out of the question; what is attempted in the brief notes that follow is to acquaint the reader with the titles of the forthcoming books by well-known authors, and with those of books whose choice of subject demands that attention be directed to them, irrespective of their authorship, whatever facts are now available being added for the guidance of those interested. Opinions will be given in these columns as the books themselves begin to appear. The immediate future may bring forth a new writer of exceptional talent, of genius even (his book may be already in print, waiting to be launched), but he will have to bide his time. So far as the announcements go now, two general observations may be made. One is the continued neglect of poetry by our publishers, undoubtedly because no poet of promise has yet been found, for our best publishers are always willing to encourage true talent, even when there "is no money in it,"

only the *cudos* of discovering it. The second observation is a safe prophecy: that the main interest of the public in literature, this fall, will not be belletristic; the North Pole and aerial navigation will claim first and widest attention.

ART.

....The Dutch schools of painting, old and modern, have been so much to the fore in English and American sales this year, that two works on the subject may well be called timely: *The Story of Dutch Painting*, by Charles H. Caffin (Century Company) and *Dutch Art in the Nineteenth Century*, by G. H. Marius, translated by A. Teixeira de Mattos (Lippincott). The same firm announces another art work of the hour in *Manet and the French Impressionists*, for the leader, at least, if not the school itself, has won his way with us. French art will also be represented in *Corot*, by Everard Meynell (Wessels). A welcome work on *The Art of the Metropolitan Museum*, New York, by Ernest Knauff, is promised for an early date (Page). The second volume of the late Russell Sturgis's *History of Architecture*, which he had practically completed at the time of his death, is to be issued soon (Baker & Taylor). The twelfth volume of the Connoisseurs' Library will be *Illuminated Manuscripts*, by J. A. Herbert and Evelyn Underhill (Putnam).

BELLES-LETTRES, ESSAYS, ETC.

....First place in this department must be given to *Emerson's Journals*, now published for the first time, and edited by Edward W. Emerson and Waldo Emerson Forbes (Houghton-Mifflin). A companion volume to Mr. W. C. Brownell's "Victorian Prose Masters" will be his *American Prose Masters* (Scribner), dealing with Cooper, Hawthorne, Emerson, Lowell, and Henry James. The mere announcement of a new book by the prince of our living critics will certainly suffice. In connection with the publication of an English translation of the works of Anatole France, the announcement of George Brandes's study of the French master in English dress will be widely welcomed (Doubleday-Page). *The Life of Paul Verlaine*, by E. Lepelletier, is announced as by "one who knew him intimately all his life, lent him money, procured him employment and found publishers for his poems" (Duffield). *Richard Jefferies: His Life and Work*, by Edward Thomas, which has been well received in England, will have an American edition (Little-Brown). *The Letters of Percy Bysshe Shelley*, some 450 in number, collected and edited by Percy Bysshe Shelley, will bear the imprint of the Scribners. This, we are informed, is unquestionably the most important contribution to Shelley literature made in the last forty years. *A History of French Literature*, from its earliest beginnings to Rostand's "Chanticleer," by Annie Lemp Konta, is a work for the general reader as well as the student (Appleton).

PROSE POETRY

The President's post. A volume of *Recollections of George Washington*, by George F. Parker, written with the approval of its sub-

ject, is to appear next month (Century). The diary of James K. Polk, being his own record of his conduct of the Presidency, begun in August, 1845, and continued to within six weeks of his death, is announced by McClurg, who have also in preparation *Something of Men I Have Known*, by former Vice-President Adlai E. Stevenson, and *Stephen A. Douglas*, by Clark E. Carr. Of importance in this year of exploration is the *Autobiography of Henry M. Stanley*, edited by Lady Stanley (Houghton-Mifflin). The venerable John Bigelow has written his *Retrospections of an Active Life* (Baker & Taylor). The *Home Letters of General Sherman* have been edited by M. A. De Wolfe Howe (Scribner). A—no, not a—*The Life of Mary G. Baker Eddy and the History of Christian Science* are told "with the historian's purpose of accuracy" by Georgine Milmine (Doubleday-Page). Lord Broughton's *Recollections of a Long Life* have been edited by his daughter (Scribner). Rear-Admiral Robley D. Evans will supplement his "Sailor's Log" with *An Admiral's Log* (Appleton). A *Memoir of the Rt. Hon. William Edward Hartpole Lecky* has been prepared by his widow (Longmans-Green).

FICTION.

....From the usual long list, the following first selection is made: *John Marvel's Assistant*, by Thomas Nelson Page, a story of the South and the Middle West, dealing with present-day social conditions and unrest and socialistic theories as they appeal to idealists of all creeds, but propounding no theory and teaching no lesson except that of charity and helpfulness (Scribner). *Susanna and Sue*, by Kate Douglas Wiggin, a story in the "Birds' Christmas Carol" manner, whose little heroine comes under the influence of the Quaker atmosphere (Houghton-Mifflin). *Trespass*, by Mrs. Henry Dudeney (Small-Maynard) is another of her tales of rural English life and character, and of wider human nature. In *The Knock at the Door* (Lippincott), Robert Hichens returns to Africa for his background and local color; a new novel by Sir Gilbert Parker remains as yet unnamed. It will be published by the Harpers, who announce also Hamlin Garland's *Mocassin Ranch*. Elizabeth Robins's *The Florentine Frame* will bear the imprint of Moffat, Yard & Co. A Dutch novel, Israel Quenda's *Tall of Man*, has been translated and will be published here by the Putnam. Its author began life as a boy in a diamond cutting establishment, and is the literary critic of the leading paper of the Netherlands. The preliminary announcement states that he is "nearer Balzac than any other living novelist." *YOUNG YERMS*. Another Dutch novelist, an old favorite of ours, Maarten Maartens, will give us *The Price of Doris Lis* (Appleton). *Diamonds and Pearls*, by the Castles, has been running as a serial in an American periodical, and is in their usual, agreeable, well-calculated manner (Dodd-Mead). Gilbert Russell's *Early Mechanics*, an *Elle et Il* should be the so-called "Elle et Il" full of the most interesting questions with scenes laid in London, New York, San Francisco and Boston (Stokes). *The Pool of Flame* is the promising

title of the new book of the ingenious Mr. Louis Joseph Vance (Dodd-Mead), whose father, by the way, has turned author on his own account with *Big John Baldwin*, a historical novel whose hero is first a soldier under Cromwell and then a settler in Virginia (Holt). E. Phillips Oppenheim's new book, *Jean of the Marshes*, will no doubt be in his familiar entertaining vein (Little-Brown). Another clever inventor of romance, tho in a different manner, Mr. H. B. Marriott Watson, will publish thru the same Boston house *The Castle by the Sea*. One of our important native authors, Mr. Robert Herrick, will give us another of his suggestive, thoughtful studies of our social existence in *A Life for a Life* (Macmillan), other novels announced by this firm being Jack London's *Martin Eden*, Marion Crawford's last book, *Stradella*, and a new volume by Zona Gale.

HISTORY, BIOGRAPHY, ETC.

....Mr. John Bach MacMaster's *History of the People of the United States*, from the close of the War for Independence to the opening of the Civil War, will reach the year 1852 and its seventh volume this autumn. An eighth volume will complete this fascinating work (Appleton). In *The Relations of the United States with Spain* Rear-Admiral F. E. Chadwick will trace the diplomatic intercourse between the two Powers from the earliest days to the incidents that led to the Spanish War (Scribner), a subsequent volume to be devoted by him to that war itself. Since diplomacy is here touched upon it will be well to mention *American Foreign Policy*, by "A Diplomatist" (Houghton-Mifflin), an examination of the world's present diplomatic situation, of the part played in it by the United States, and of the policy we should pursue for the future. The author, we are informed, is "one of the most brilliant" of our diplomats, Mr. Hubert Bruce Fuller A. M., LL. M., traces in *The Speaker of the House* the genesis of the office and the gradual development of the power of the Speaker of the House of Representatives, giving sketches of the great incumbents of the office from Frederick Muhlenberg to "Uncle Joe" Cannon (Little-Brown). The *Speeches and Addresses of Henry Cabot Lodge 1884-1909*, are to come to us from Houghton-Mifflin Company. The *Speeches of William Jennings Bryan* will bear the imprint of Funk & Wagnalls. One wonders how two duodecimo volumes can possibly be made to contain them. A timely work that derives weight and standing from its authorship is the veteran British diplomat Sir Horace Rumbold's *Francis Joseph and His Times*, brought down to the recent sensational events in the Balkans (Appleton).

MUSIC.

....Sir Hubert Parry's *Life of John Sebastian Bach*, first promised last fall, will appear this season, the most important of the works in this field (Putnam). Mr. Henry T. Finck, music editor of the *New York Evening Post*, will give some *Success in Music and How It Is Won*, a scrapbook in which the world's greatest singers, pianists, violinists, and teachers tell the secret of their success (Scribner). One

of the greatest winners of success in this field. *Melba*, will be the subject of a biography by Agnes C. Murphy (Doubleday Page). *Musik: Its Laws and Evolution*, by Jules Combarieu, of the Collège de France, translated by Joseph Skellen, is announced by Appleton. And rejoice, ye who have struggled with the "English words" of the "libretto of the opera"; Richard Le Gallienne has made a metrical translation of Wagner's text for "Tristan und Isolde" (Stokes). Let us hope that he will undertake the task for the other Wagner operas as well!

TRAVEL, EXPLORATION.

... With, undoubtedly, the yet unwritten narratives of Peary and Cook in prospect before the end of the season, the most important work of exploration already announced is Lieutenant Shackleton's *Antarctic Voyage*, in which Siberian ponies were employed instead of Eskimo dogs, and even the motor car. The English explorer was uncommonly successful with his photographs, of which 300 will be reproduced; and he and his party passed through enough peril and adventure to give the necessary popular leaven to the account of his scientific discoveries (Lippincott). Another event in the publishing world still lies hidden in an indefinite future: the story of our distinguished faunal naturalist. An impatient continent will be appeased meanwhile by the beginning of publication of parts of his account of his prowess and its results in one of the magazines. More is coming to heighten our enjoyment of the wood fire in the months to come with narratives of hardship and daring and their reward; Sven Hedin will tell in *Trans-Himalaya: Discoveries and Adventures in Tibet* of his successful effort to force his way into the Forbidden City. It is too much to hope that the publication of the Duke of the Abruzzi's account of his latest exploit—the highest altitude yet reached—may also fall within the limits of this publishing season of strenuous victories. Dr. Wilfred T. Grenfell's *Labrador* demands inclusion here (Macmillan). *The Great Wall of China*, by Dr. William Edgar Geil, we are told, will contain much that is new and startling—information concerning a race of hairy mountain dwarfs, and the fact that not one but a dozen great walls have been built by the Chinese (Sturgis & Walton).

SOCIOLOGY, ECONOMICS.

... A few titles only, sufficiently important to furnish serious reading matter for some time to come. Mr. Booker T. Washington has written *The Story of the Negro*, a survey of the African's adventures and rise since he was first brought to this continent. The narrative begins, properly enough, in Africa; it deals with the first slaves, with the long struggle for emancipation, and closes with chapters on the negro as schoolmaster, farmer, business man and banker; in fact, the book is a record of its author's own life and work, with a look into the future (Doubleday-Page). Mr. J. O. Fagan, whose "Confessions of a Railroad Signman" made enough of an impression, in-

deed, to secure a vivid interest in whatever he may have to say further on the subject, will give us *Labor and the Railroad*, a description and analysis of labor conditions today, outspoken and thoro (Houghton-Mifflin). From this firm we are to have also a work by Prof. Albert Bernhardt Faust on *The German Element in the United States*, from the coming of the earliest immigrants to the present day, with a survey of the part they have taken in the westward movement of this nation, and in its wars. The author makes a searching analysis of the influence of the German element in our American civilization, and traces in the most interesting way the influence of the Germans on the material development of our country in both agriculture and manufacture, upon our political institutions, education and social life, and music, literature, and the drama. A third work announced by the Boston house is Anna A. Rogers's *Why American Marriages Fail*, to which, at least until we have seen the book, we feel inclined to answer, "Do they?" We have already mentioned the *Documentary History of American Industrial Society*, by Professor Commons and others, the most comprehensive and authoritative work on the labor movement (Clark).

MISCELLANEOUS.

... Our friends the philosophers will continue to wage the battle over pragmatism. Prof. William James will answer his critics in *The Meaning of Truth: A Sequel to Pragmatism*, which will contain "all that has ever been written on the theory of knowledge," and form a full and definite expression of the pragmatic epistemology, so far as his share in it goes (Longmans-Green). Some time in November Prof. Albert Schinz is due with *Anti-Pragmatism* (Small-Maynard), which is really a sort of Balaam's curse. Prof. Cesare Lombroso will make his first contribution to metaphysics this fall in *After Death—What?*—a survey of the whole field of spiritistic phenomena from their first appearance in savage tribes and early civilized races down to his own and others' latest and most severely scientific laboratory experiments at Turin and Naples. Aerial navigation may become a sport; at present it has become a science with an indefinite future. How many books will be written on the subject cannot be foretold, but two new ones are announced, Prof. A. Lawrence Rotch's *The Conquest of the Air* (Moffatt-Yard), and *Aerial Navigation*, by Prof. Alfred F. Zahm, the latter a comprehensive history of aeronautics from military, recreative and scientific points of view, from the earliest dreams of wings and flying machines to the present perfection of practical air craft (Appleton). The Rev. W. S. Rainsford, a mighty hunter, indeed, will tell in *The Land of the Lion* of his hunting trip for big game on the Nzoia plateau in British East Africa, and of his observations of native life there (Doubleday-Page). A book on the Panama Canal, in which the human interest will predominate, is *The Conquest of the Isthmus*, by Hugh C. Weir (Putnam).

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
139 Fulton Street - - - New York

A WEEKLY MAGAZINE. FOUNDED IN 1848.

One Year, \$2.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, \$1.75 a year extra; to Canada, \$1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of *The Independent* are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with \$1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

The Rival Claimants to the Pole

WE still believe, and choose to believe, that both Dr. Cook and Commander Peary went to the Pole. No one questions that Commander Peary did. His word is taken for that. Unfortunately there are those, particularly the partisans of Peary, who recall that Dr. Cook's ascent of Mount McKinley was questioned because it depended on his own word. That doubt has thrown a shadow of doubt on his last claim. That he is an experienced and competent explorer the world knows, but the world is not quite certain that he might not lie. It is a harsh word, but that is the word they apply to him; and with the assertion of Commander Peary that Dr. Cook's two Eskimos deny that Dr. Cook went out of sight of land, we are all compelled for a while to reserve full assurance until he has presented his proofs.

It is a most disagreeable and ugly affair. The quarrels and jealousies of scientific men are notorious. Each wants precedence for his discoveries, more anxious for fame than for the extension of knowledge. In this case Dr. Cook made his preparations with some secrecy, as Mr. Bradley tells in this issue of *THE*

INDEPENDENT, and made haste to reach the goal before his competitor. It is to his credit that he speaks warmly of Peary's success, but he can afford to, and Peary's success is a real confirmation, in a measure, of his own. He has not in any direct way attacked Peary, unless in defense of the charge that he had utilized Peary's stores. Then he makes the counter charge. The first charge against him is that he tried to snatch another's laurels.

Commander Peary's attitude toward Dr. Cook is less commendable. We can appreciate his disappointment at having the honor of his life's quest snatched from him by another, but that hardly justifies the haste with which, on the asserted word of the two Eskimos, he charges Dr. Cook with being an impostor. "I have him nailed," he telegraphs. If it is true that Dr. Cook has so grossly deceived a trustful world, no words of censure can be too strong, but Peary might well have left others to speak them.

The truth is sure to come out. It were mad folly to make so stupendous a claim falsely. The records will be most strictly investigated. The Eskimos will be cross-questioned by those who seek only the truth. If we must perforce make some reservations, we do not yet see reason to disbelieve. We regret much that, in the rivalry between the two papers for the rights of publication, the *Herald* has not made haste, as does the *Times*, to give the data we need. No records are given us as yet of days' journeys and observations to substantiate Dr. Cook's claims. The article by Mr. Bradley will considerably explain and support Dr. Cook's contention, while Commander Peary's swift dash removes a chief source of doubt. Our readers will observe that General Greely raises no question that Dr. Cook actually reached the Pole.

The ambition to do a grand, difficult task is most worthy of praise, and the desire to have one's achievements recognized and acknowledged is the "last infirmity of noble mind." But there is nothing noble when the desire to secure one's own recognition involves a readiness to pull down another's, or even an evident pleasure at a rival's defeat. In

this case there is honor enough for both if both deserve it. For both, and especially for Commander Peary, there has been long, persistent effort, against successive failures and much discouragement. His geographic discoveries, apart from this last triumph, count him as among the first of our geographers. His life's efforts have at last been crowned. He may rest content with his life's task done. Dr. Cook has worked long in the same field. He appears to have had more fortune, altho he came later to his ambition. Both have given glory to American enterprise. We greatly regret that this American glory should be dashed with jealousy and quarrel; we trust with nothing worse.

After Harriman?

AMONG the hundreds of reflections—moralizing and otherwise—which the death of Mr. Harriman calls forth, there are one or two which cannot pass into immediate forgetfulness with the shifting of newspaper headlines to newer sensations.

Mr. Harriman accomplished more than any one individual before him had achieved along constructive lines of railway development. Unlike most of the "great financiers," who have begun and ended their careers in the stock market, Mr. Harriman was intelligently interested in something beyond fortune making. The term Napoleonic could be applied to him more appropriately than to most of the great leaders of the business world. He had the positive instinct of the statesman and the constructive genius of the engineer. Whatever he did by way of redistributing the ownership of railway securities, he was never charged with having wrecked railway utilities. On the contrary, he aimed always to improve the material basis of railway values. He reconstructed roadways and substituted good for bad rolling stock. He was essentially a thrifty man in his care of the income-earning capital of the corporations under his control, as in the handling of his own estate.

Because of these character traits Mr. Harriman was, as all must admit, a creator of wealth, and not a mere juggler

with its ownership. It is probably not exaggeration to say that for every million dollars that he added to his private fortune he added at least four or five millions, possibly much more than that, to the total wealth of the United States. For, by rehabilitating the Union Pacific lines and building its new feeders thru rich territory, he did the initial work toward bringing into existence a

Copyright, 1903, by Paul Reubens, New York.
E. H. HARRIMAN.

new empire of farms and shops and mines.

And this was by no means all. He demonstrated on the great scale the economic importance of unity and correlation in the railway service of the United States. Since the days when President Hadley, then Professor of Political Economy at Yale, used to contribute to *THE INDEPENDENT* his far-seeing studies of the principles underlying the evolution of railway interests, all well-informed students of the subject have believed that consolidation and unification of railway systems in this country must go on, whatever interruptions of the

process might from time to time occur thru unwise legislation or business depressions. Mr. Harriman accomplished what others had foreseen and predicted. Temporarily some reaction and disintegration may follow his death, but it is certain that sooner or later complete unification will be achieved. The railway service will be, like the postal service, single and organic.

Will it then be the property of one master mind, the dominion of an individual genius? Will it be the property of millions of stockholders, managed by a group of master minds, and strictly regulated and controlled by the Federal Government? Will it be the property of the people of the United States, controlled by the Government and managed by appointed directors, or on the departmental plan, like the Post Office? So far as the business world is concerned, and so far as the economic and political interests of the American public are concerned, these are not only the great, but also the real questions which Mr. Harriman's life and death have left to be answered.

New York Democrats in Conference

THE conference of New York Democrats held in Saratoga last week was not a Tammany meeting. Indeed, it was intended to represent those Democrats who care more for principles than for profit. Many of the best Democrats in the country were there, and it is accordingly well to consider what they present to the Democrats of the country for their approval.

Their platform begins with the old Democratic principle of strict construction of the Constitution, and no extension of Federal power, no further centralization at Washington. This sounds well, but it is against the tendency of the age and the necessary development of the country. The States are no longer separate; they are bound together by the closest means of intercommunication, unthought of by the fathers. What was once local has now become general. We must cross State bounds. We cannot have any hard and fast rule forbidding new applications of the principle that

the welfare of the whole country is to be secured. There were rich men in control of this conference, and one of their purposes was to oppose the control by taxation of corporations by the Federal Government. But the central control of corporations has become a prime necessity, however much it is objected to by those who wish to dodge responsibility by selecting the State where they will be incorporated. This fear of centralization would also oppose a central national bank, now so much desired by many bankers.

Next the platform calls for a tariff for revenue only. That is a clear principle, which might find favor with some old Republicans. But will it find favor with Democrats? Certainly not with all, for Senator Aldrich has had all the Democratic help he wanted to maintain a heavy protective tariff. The rule which the conference and Mr. Bryan urge would drive out many Southern and some Northern Democrats.

Another plank is unworthy of the conference, if it means anything. It is that which demands "the abandonment at the earliest possible moment" of the Philippine Islands, but "first safeguarding their independence by a sufficient guarantee." That puts off the abandonment till after the Greek calends.

The election of United States Senators by direct vote of the people is well enough, but it is nothing to divide parties on, any more than is economy or prohibition of the sale of liquors. Another plank squints toward the primary system which Governor Hughes is supporting, and this is hardly a partisan question.

There is a plank favoring the constitutional amendment authorizing the levy of a Federal income tax, and then another saying that corporations should be taxed by the States alone. The two do not harmonize; in fact, they conflict, and the conference was plainly told so by Judge Herrick. Equally it conflicts with the plank opposing the centralization of power. This shows that there is not a little buncombe in denunciations of centralization and favoring strict construction. We all want to extend Federal power in one way or another. Democrats no less than Republicans.

With all criticisms, it was a useful and

important conference of the best elements in the party, and other States will take notice, and Tammany will take warning.

Self-Government and Calvinism

AMONG the topics discussed at the late Calvin Centenary in Geneva was the political influence on the State of self-government in the Church as conceived by the great reformer. An admirable paper by Prof. Paul Fredericq, of the University of Ghent, sets the facts in fair order. He writes as a historian, for he is not a theologian.

Self-government is not an invention of Calvinism. The republics of Greece and Rome antedate the Christian era. There were many communes in Europe in the Middle Ages. The republics of Italy and Flanders were especially flourishing. The citizens of Florence, Venice, Genoa, Milan, and the burghers of Ghent and Brussels met in the open air and governed their affairs by universal direct suffrage, as did the contemporaries of Pericles and the Gracchi. Later came the self-governing national organizations, with the English Parliament, the Cortès of Aragon and Castile, the Reichstag of the Holy German Empire and the States-General of France and the Netherlands.

But with the fifteenth century the great nations arose. Imperial centralization fostered absolutism in France under Charles VII and Louis XI, in Spain under Ferdinand and Isabella, in England under the Tudors, and in the Netherlands under the Dukes of Burgundy, while in Germany and Italy the great electors and the municipal dynasties tended to transform self-government into princely absolutism.

So when Luther rose against Rome absolutism had overcome nearly all popular barriers and suppress the rights of the people. Luther depended on the princes. He emancipated the conscience, but he preached the rights of the sovereign; and as a result wherever Lutheranism went, in Germany, Denmark, Sweden, Norway, it did not reduce monarchical rule, where it did not re-enforce it. It was the same with the Anglican Protestantism of England under

the Tudors, which allowed the Parliament to remain the subservient instrument of the Crown.

Calvin appeared at the very moment when self-government had nearly expired in Europe, and had preserved no refuge except in certain small and obscure Swiss cantons. He liberated the Church from the temporal power, and founded a religious organization purely self-governing and wholly free from the hierarchy. Every parish was a little republic which possessed universal suffrage and elected its own officers.

These men of various lands, who had learned the sweets of religious freedom, were not likely to submit long to political tyranny. The French Huguenots put a check on royal absolutism. Under William of Orange the Calvinists of Holland solemnly deposed Philip II, in the name of self-government and the States-General, declaring that the sovereign is made for the people, not the people for the sovereign. In Scotland John Knox, himself a scholar from Geneva, broke the rule of Queen Mary. We thus find at the end of the sixteenth century absolutism still in possession of all Catholic, Lutheran and Anglican Europe, while there remained three minor centers of political liberty, Switzerland, Holland and Scotland, which in the course of a few centuries were to teach their lesson to the whole civilized world.

From Scotland came the Puritans and Cromwell's Roundheads, who sent Charles I to the scaffold and established a republic in England. The Calvinist diplomacy of the Netherlands and the genius of William III of Orange, broke the absolutism of Louis XIV and definitely established the parliamentary government of England, which has remained the pattern for all other nations. It was these same Calvinists of England and Holland who transported self-government to America and founded the United States, to be followed by all the populations of the Continent.

But what of the new doctrine of liberty taught by the French philosophers and encyclopedists of the eighteenth century? Voltaire learned religious tolerance in England, where Montesquieu discovered parliamentarism. Rousseau was the "Citizen of Geneva." There he

received the strong imprint of Calvinism and carried to France his "Social Contract." La Fayette and Rochambeau, returning from our Revolutionary War, added their aid from lessons learned here. The French Revolution was an indirect product of Calvinism.

Thus, before the beginning of this century all the more or less civilized nations had accepted the doctrine of self-government, practised in its various degrees under a parliamentary government, but all denying the divine right of rulers, which Luther yielded, whether they call themselves republics or constitutional monarchies. It is mostly a matter of name. And in our century, under our eyes, we see the two lands which had remained faithful to absolutism, Russia and Turkey, coming to take a constitution and enter the general movement which now covers all Europe, both Americas, South Africa and the republics of Australia and New Zealand; and even Japan and the yellow race have yielded to the general contagion, and China promises a constitution in a few years, while India is in the ferment of threatened revolution if self-government is too long delayed.

M. Fredericq well says that perhaps historians have not attached sufficient importance to the influence of religions on the development or the restraint of political liberty. It is their religions that have lulled the nations to sleep, and religions that have wakened them up. "By their fruits shall ye know them."

Maeterlinck: Translator and Translated

The performance of "Macbeth" at Saint-Wandrille has a double interest. It introduces a novel form of the drama and it adds another to the many attempts to put Shakespeare into French. This select and household entertainment might be called "chamber pageantry," because it bears somewhat the same relation to the outdoor processions now so popular as chamber music does to orchestral. Most of the incongruities which Mr. Sanborn points out are not inherent in the plan, but due to the fact that "Macbeth" is not adapted to such a

setting any more than it is to the modern theater. Conceivably something more effective could be done in this line if a new play were written to fit the place and the conditions of enactment, requirements certainly not more exigent than those of the Elizabethan stage. In this it would even be possible to keep strictly to the three unities, and play the scenes appropriately indoors and out, in daylight and dark.

Madame Georgette Leblanc-Maeterlinck has been, as wives are apt to be, both a help and a hindrance to her husband. She has inspired some of his best work and also embroiled him in interminable controversies with theatrical managers. "Monna Vanna" was written for her, so, very naturally, she wanted a monopoly of the title rôle, and when Debussy set "Pelléas et Mélisande" to music as unearthly as the play, she insisted upon singing Mélisande. But the Parisian managers, either because they had *protégées* of their own or because they did not have a sufficiently high opinion of Madame Leblanc's capabilities as an actress and a prima donna, declined to take her, and M. Maeterlinck was not able to compel them to, or to prevent the production of the play and opera with other leading ladies.

But, at any rate, we owe to her assiduity, as Mr. Sanborn explains, a new translation of "Macbeth," which the London *Times* says "is the most conscientious effort to preserve the atmosphere of a Shakespearean play which has been attempted in French since M. Marcel Schwab's remarkable rendering of 'Hamlet.'" The difficulty of translating poetical language, wherein the sound and connotation of the words are as essential as their literal meaning, is admirably stated by M. Maeterlinck:

"The humble translators face to face with Shakespeare are like painters seated in front of the same forest, the same seas, on the same mountain. Each of them will make a different picture. And a translation is almost as much an *état d'âme* as is a landscape. Above, below, and all round the literal and literary sense of the primitive phrase floats a secret life which is all but impossible to catch, and which is, nevertheless, more important than the external life of the words and of the images. It is that secret life which it is important to understand and to reproduce as well as one can. Extreme prudence is required, since the

slightest false note, the smallest error, may destroy the illusion and destroy the beauty of the finest page. Such is the ideal of the conscientious translator. It excuses in advance every effort of the kind, even this one, which comes after so many others, and contributes to the common work merely the very modest aid of a few phrases which chance may now and then have favored."

He illustrates these variant views of the same landscape by bringing together all the different versions of a couplet, from Letourneur of the eighteenth century to Duval, the latest translator of Shakespeare:

"Strange things I have in head that will to hand

Which must be acted ere they may be scann'd."

"J'ai dans la tête d'étranges choses qui aboutiront à ma main; et qu'il faut accomplir avant qu'on les médite."—(Maeterlinck.)

"J'ai dans la tête d'étranges choses qui réclament ma main et veulent être exécutées avant d'être méditées."—(François-Victor Hugo.)

"Ma tête a des projets étranges qui réclament ma main; achevons l'acte avant d'y réfléchir."—(Maurice Pottecher.)

"J'ai dans la tête d'étranges choses qui passeront dans mes mains, des choses qu'il faut exécuter avant d'avoir le temps de les examiner."—(Guizot.)

"J'ai dans ma tête d'étranges choses que ma main exécutera, et qui veulent être accomplies sans me laisser le temps de les peser."—(Montégut.)

"Ma tête a des projets qu'exécutera ma main; je veux les accomplir de suite, sans me donner le temps de les examiner de trop près."—(Benjamin Laroche.)

"J'ai d'étranges projets en tête qui veulent être exécutés avant d'y réfléchir."—(Georges Duval.)

"J'ai dans la tête d'étranges projets, qui, de là, passeront dans mes mains; et il faut les exécuter avant qu'on puisse les pénétrer."—(Pierre Letourneur.)

This couplet is in itself an argument for more freedom of translation than is customarily allowed. The choice of "scann'd" from among other words that would have expressed the idea as well or better was obviously dictated by the necessity of riming with "hand" and this in turn was due to the desire to alliterate with "head." A translator if he is to make as good poetry as the original author must have an equal license. It is therefore not surprising to see that M. Maeterlinck has been most successful in preserving the spirit of the original where he has translated into rime instead of prose, for here the exactions of the French verse have forced him to a great-

er freedom. Here are fragments of the witches' songs:

Paddock crie, "Allez, allez."
Le laid est beau et le beau laid
Allons flotter dans la brume,
Allons faire le tour du monde,
Dans la brume el l'air immonde.

Trois fois le chat miaula
Le hérisson piaula.
Harpier crie "Voilà! voilà!"

Double, double, puis redouble,
Le feu chante au chaudron trouble.

In order that the reader may judge for himself whether the Belgian poet has succeeded in this effort to put Shakespeare into French, we quote a few passages of especial difficulty. The complete text is published in *Illustration* of August 28.

Et, enfin, ce Duncan fut si doux sur son trône, si pur dans sa puissance que ses vertues parleront comme d'angéliques trompettes contre le crime damné de son assassinat. Et la pitié, pareille à un nouveau-né chevauchant la tempête, ou à un cherubin céleste qui monte les coursiers invisibles de l'air, soufflerait l'acte horrible dans les yeux de tout homme jusqu'à noyer le vent parmi les larmes.

"Tu ne dormiras! Macbeth a tué le sommeil!" L'innocent sommeil, le sommeil qui dévide l'écheveau embrouillé des soucis.

Tout l'océan du grand Neptune pourrait-il laver ce sang de ma main? Non, c'est plutôt cette main qui empourprera les vagues innombrables, faisant de la mer verte un océan rouge.

Maeterlinck has himself suffered many things of many translators. Alfred Surtro has given us admirable versions of his philosophical works, "Wisdom and Destiny," "The Treasure of the Humble" and "The Life of the Bee," but his plays have not been so fortunate, for their emotional effect is dependent upon the maintenance of a peculiar atmosphere, so sensitive that a harsh breath will destroy it, leaving ridiculous wooden puppets where the moment before we thought we glimpsed beings of supernatural beauty. So even a reader whose French is feeble will prefer the plays in the original, for their language is of extreme simplicity and the effect may be even enhanced by the additional veil that his partial incomprehension draws across the stage picture. Then, too, Maeterlinck's trick of triple repetition which offends our Anglo-Saxon ears ceases to annoy us in French, for in that language even identical rimes are permissible.

As an example of how a prosaic liter-

alism may spoil the illusion let us take that exquisite passage which closes "Pel-léas et Mélisande," striking the keynote of its music and summing up its philosophy.

C'était un petit être si tranquille, si timide et si silencieux. C'était un pauvre petit être mystérieux, comme tout le monde. Elle est là, comme si elle était la grande soeur de son enfant.

This is the way it is rendered by Laurence Alma Tadema, and the libretto of the opera is still worse: •

It was a little gentle being, so quiet, so timid and so silent. It was a poor little mysterious being, like all the world. She lies there as if she were her own child's big sister.

The Division of Estates "O King, live forever!" was an ancient form of polite address, but we know very well that a new order was needed even after good King Arthur. It is usually personally sad to lose one's aged parents and friends, even when they have lost their full vigor, and we often hear the wish expressed that men did not have to decay and die. Why not be strong and live forever? The case of Mr. Harriman, dying at the premature age of sixty-one, may give pause to such complaints of the law of Nature. Before his mental powers had weakened, while still full of ambition, he had corraled a very large fraction of the railway wealth of the United States, and intended to secure more. There was no end to his ambition. His lines extended across the continent and across the Pacific Ocean, and reached southward into Mexico. Had he lived he would have added railroad to railroad, ocean line to ocean line, with no end to his plans. It is not a bad thing for the world that such ambitions should be shut down by death after a moderate number of years, and the property divided up among the heirs, and finally reach the community in general. It would be a fearful thing for one of our rich and grasping men to live forever. Nature knows her business. Even under Socialism a commanding genius, were strength and life unlimited, might get such influence as to be a curse to the community.

Collector Loeb's Inquisition

Those who have complained because Collector Loeb's inspectors examine them too closely, dig into their trunks too deeply and feel their pockets too faithfully as they land from a foreign trip, should not blame him, but blame the law. The tariff law requires him to collect the heavy duty on diamonds, laces and other costly objects, and hundreds of travelers try to cheat the Government. It is his duty to make careful inquisition. If smugglers can bring in diamonds and laces the honest merchants are injured. If the home-comers do not like to be searched let them find fault with those that make the law, not with those who faithfully execute it. If they do not want protection, let them seek some other way of getting a revenue, say by an income tax. We doubt if these disagreeable inquisitions will go on many years longer, for when we have hundreds of thousands of monoplanes and biplanes flying everywhere, the smugglers will beat the Congressmen, and the tariff for small, costly articles will have to go.

A Town Given Away

The friends of industrial education do not need to be encouraged just now, because everything is turning their way. We note, however, with special pleasure the gift of a whole town in Southern Missouri, to the Congregational Education Society, for the purpose of establishing a great industrial academy. The town of Grandin lies in a beautiful valley on the Little Black River. There are three hundred and fifty dwellings in the town, with a large hotel, a hospital, a bank, several boarding houses and stores and warehouses, with a public library, a gymnasium and three or four churches. All of these buildings, with all the land embraced in the town limits, and a large amount of farming land adjoining are granted by the Missouri Lumber and Mining Company, on the single condition that there shall be established a large, well-equipped academy for the industrial training of that class of young men required for forestry and mining, up to date. The lumber has been exploited

about this town, so it ceases to be a center of the most active operations of the company. They turn over the whole town and all of its institutions to those who can use them. The town is electrically lighted and the larger buildings heated with steam. There are artesian wells supplying an abundance of good water. There are two beautiful running streams, a splendid lake in the midst of a vast park of natural forest trees, and there are orchards of fruit trees and gardens everywhere. Industrialism is touching the hearts and the pockets of our great capitalists, so that we may look for more of this sort of generosity, to supplement the grant of lands and capital to our classical universities.

A Spartan Policy In his late little volume, "Hellas and Hesperia," Professor Gildersleeve quotes the Greek scholar, Dimitrius Bikélas, who complains of the American policy which deports sickly immigrants. The ancient Spartans used to throw into the ravine called Kaiadas all defective infants—a proceeding against which the eulogists of Christianity were wont to declaim with intense abhorrence. Analogous to this he thinks is the restriction of immigration to those who are physically fit for the work of life. There is something to be said on that side. Perhaps in our selfishness—or we might soften the word and call it *sese-ism*, just as philosophers have given the name *altruism* to unselfishness—we have not sufficiently considered the matter. Is it quite right to welcome a strong man and his wife to the country, who are a profit to us, and then to send back their child, who has sore eyes? Of course, we must deport criminals, or the insane, or those otherwise incompetent whom other governments might wish to dump on this country, but it is another thing with those in imperfect health, who are likely to be cared for by their relatives. Very unpleasant cases come frequently to public knowledge. Really, the law is too Spartan.

Rich Religious Corporations

The richest religious corporation in the United States is Trinity Church, New York, which got its millions of property by gift generations ago of a

farm which is now in the dense City of New York. In a similar way the First Presbyterian Church in Newark, N. J., has come to be one of the wealthiest churches in the country. It is not wholly an academical question whether it is not better that every generation should support its own religious work instead of depending on the bequests of the ancients. A prospective case is that of which we give the account from a respected Catholic contemporary:

"The Drexel estate will play havoc with us all one of these days," said an old pastor. The archdiocese will have so much wealth that it will not know what to do with it. Mr. Drexel, one of the city's wealthiest Catholic men, died some years ago and left his estate to his three daughters, with a proviso that in case they died without issue, all of it would go to Catholic institutions named in the will. There are about ten such institutions and the prospects are that in the course of a few years this immense estate, now valued at sixty million dollars, will revert to these institutions. Mother Catharine, who founded the Sister of the Blessed Sacrament, was one of the daughters. The other two are married, but have no children. Mother Catharine at present is devoting her large annual income to supporting schools for negroes and Indians thruout the West and South. She has made excellent use of her personal wealth and many institutions owe their existence to her zeal and charity. The seminary, I have been told, on the death of the last surviving member of the family, will receive close on to two million dollars. One of the Jesuit churches here will receive almost a million, and the archdiocese, as a result of this immense gift, will become one of the wealthiest ecclesiastical corporations in the Christian world."

There is no present danger in this country that ecclesiastical wealth will become so great by bequests that the Government will have to interfere and sequester it as in England, France and Mexico and elsewhere, but a believing Church ought to be able to do its own evangelizing and not need the pious gifts of the dead. Churches don't die. They are corporations and their wealth accumulates.

The School Problem in Germany

The protagonists of advanced theological thought are determined to wrest the control of the schools from the Church in Germany. At present religious instruction in the Bible, in catechism, hymn book and the like forms an all important part in the work of the public schools, and this work has been

in charge of the Church and has been conducted in the spirit of traditional orthodoxy. Now the advanced men within the Church and the radicals without have organized to have all this changed. The one class demands that in the schools there shall be taught what is in harmony with the most advanced thought in reference to Christ, the Bible, Christianity, etc., while the others, and especially the Monists, with Haeckel as their guiding star, demand a complete secularization of elementary education. In many portions of Germany the teachers themselves are with the advanced class. In the forefront of general discussion at present are the so-called Zwickau theses, adopted by the school teachers of Saxony at a convention held in Zwickau, which insist upon the absolute abrogation of the Church's influence in the schools. The agitation has spread rapidly to Oldenburg and other Protestant centers. The governments themselves in the different countries of the Fatherland are practically a unit in standing with the Church, but have been compelled to yield in not a few cases to the demands of the radicals. The agitation is evidently only in its beginnings and the whole matter of the religion of the young is involved. We have no such problem here, because we long ago left the teaching of religion to the Church.

We regret that Lord Northcliffe, owner of the London *Times*, should have joined those that predict a dash from the German army and navy against Great Britain. In an interview in Winnipeg he predicts war, and says that the Krupp gun works keep 100,000 men busy day and night and Sundays preparing for war. He even quotes the opinion of some people that the war will be declared in 1912. We would have a lesser punishment inflicted on English prophets of evil than that which Kipling tells us was meted out by Kholam Hyder, the Afghan chief, to the garrulous Wali Dad:

"His sire was leaky of tongue and pen,
His aim was a clinking khattak ken.
And the salt had gone to the very of such,
For he carried the curse of an unstaunched
speech."

He heard the report that the Russians were coming and hastened to tell it to the Red Chief. Kholam Hyder smiled darkly, and bade the talebearer climb a peach tree and stay there and watch to report their coming, unfed and with bayonets ringing the tree. On the seventh day madness took him,

"And he fell, and was caught on their points
and died."

It is an extraordinary, if not incredible, report which comes from Montreal that twenty-five priests have been excommunicated for refusing to obey the orders of the Pope, who had refused to permit the removal of their seminary from Marieville, near St. Hyacinthe, to St. Johns. The Catholic Directory gives eighteen priests to this petit seminary of Ste. Mary de Monnoir, of which the Very Rev. J. A. Lamieux is president. The Bishop of St. Hyacinthe, who is said to have excommunicated them after they proceeded to purchase a site for their seminary, is the Rt. Rev. Alexis-Xyste Bernard. Such a rebellion on the part of the entire faculty is so surprising that some further explanation is required, for they could expect no students against the prohibition of the higher authorities.

It is an English officer who tells our readers that the scum and riffraff of the London streets swept into the army would stand no chance beside the brave mountaineers of North India, who constitute the native army. That is a very different confession from the brag of the old story of the Englishman who, when asked by Frederick the Great if an equal number of Englishmen could whip his guard of big Pomeranian grenadiers, replied, that he did not know, but that one-half their number would be very glad to try it. And we recall that Addison tells us that after hearing a waterman who had lost a leg in the naval battle of the Hogue, Sir Roger de Coverly said "that one Englishman could beat three Frenchmen; that we could never be in danger of Popery so long as we took care of our fleet."

Since the seven cadets at West Point were expelled for a brutal hazing, there have been efforts to have their punishment relieved by allowing them to fall back a year, on the ground that it is too severe for the offense. We cannot see it so. They have no reason to complain. The Government has been very generous to them, has given them free instruction of the best sort, where there is not a bit of electives, and free board and all expenses paid. All the Government does now is to stop giving them a gratuity. They only have now to change their plans as to what business they shall engage in, which many another boy has to do. Let them and their friends be grateful and not complain.

We are glad that, in giving last week the decision of the Papal Biblical Commission on Genesis, we made our own translation from the Latin text, and did not depend on the presumably accurate translation of the *London Tablet*, which we find followed elsewhere. It is far from perfect. For example, the second paragraph contains these words as part of the teaching condemned:

"It can be taught that these three chapters of Genesis do not contain accounts of things actually done, *which correspond to objective reality and historical truth.*"

The important words in italics are omitted. Less important is the change of "historical" to "religious," a few lines further down.

The present-day tendency to prop up Christian belief by calling in the aid of the imagined miracles of mediums, mind-readers and interpreters of the subconscious is sharply and sensibly criticised by Professor Coe in the leading article in the *American Journal of Theology* for July. But his rhetorical question: "Twenty-five years ago, what Protestant clergyman found anything but delusion and moral decay in it?" is susceptible of an answer. Was not that just about the time when the Rev. Joseph Cook was trying to lead Christian apologists into that same blind alley by the

credence he gave to the tricks of Mr. Home, better known to the readers of Browning as "Mr. Sludge, the Medium"?

Little Rostock is the only German university which now refuses full matriculation to women. The summer half-year counted 1,432 women students, against 1,168 for the previous winter semester. The general studies of philosophy, philology and history attracted 699 women, nearly half, while 371 studied medicine, 245 mathematics and natural sciences. Twenty-three studied law and four theology. Besides these there were 1,152 "listeners" not working for a degree, or 2,582 in all.

We are not ready to credit hastily the report that the Young Turkish Government, in its desire to placate Christian Powers, intends to turn the control of the Holy Sepulcher at Jerusalem to Germany. To put it into the hands of a Protestant nation would not please France or Russia, and while Germany might be willing to increase her influence in Turkey she would not find it pleasant to be the arbiter between the monks who fight for their privilege in it.

If a mob had the intelligence of the omniscient God lynching would not be so bad; but lynchers may make mistakes. There is the case last week of a mob at Duncan, Miss., where a negro was charged with killing a policeman, and when the mob could not get at the supposed culprit they killed his brother accused of helping his escape. It turns out that the policeman was killed by a shot from another policeman.

It is not strange that the proposal comes to divide the State of California into two States. It is large enough for two, and growing rapidly in population; and the interests of South California are quite different from those of North California. We expect that one of these days Texas, which is a rapidly growing State, will claim its right to be divided into four States.

Why Not an American Credit Foncier

IT is comparatively easy for the very rich man to invest his surplus. The stock exchanges are organized to help him in this regard and a thousand agencies conspire together to lend their aid. The rich investor may pick and choose. When the poor man emerges from his poverty with a small surplus of two or three hundred dollars or more and no experience whatever in the difficult art of investing, he is confronted by conditions that are by no means theoretical. Frank Bailey, writing not long ago in the *World's Work*, pointed out the injustice done under prevailing systems to a poor Jewish investor in real estate whereby his investment was wiped out. The man to whom particular reference was made bought real estate for the purpose of establishing a home. His lack of experience and his inability to finance his investment because of panic conditions were but one in a large number of cases more or less similar. Institutional or individual loans on New York real estate bought for use as a home ought to be very safe investments because New York City has a much smaller proportion of people who own their own homes than is the case in any other city in the United States, and the demand for homes is a healthy sign as well as an example of thrift that ought to be encouraged. Notwithstanding the growing demand for real estate for homes instead of tenements, which must forever lack the home atmosphere, this demand is not materially encouraged because of the lack of financial institutions in New York organized to cater to the small investor. Here and there certain institutions, including building and loan societies, but none of the savings banks, are willing to make small loans, ranging from less than one thousand dollars, on approved real estate for 60 per cent. of its value, which is the maximum allowed by the laws of New York governing savings banks. It is

a fact, moreover, that none of the large life insurance companies and but few of the large savings banks in this city seek after or accept the small mortgage. These financial institutions regard with more favor the placing of a single loan of \$250,000 in one mortgage, requiring but one appraisal and a single mental operation, than the making of fifty mortgages of \$5,000 each. France is infinitely ahead of us in so far as equipment is concerned for handling and caring for small loans on real estate used as homes. Paris has its *Crédit Foncier* of France, whose province it is to finance the establishment of homes for the lowly as well as for those more exalted in rank. This institution has arrangements providing for the payment of mortgages in monthly instalments according to definite plans ranging from ten to seventy-five years. This country needs such an institution and the poor man who has aspirations and just a little money will welcome its advent.

....The latest report of the National Bank of Commerce in New York shows, in addition to its capital of \$25,000,000, and surplus of \$10,000,000, undivided profits of \$5,594,511, and total resources of \$266,280,810.13.

....There is, generally speaking, considerable ground for thinking that the prospectus, in the opinion of a very large class of persons, has passed from the realm of *belles lettres* into fiction. This may account for the fact that Manhattan savings banks are carrying \$35,000,000 more on deposit now than was the case a year ago.

....The Columbia Trust Company, whose capital is \$1,000,000, surplus and profits \$1,500,000, and assets \$17,000,000, has declared a quarterly dividend of 2 per cent. The officers of the company are: Willard V. King, president; William H. Nichols, vice-president; Howard Bayne, vice-president and treasurer, and Langley W. Wiggin, secretary.

The Independent

VOL. LXVII NEW YORK, THURSDAY, SEPTEMBER 23, 1909 No. 3173

Survey of the World

Mr. Taft Begins His Long Tour

The President began, on the afternoon of the 14th, his journey of about 13,000 miles thru nearly three-quarters of the States. That evening he was the guest of honor at a dinner in Boston, given by the Chamber of Commerce. At the beginning of his address he spoke of his journey, which, he said, would involve much hard work and, he believed, would make him "a wiser man and a better public officer." Turning to questions to be considered by Congress, he referred to the work of the Monetary Commission. "It is certain," said he, "that our banking and monetary system is a patched up affair which satisfies nobody, and least of all those who have a knowledge of what a financial system should be." It was quite apparent from the statements of Mr. Vreeland (chairman of the House Committee on Banking and Currency) and the conversations of Mr. Aldrich (chairman of the Monetary Commission and of the Senate Committee on Finance) that the trend of the minds of the commission was "toward some sort of arrangement for a central bank of issue which shall control the reserve and exercise a power to meet and control the casual stringency which from time to time will come in the circulating medium of the country and the world":

"Mr. Aldrich states that there are two indispensable requirements in any plan to be adopted involving a central bank of issue. One is that the control of the monetary system shall be kept free from Wall Street influences, and the other that it shall not be manipulated for political purposes. These are two principles to which we can all subscribe."

The commission's report might be delayed beyond the next session of Congress. In the meantime, the members of the Commission intended to institute

a campaign of education. He had been told that it was Mr. Aldrich's purpose to lecture in many cities of the Middle West on the defects and needs of our monetary system:

"I cannot too strongly approve of this proposal. Mr. Aldrich, who is the leader of the Senate and certainly one of the ablest statesmen in financial matters in either house, has been regarded with deep suspicion by many people, especially in the West. If, with his clear-cut ideas and simple but effective style of speaking, he makes apparent to the Western people what I believe to be his earnest desire to aid the people and to crown his political career by the preparation and passage of a bill which shall give us a sound and safe monetary and banking system, it would be a long step toward removing the political obstacle to a proper solution of the question."

We were, unless all signs should fail, on the eve of another great business expansion and era of prosperity. The "hum of prosperity and the ecstasy of great profits" might dull our interest in those reforms the need of which was shown while Mr. Roosevelt was President, unless we should insist upon legislation to clinch and enforce by positive law the standards which should be upheld:

"Nothing revolutionary, nothing disturbing to legitimate business is needed; but we must set the marks clear in the statute by which the lines can be drawn and the proper, legitimate paths be laid down upon which all business shall proceed, and must have it understood by means of prompt prosecution and punishment that the law is for all and is to be enforced even against the most powerful."

Our country was making progress. "Occasionally one hears a note like that of Governor Johnson denouncing the East and calling upon the West to organize in a sectional way against the East because the East is deriving more benefit from the governmental policy than the West and at the expense of the West." But it was difficult to treat such an appeal

seriously. He went on to show how closely related to each other were the several parts of the country, "all in the same business boat," the prosperity of one adding to the prosperity of others, and the depression of one followed by depression elsewhere. Born and brought up in the Middle West, having a New England ancestry and New England associations, with knowledge of the West coast gained by his service in the Pacific, and knowledge of the South acquired thru his jurisdiction as a Judge, he felt that he could speak with confidence in respect to the whole nation, and that as President he might well lift up his voice "to protest against any effort, by whomsoever made, to arouse section against section and Americans against Americans":

"Never in the history of the country since the war has the feeling between the North and the South been more cordial and friendly than it is today, and a political attempt to make a cleavage between New England and the East on one side, and the West on the other, will be found to be so utterly hopeless as to confound those who propose it."

Labor Unions and the Law's Delay

Arriving at Chicago in the middle of the day on the 16th, the President rode for eleven miles in an automobile between lines of cheering school children. There were 150,000 of these, and each one carried a small American flag. Mrs. Ella Flagg Young, superintendent of public schools, was the only woman on the reception committee. In the afternoon he was taken to see a game of baseball between the Chicago and New York clubs. "Put me with the other 'fans,'" said he, and there he was placed, with a plentiful supply of peanuts and lemonade. Speaking in the evening at a mass meeting, his subjects were labor organizations and the defects in our administration of criminal law. Having referred to his defense of his own labor decisions during the campaign preceding the election, and to the attempt to array the labor vote against him, he said he had not forgotten his promises, and that at the coming session of Congress he would recommend legislation on the subject of injunctions:

"I know there is an element among employers of labor and investors of capital which is often opposed to the organization of labor

I cannot sympathize with this element in the slightest degree. I think it is a wise course for laborers to unite to defend their interests. It is a wise course for them to provide a fund by which, should occasion arise and strikes or lockouts follow, those who lose their places may be supported pending an adjustment of the difficulties.

"I think the employer who declines to deal with organized labor and to recognize it as a proper element in the settlement of wage controversies is behind the times. There is not the slightest doubt that if labor had remained unorganized wages would be very much lower. It is true that in the end they would probably be fixed by the law of supply and demand, but generally before this law manifests itself there is a period in which labor, if organized and acting together, can compel the employer promptly to recognize the change of conditions and advance wages to meet a rising market and an increase in profits, and on the other hand can delay the too quick impulse of the employer facing a less prosperous future to economize by reducing wages.

"Nothing I have said or shall say should be construed into an attitude of criticism against or unfriendliness to those workmen who for any reason do not join unions. Their right to labor for such wages as they choose to accept is sacred and any lawless invasion of that right cannot be too severely condemned. All advantages of trades unionism, great as they are, cannot weigh a feather in the scale against the right of any man lawfully seeking employment to work for whom and at what price he will.

"Of course when organized labor permits itself to sympathize with violent methods, with breaches of the law, with boycotts and other methods of undue duress, it is not entitled to our sympathy. But it is not to be expected that such organizations shall be perfect and that they may not at times, and in particular cases, show defective tendencies that ought to be corrected."

Those now in active control of the Federation of Labor and the railroad unions, he continued, had "set their faces like flint against the propagandism of socialistic principles." All of us who are in favor of the maintenance of our present institutions should recognize this "battle which has been carried on by the conservative and influential members of trades unionism." Concerning the administration of criminal law, he said:

"It is not too much to say that the administration of criminal law in this country is a disgrace to our civilization and that the prevalence of crime and fraud, which here is greatly in excess of that in the European countries, is due largely to the failure of the law and its administrators to bring criminals to justice. I am sure that this failure is not due to corruption of officials. It is not due to their negligence or dishonesty, but of course there may be both in some cases; but it is chiefly due to the system, against which it is impossible for an

earnest prosecutor and an efficient judge to struggle."

We had unwisely reduced the power exercised by a judge in a trial, until "he has hardly more than the moderator has in a religious assembly." The tendency of our legislation was "to throw the reins on the back of the jury and to let them follow their own sweet will." On the civil side, he would reduce delay by limiting the cases in which appeals might be taken. He would abolish altogether the payment of court officers by fees. The difficulty in the administration of both the criminal and the civil law was undue delay, which was especially to the disadvantage of the poor. He thought the time was ripe for the appointment by Congress of a commission to recommend for the Federal courts reforms which would be models for the courts of the States.

—Speaking briefly on the 17th at the State Fair in Milwaukee, he advocated postal savings banks because they would greatly encourage thrift "on the part of those who are just wavering in the balance whether they shall save the money or use it, because they do not know where they can put it safely."

Defense of the New Tariff

The President's speech in explanation and defense of his action concerning the tariff was made on the night of the 17th at Winona, Minn., and there were indications of his desire to help Representative Tawney, the only member of the Minnesota delegation who voted for the Payne-Aldrich bill. Repeating the tariff utterances made by himself in last year's campaign, he asserted that neither these nor the party platform contemplated a revision that would injure a protected industry. He insisted that the changes made should be measured (as Mr. Payne sought to measure them), not by the volume of imports, but by the relation of reductions or increases to the entire volume of consumption in the country. Neither he nor the party had agreed to make reductions that would reduce prices by the introduction of foreign competition. His defense of the changes in the cotton goods schedule was in accord with Senator Aldrich's argument. Conceding that the woolen rates were too high, he explained that the agreeing wool growers and wool

manufacturers were strong enough to prevent any change and to defeat the bill if it carried a reduction. Pointing to the "tremendous cuts" in the iron schedule, he asserted that in them had been accomplished the chief purpose of the downward revision, to prevent an increase of prices by monopoly. Admitting that the tariff increased the prices of certain necessities, he asserted that the recent increase in the cost of living was not due to tariff rates. On the whole, he was bound to say that he thought the new tariff the best one the Republican party had ever passed. It was a substantial achievement in the direction of lower tariffs and downward revision. Asking what had been the duty of a member of Congress who desired a greater reduction than was made, he defended the action of Mr. Tawney:

"Now I am not here to criticize those Republican members and Senators whose views on the subject of the tariff were so strong and intense that they believed it their duty to vote against their party on the tariff bill. It is a question for each man to settle for himself. The question is whether he shall help maintain the party solidarity for accomplishing its chief purposes or whether the departure from principle in the bill as he regards it is so extreme that he must in consequence abandon the party.

"All I have to say is in respect to Mr. Tawney's action and in respect to my own in signing the bill that I believed that the interests of the country, the interest of the party required me to sacrifice the accomplishment of certain things in the revision of the tariff which I had hoped for in order to maintain party solidarity, which I believed to be much more important than the reduction of rates in one or two schedules of the tariff."

"Had Mr. Tawney voted against the bill and there had been others of the House sufficient in number to have defeated the bill, or if I had vetoed the bill because of the absence of a reduction of rates in the wool schedule, when there was a general downward revision and a substantial one, tho not a complete one, we should have left the party in a condition of demoralization that would have prevented the accomplishment of purposes and a fulfilment of other promises which we had made just as solemnly as we had entered into with respect to the tariff."

While the bill was the best tariff bill ever passed, there were other reasons, he continued, why it ought not to have been beaten. He referred to the maximum rates, the net earnings tax and the just provisions for the Philippines. It would have been an unwise sacrifice of business interests and of party solidarity and efficiency to defeat the bill. Such defeat

would probably have caused the defeat of measures for the improvement of the Anti-Trust law and the regulation of interstate commerce, which are needed "to clinch the Roosevelt policies." He then spoke of the board of experts recently appointed, and it could be inferred from what he said that they would ascertain costs of production. But he did not intend to report the results of their inquiries unless compelled by Congress. They held no brief for either side. He should direct them to make a glossary or small encyclopedia of the tariff. It was utterly useless to talk of another revision during the term of the present Congress. He thought it would take the entire term of this Administration to accumulate the data upon which a further revision could be made.—In Minneapolis the President received a hearty message of welcome from Governor Johnson, then in a very critical condition. He sent a most cordial letter in reply. In a public address he prayed for the recovery of the Governor, saying that the latter's qualities were of great value to "the people of the nation, who no doubt will insist in time that he shall serve them."

Mexico and Central America

Some expected an uprising against the Mexican Government during the celebration of President Diaz's birthday, on the 15th, and of the anniversary of Mexican independence, on the 16th, but there was no disturbance, except for a short time in Monterey, on the night of the 15th, where a riot was quickly suppressed by General Trevino, who cut off the supply of light on the streets and called out his troops. It is predicted that Gen. Bernardo Reyes will soon withdraw from public life. He has published a statement saying that he has never been a candidate for the Vice-Presidency, and that no one should be a candidate for that office who is not in accord with the policies of President Diaz and personally acceptable to him.—It is now known that nearly 15,000 persons were drowned by the floods in the vicinity of Monterey. Thousands of corpses lie in the valleys and ravines, and many who survive are in a pitiable condition. Several small cities were destroyed. Tula, one of these, had 6,000

inhabitants, and one-third of them were drowned. Since this disaster there has been much loss of life and property on the coast of the peninsula of Lower California. A cloudburst left La Paz in ruins, and a tidal wave overwhelmed the town of Mulege.—After the recent purchase by Mr. Thompson, the American Ambassador, of the railroad, 244 miles long, from San Geronimo to the Guatemalan boundary, a company was formed for the construction of a road southward from that boundary to the Panama Canal, a distance of 1,400 miles. It will begin work in Salvador the coming winter.—An agreement concerning the Emery claim, a cause of friction with Nicaragua for some time past, was signed last week in Washington. Nicaragua buys back the mahogany concession, paying the owners of it \$600,000.—The Congress of Costa Rica has refused to approve the contract made in New York for refunding the debt of the republic.—It has been decided by the Department of Justice at Washington that the new tariff law does not apply to the Isthmian Canal Zone, because the Zone is not a possession of the United States, but only a place subject to use, occupation and control for the particular purpose of making and maintaining a canal.—All danger of war between Bolivia and Peru on account of the arbitration award concerning disputed territory has been avoided by the signing of an agreement. The terms have not been published, but it is said that they provide for an acceptance of the award, with some modifications relating to territory now inhabited by Bolivians.

The Cook-Pearry Controversy

The dispute between the friends of the rival claimants for the honor of discovering the North Pole has not been settled by the week's discussion, but rather has become more heated and involved thru counter-criticism and mutual recrimination. The controversy is obviously complicated by old antagonisms. There is first the rivalry of the two New York newspapers, the *Herald* and the *Times*, who received respectively the exclusive stories of the two explorers, and who are enthusiastically championing their claims. The fact that

Admiral Schley was the leader in the collection of funds for Dr. Cook, while Commander Peary receives the official support of the navy, has brought up the ghost of the Sampson-Schley feud. Each man's life is subjected to microscopic scrutiny. Dr. Cook's claim to have ascended Mt. McKinley after his associates had left has always been disputed, and those who are skeptical of this feat now assert that he is again trying to impose upon the public a similar fiction. On the other hand, Peary has, in the course of his long career, made many enemies, who feel that he has been arbitrary and selfish, and are inclined to sympathize with Cook for that reason. Undoubtedly the enthusiastic reception and credence given to Cook by the Danish people was in some degree due to their dislike of Peary, on account of his treatment of Capt. Otto Sverdrup when the two explorers met in the Arctic regions. The University of Copenhagen, on September 9, conferred the honorary degree of Doctor of Science upon Dr. Cook, in the face of Mr. Peary's denial of his claims, and as the "Oscar II" of the Scandinavian line, bringing him to New York, stopped at Christiansand, it was received with a salute of seven guns by order of King Haakon. It was at first reported that Rasmussen, a half-breed Danish-Eskimo, who met the two young Eskimos of Cook's expedition at Etah, did not get from them a confirmation of his discovery, but this report is now denied. On the other hand, the conduct of Harry Whitney, to whom Cook said he entrusted his instruments and records, is quite inexplicable. He started back on the "Roosevelt," but instead of coming on to New York with these invaluable documents, he transferred to the "Jeanie" and went on another hunting trip into the interior of Greenland. A telegram received from him makes no reference to Cook's discovery of the Pole, but merely says he claimed to have reached a more northerly point than any former explorer. Peary's friends charge Cook with having used the Eskimos, dogs and supplies which Peary had collected at Etah for his own expedition. On the other hand, the house which Cook built out of packing boxes at Annotok for his reserve

stores, and which he placed at the disposal of Whitney, was seized by Peary on the assumption that Cook was dead. He placed an ignorant boatswain in charge, who bartered away some of Cook's provisions for fox and bear skins, and was with great difficulty persuaded to give shelter to either Whitney or Cook. Rudolph Francke, the steward whom Dr. Cook left in the hut, was found there sick by Mr. Peary on his previous trip, and was brought back to New York. In return for this Peary is said to have taken over a quantity of blue fox skins and walrus ivories, and also to have sent in a bill for \$100 to Mr. Bradley, Cook's backer, for bringing Francke to the United States "for humanity's sake." Commander Peary telegraphed to the *Herald* that Cook was 'handing the public a gold brick,' and has stated that he can prove that Cook never went a hundred miles from land. His belligerent attitude has aroused some unfavorable comment, as it is in marked contrast with the refusal of Dr. Cook to say anything disparaging about his rival. While Cook has done nothing during the week to substantiate his claims, the criticism which was brought against the probability of his story has been refuted in a very amusing way by Peary's account. The Pearyites held that an average of 15 miles a day, as claimed by Cook, was impossible; that Cook's narrative was bald, unenthusiastic and lacking in important details; that he had no competent companions to confirm his discovery; that he stayed only forty-eight hours at the Pole; that the ice was impossibly smooth and solid; and that the early start, so long before daylight, was unprecedented. But Peary reports an average sledge drive of nearly 20 miles a day; his narrative has much the same deficiencies as Cook's; he also had no other scientist with him; he stayed only thirty hours at the Pole; he found the ice sheet as favorable as Cook; and he, too, started in the night. An embarrassing feature of the controversy is the arrival of both explorers in New York, with the "Roosevelt" and the "Jeanie," about the time of the Hudson-Fulton celebration, when hundreds of thousands of people will be ready to do honor to one or both of the explorers.

Aviation The sensation of the week in the world of flight is the success of M. Santos-Dumont in a new monoplane of his invention. M. Santos-Dumont is a rich Brazilian who lives in Paris and has for years devoted himself to the study of aviation. He was the first to make the small dirigible balloon practicable, and attracted a great deal of attention by cruising across Paris and around the Eiffel Tower. Then he dropped ballooning, apparently because he became convinced, by the success of the Wrights, that the future of aviation lay with the aeroplane, and has now again come to the front with a model as unique and practical as his Parisian "run-about." It is a smaller machine than any previously constructed, weighing only 260 pounds with the pilot, and having only 9 square yards of supporting surface, as compared with the 22 yards in the Curtiss, 26 in the Blériot, and 53 in the Wright aeroplanes. It is driven by a two-cylinder motor of 30 horse-power, and makes over 50 miles an hour. He tried the "Butterfly" Friday evening, at St. Cyr, near Paris, and suddenly disappeared over the horizon, much to the alarm of his friends, who vainly scoured the country in automobiles, until two hours later they received a telegram from him, announcing his safe arrival at Mantes, 30 miles away. He declares that he has no desire to make money out of his invention, but will place his patents and designs at the disposal of all who wish to utilize them.—Orville Wright capped the climax of his feats in the Tempelhof field, near Berlin, on the same evening, by breaking the record for height. A small captive balloon was put to a height of 102 meters, which is 7 meters over the record of M. Latham at Reims, and Mr. Wright sailed far above it, reaching an estimated altitude of about 765 feet. He also made a new record for passenger service, carrying Captain Engelhardt, his pupil, in a flight of more than an hour and a half, sailing high over the buildings surrounding the parade ground.

Lord Rosebery and
Mr. Asquith

If the Government Finance Bill is defeated it will be probably due largely to Lord Rosebery's speech at Glasgow. His speech, altho

witty and eloquent as usual, did not bring forward any new or stronger arguments, but the mere fact that the former Liberal premier found himself obliged to denounce the policy of his former associates has greatly strengthened the Opposition. He explained at the outset that he spoke as an independent politician, but he protested that he had not left the Liberal party, but that the party had left him, in entering upon its campaign against landed property. He admitted that the land tax was small, but called attention to the statements made by both the Prime Minister and Chancellor of the Exchequer that it was capable of indefinite expansion. "This," he said, "is the comfort offered to the land tax payer. The tax is so small that it is like the dum-dum bullet—it enters the body and makes a small hole, but when it gets into the body it expands and kills the victim." An increment duty on lands was something of an absurdity for the loss on the capital value in the land of Great Britain in the last thirty years had been over one thousand million pounds:

"And that is the prosperous industry that the Government has set out, by every means in its power and every principle it can distort, to tax almost out of existence! Many landowners will disappear and all will be crippled under the cumulative taxation of a property that is already so affected. But why should we waste today any compassion on landowners? After all, they are damned according to the spirit of the age by owning property at all—and they are doubly damned by owning property in land. But I sometimes ask why this class was so peculiarly penalized. When had the landowners become part of the criminal class? They had rendered great service to the State for many centuries, they have been centers of employment and bounty and civilization. From land have come most great servants of the State; they have conducted the arduous rural administration of the country without emolument and without pay—a fact which fills every foreign visitor with admiration and awe—and then suddenly a new Government comes in and tells them they are pariahs and may go about their business."

Lord Rosebery was particularly severe in his criticism of that provision in the bill which makes gifts within five years prior to a person's death liable to the death duties on the ground that it was inquisitory, absurd, and would unsettle titles and restrict individual freedom. We quote his peroration:

"England has begun to enter upon this path. Let her persist in it a few years and one will

see where it will lead the country which liberty made the richest in the world and the mightiest since the Roman Empire. I do not say on this point all that is in my mind. I wish to speak with restraint, as I speak with regret, tho there is little left for one in my position but the melancholy and unpopular privilege of telling what he believes to be true. I think my friends are moving on the path that leads to socialism. How far they are advanced on that path I will not say, but on that path I, at any rate, cannot follow them an inch. Any form of protection is an evil, but socialism is the end of all, the negation of faith, of family, of property, of monarchy, of empire. And so, with real sorrow, I find in it the parting of the ways, and I myself must go a different road, the road of public economy, of strengthening, not weakening, character, of propping, not undermining, public confidence; and in doing so I shall preserve as my poor consolation the recollection that it is the way on which we built up the strength of our nation, the strength of our commerce, our greatness, and our dominion."

Lord Rosebery refused to commit himself on the question of what was the duty of the House of Lords in regard to it beyond saying that it was his deliberate conclusion that the Government was trying by provocative speeches to induce the Lords to throw out the bill. Premier Asquith, in his reply to Lord Rosebery at Birmingham, took up this point and declared that for the House of Lords to reject the measure would be the most formidable and fundamental revolution since the days of the Long Parliament. In matters of finance the House of Commons had an absolute decisive voice and if the House of Lords should attempt to reject or amend the bill it would mean financial and administrative chaos:

"Is this issue going to be raised? If it is, it will carry with it consequences which he would be a bold man to forecast. That way revolution lies, and if it is going to be seriously threatened, involving, as I may venture to predict it will, issues far wider and far deeper than the mere right of the House of Lords to meddle with finance, I say that the Liberal party is not only ready but anxious to take up the challenge."

Mr. Asquith stated that the bill had a double object; to raise revenue and to put into the market land artificially withheld, with a view to dissipating congestion of population and paving the way for a healthier people. The increment tax was not a tax upon land or even upon any capital now existing, but a tax upon value which is to be created in the future by the community as a whole, not by the

industry of the land owner. Mr. Asquith, in his visit to Birmingham, was much annoyed by the suffragets, who have become more violent in their methods and attacked him from the roofs of the houses with slate and other missiles.

Foreign Notes

It is reported from Athens that the dissatisfaction of the military with the withdrawal of Greek claims to Crete, in compliance with the demand of Turkey, will ultimately lead to the forced resignation of King George. In that case his successor would probably not be Crown Prince Constantine, but his nineteen-year-old son, Prince George.—The protest of the foreign consuls against the torture of El Roghi, the Moroccan pretender, and his followers, by the Sultan, had an effect quite the opposite of what they intended. El Roghi, when he was captured by the Sultan's troops, had been brought to Fez and was kept exposed to public view in an iron cage. The remonstrances of the consuls infuriated Sultan Mulai Hafid, and, leaving the audience chamber in a rage, he had the pretender taken into his palace and shot in the presence of the harem.—General Marina, commander of the Spanish forces at Melilla, has received 11,000 more men, and is said to be ready to make his long-delayed advance movement against the Riffians. The Liberals in Spain are incensed against the Government for the continuance of the censorship of the press, and the opposition parties are uniting for the purpose of overthrowing Premier Maura.—The movement against the Jews in Finland continues to grow in strength, and they are likely to be expelled from that country altogether. In Russia, on the other hand, there is some alleviation of their lot. The Minister of Education attempted to bar them entirely from entering the universities, but he has been overruled by the Cabinet, and the same percentage will be admitted as formerly. They are allowed to enter freely the technical and commercial schools, and a larger proportion will be henceforth permitted in the secondary schools, that is, 5 per cent. of the total number of students in St. Petersburg, 10 per cent. in Russia generally, and 15 per cent. inside the pale.

A SELECTION OF PAINTINGS IN THE
HUDSON-FULTON LOAN COLLECTION
OF OLD MASTERS IN THE METROPOLITAN MUSEUM

ROBERT FULTON. (Benjamin West.)
Painted by R. Edouard Lefebvre.

Gift of the Hudson-Fulton Celebration Committee to the Metropolitan Museum of Art.

JOEL BARLOW. (Robert Fulton.)

Loaned by Judge Peter T. Barlow.

In the Hudson-Fulton Celebration Exhibition at the Metropolitan
Museum of Art.

MRS. TRUMBULL. (John Trumbull.)

Loaned by George H. Story.

In the Hudson-Fulton Celebration Exhibition at the Metropolitan
Museum of Art.

NELLIE CUSTIS. (St. Memin.)

Loaned by R. T. Hames Halsey.

In the Hudson-Fulton Celebration Exhibition at the Metropolitan
Museum of Art.

JOHN PELHAM. (Cortis.)

Loaned by Mrs. W. P. Halsey.

In the Hudson-Fulton Celebration Exhibition at the Metropolitan
Museum of Art.

LUCRETIA (Rembrandt, Van Ruisdael)

Loaned by M. C. D. Borden

Gift of the Trustees of the Peabody Essex Museum, Salem, Mass., U.S.A.

NICOLAUS RUTS (Rembrandt van Rijn)

Loaned by J. Pierpont Morgan

In the Hudson Estate Celebration Exhibition at the Metropolitan Museum of Art

GIRLS WITH A CAT (DIRK BOUTS)

Painted by T. Porphyre, Munich.

Reproduced by permission of the Trustees of the National Gallery, London.

THE MARQUIS D'ANDELOT.
(Rembrandt Van Rijn.)

Loaned by Richard Mortimer.

In the Hudson-Fulton Celebration Exhibition at the Metropolitan Museum of Art.

A YOUNG PAINTER. (Rembrandt Van Rijn.)

Loaned by J. Pierpont Morgan.

In the Hudson-Fulton Celebration Exhibition at the Metropolitan Museum of Art.

PORTRAIT OF A LADY. (Frans Hals.)

Loaned by J. Pierpont Morgan.

CALM SEA. (W. Van De Velde.)

Loaned by M. C. D. Borden.

In the Hudson-Fulton Celebration Exhibition at the Metropolitan Museum of Art.

THE PARAGON STEAMBOAT

From an original drawing by Robert Fulton.

From "Clermont" to "Lusitania," Is It So Far a Cry?

BY PARK BENJAMIN

IN the original advertisement of Fulton's "North River Steamboat," dated September 2, 1807, it was promised that the steamer would "leave Paulus Hook Ferry on Friday, 4th of September, at six in the morning, and arrive at Albany on Saturday in the afternoon." Passengers on the Cunarder's "Lusitania" and "Mauretania" now leave New York City on Wednesday morning and disembark from the train at the railway station in Paris on the following Tuesday, in time for early breakfast. An advertising map has already appeared in which the railway connections in the United States and in the United Kingdom are shown with the intervening ocean depicted as a mere strait. If only the distance annihilating capabilities of the "Clermont" of 1807, and of the "Lusitania" of 1909, be taken to measure the advance in steam navigation accomplished in the intervening period, then indeed the cry from one ship to the other is a far one; but is it so otherwise?

Great progress in any field and between any two epochs in the world's history is always the product of great discoveries and inventions made in that field and during that interval. Between 1807

and 1909 and in the single field of electricity have come to pass the telegraph, the telephone, electric traction, electric light and wireless transmission. On the other hand, in marine engineering and in the same time, no single great invention at all comparable to these has been made. The screw propeller had not only been invented, but had actually been applied to a steamboat by Colonel John Stevens, three years before the "Clermont" was launched. The compound steam engine was invented by the contemporaries of James Watt in the eighteenth century. The steam turbine, latest of all steam motors to be applied to practical use, is in fact the oldest of all of them. It started with the aelopile of Hero of Alexandria, two centuries before the Christian era, and reached a form virtually the same as that which it now has, nearly 300 years ago. And in marine architecture as well as in motive power and machinery, the progress has been due to refinements of things and ideas already achieved and conceived. Tested by the work of inventors and discoverers, the cry from the peaceful "Clermont" to the equally pacific "Lusitania" does not seem to be so far,

But steam navigation is not confined only to merchant ships, and altho it took nearly fifty years to revolutionize the navies of the world, it did revolutionize them and incidentally the whole science of naval warfare. It rendered obsolete all of the time-honored maneuvering for the weather gage, and today, in an action between two fleets, otherwise equal, it is almost axiomatic that the swiftest fleet will win. Of course, and it is well known, the modern battleship is further ahead of the sail-driven three-decker of 100 years ago—even of 50 years ago—than the latter was of the Roman or Greek oar-propelled galley. And yet, after all, the one great circumstance which marks the interval between the memorable voyage of the fleet of Ulysses and that of the fleet of Sperry is the rise and fall of sail power. Indeed the Homeric description of the oar-driven galleys as "wondrous ships, self-moved, instinct with mind" applies far better to the steel monsters which were lately massed in the Thames to fright the souls of fearful German adversaries, than to the wooden walls surmounted by swelling canvas which swept to victory at Trafalgar and Aboukir Bay.

Besides, the steam man-of-war differs from the steam passenger vessel only in her weapons—offensive and defensive—and the same difference was in the Roman galleys. The war triremes sank one another with their rams, while the unarmed transports of Claudius Caudex were driven across the Sicilian Strait by paddle-wheels worked by oxen.

Nor was it reserved for the last half of the nineteenth century to build up great armored citadels on steam impelled platforms. The first steam warship of our own navy, in point of novelty of construction, was as far different from the existing wooden line-of-battle ship as is the modern "Connecticut" or "Wyoming." Our grandfathers would look with little more astonishment upon the present Dreadnaughts than they did upon the United States steamer "Demologos" or "Fulton" the first—with her twin hulls placed one beside the other, her great engine with a cylinder four feet in diameter driving her from the Brooklyn Navy Yard to Sandy Hook and back—53 miles

—in eight hours, her unexampled armament of thirty 32-pounders discharging red hot shot, her sides nearly five feet in thickness, her submarine gun, for throwing 100 pound shot into her antagonist below the water line, and her powerful pumps for wetting the enemy's powder or scalding his crew with hot water from the boiler. We prided ourselves vastly on that ship—scared the British with her. She cost us \$320,000—a huge outlay for the day. We kept her until 1829 when, thru carelessness, her magazine blew up killing twenty-four people, and incidentally the only woman known to have lost her life on an American warship. Fulton himself contrived the vessel, and died before her successful trial trip was made. The modern steam battleship is not a product of evolution, but merely a congeries of more or less desirable things hooked together as circumstances have demanded. So was the "Fulton" the

Robert Fulton

After a painting by Chappel

first. The original British "Dreadnaught" was built the other day to try out in one bottom all the novelties which the British Navy League was clamoring for. The "Fulton" the first was built a century ago as an epitome of everything Fulton could think of or discover likely to prove disagreeable to an enemy afloat.

At the present time, the City of New York is engaged in celebrating Robert Fulton, and the newspapers are telling everybody that he "invented the steam-boat." But he did not. Blasco Garay and Dennis Papin both suggested the

1790 he maintained a sort of passenger service between Philadelphia and Trenton. The list could easily be extended if it were worth while. When Fulton made his happy coalition with Livingston in 1801, which ended in the latter obtaining, from the Legislature of New York an extension of his monopoly of steam navigation, the air was literally full not only of steam navigation but of the imminence of the boat which the lawmakers required should be capable of steaming four miles an hour.

The situation did not call for the in-

LANDING OF HENDRICK HUDSON
After a sketch existing by Robt. W. Wier.

steam vessel centuries before Fulton's day. Hull patented it in England in 1736. William Henry ran a steam paddle-wheel boat on the Conestoga River in 1763, Periet, one on the Seine in 1774. Rumsey's vessel, in 1786, attained a speed of four miles per hour against the current of the Potomac, and in the distinguished presence of George Washington. The State of New Jersey gave John Fitch a patent for the exclusive right to steam-navigate the waters of that State for fourteen years from 1788, and in

ventor, but for the promoter and the engineer. Ninety per cent. of the success of any new thing, which the public is asked to accept, depends upon management. Livingston had all the astuteness of the latter day promoter—that sanguine soul whose life is spent in endless endeavor to sell things he hasn't got to people who don't want them—and to Livingston's acumen Fulton added what was equally as needful, engineering skill and experience. He had made actual experiments to determine the resistance of

fluids, actual experiments in about all the known methods of steam propulsion, and all his gathered experimental data gave him what the workers who had preceded him in the same field did not have—the ability to calculate sizes and proportions of boat and machinery; so that the vessel, when produced, would be practical and operative and competent from the start to achieve commercial success. Two weeks after she made her trial trip her regular departures were advertised. Since then the world has not been without steamboats.

But it is rapidly nearing the time when it will be. The discovery of the art of producing electricity—not heat—from carbon by the direct attack of the oxygen of the air is perhaps still too far below the horizon to be reckoned with, but the controlled combustion engine, the gas engine of the automobiles and already of the motor boats, is very much here. Before this, with its oil or gas fuel, the steam boiler must eventually go. It is already going in the warships, for gas retorts are far less dangerous to those on board than shells of confined steam, and the resulting economy of fuel space is great. But beyond the rivalry of the gas engine stands the inherent defect of

marine steam propulsion—that in the last analysis it depends not on the endurance of iron and steel, but, as it always has from the beginning, on that of human flesh and blood. It is something startling to remember that despite her colossal frame, despite her tremendous machinery, the “Lusitania’s” annihilation of the ocean depends upon the man behind the shovel: equally startling to recall that no matter what courage and skill direct the terrific powers of the warship, without the hand and muscle work of the half naked men who feed the great furnaces in the fierce heat of the stokehole, she is but an inert and helpless mass. The automaton which shall feed the fires of a steam vessel has not yet appeared. And so long as this remains true, the steam boiler is doomed, and steam navigation is decadent. At all events, it is at least a question whether we should not celebrate the unnamed hero who fed the blazing logs under the copper kettle of the “Clermont” as well as the engineer who worked out the proportions of her hull and engines.

And so from this viewpoint also, from “Clermont” to “Lusitania,” again seems not so far a cry.

NEW YORK CITY.

Knickerbocker Redivivus

BY CHARLES BATTELL LOOMIS

AUTHOR OF “CHEERFUL AMERICANS,” ETC.

WHY I went down to Mulberry street is not germane to the plain account of what befell me there which I shall set down in as many words as my editors will let me use, their idea being “the fewer the better.”

“Why not forbear saying anything at all?” said I. “Won’t that be the easiest way out of it?” But I laughed as I said it.

“It’s like this,” said they. “You have had an adventure that seems to accord with the spirit of the Hudson-Fulton Celebration, and we wish you to set it forth in appropriate words. If the thing is not too long we shall be glad to use it,

but if it is too long we cannot print it at all.”

So, to begin at the beginning, I went down to Mulberry street on a certain errand and fell to wondering as I walked among the alien population just where had stood the Columbian Hotel, famous as the abiding place of a story teller who a hundred years ago was wont to give rein to his vagrom fancies in a manner new to the staid Western world.

I stepped aside to make way for a stout Italian woman who bore a basket upon her head and stood where I had stepped, while a Chinaman carrying his little son went on his way; then, after a

Polish Jew had made a third in the cosmopolitan trio, I walked on and came on a crowd of thoughtless youngsters who were setting on an old man very much as the village idlers set upon Rip Van Winkle upon his return to his native village in the Catskills.

"Ullly gee, pike de ol' geezer!" said a little gamin whose ancestors were peat burners in the days of the "Clermont." As he said "pike" he threw a tomato that was not perfectly good at the old man, much as if the word "pike" meant "to throw."

I cannot bear to see old people harshly

gentleman, quaintly removing his cocked hat and bowing, said, "That is my name."

Diedrich Knickerbocker, the very man who wrote the veracious history of Rip Van Winkle, of whom he had reminded me when I first saw him.

Here was the Hudson-Ful—

Why, my goodness! It was Mynherr Knickerbocker himself who wrote an account of the discovery of the Hudson by "Master Henry Hudson," he who had set forth the whole diverting history of the Dutch occupation of New Amsterdam, a history, by the way, that must have seemed a little coarse in spots to the

THE ARRIVAL OF CAPTAIN HUDSON AT SANDY HOOK, SEPTEMBER 3, 1609.
From a lithograph by Russo & Browne.

used, and I stepped up to the old gentleman and said, "Can't I assist you?"

And now a strange thing occurred. As I looked at him it fell into my mind to describe him, quite as if I were writing an article about him, and these are the words I used: "He was a small, brisk-looking old gentleman, dressed in a rusty black coat, a pair of olive velvet breeches, and a small cocked hat. He had a few gray hairs plaited and clubbed behind, and his beard seemed to be of some eight-and-forty hours' growth."

No wonder that I said those famous words than I involuntarily ejaculated "Diedrich Knickerbocker!" and the old

fastidious generation that flourished during the concluding years of the Victorian era, but which now, in the light of the later endeavors of the younger "literati" of New York and London, is as innocent of all offense as Mrs. Hemans's poems.

Here was the Hudson-Fulton Celebration upon us and I had had the rare good luck to stumble on a man who in his day had known his New York as few have known it since.

I did not ask him how he had compassed his return; it was enough for me that he had come back. I am not one of those who, when a man tells me he has discovered the North Pole, immediately

begin to ask for proofs. I saw that this old man could have sat for F. O. C. Darley as old Diedrich Knickerbocker; he told me that he was indeed that worthy, and I would not insult him by asking him to explain how he came to be in the land of the living.

I knew that in the *Evening Post* of a hundred years ago, lacking four weeks, had appeared an account of his mysterious disappearance, I knew that he had come back to New York long after he was given up for dead, I knew that Mr. John Bigelow, who was born only seven years later, is still with us, keenly observant, and still writing for the press, and here was "Mr." Knickerbocker, a little older than John Bigelow, but sturdy enough yet.

Let proof be for those who lack imagination. Here was the man who had sung the praises of old Peter Stuyvesant and had cast a glamor over things that were very Dutch—I made up my mind that I would show him around a little if I could do so without fatiguing him.

It has long been a theory of mine that your up-to-date citizen of any age will always remain up to date in his tendencies no matter how long he may have been gathered to his fathers if you are fortunate enough to induce him to revisit these glimpses of the moon; so Pliny would have made an excellent reporter on the San Francisco *Examiner* after the earthquake; Pepys, were he to come to life, could and would get a job on *Town Topics* and provide spicy accounts of the doings of modish and other folk on old Manhattan Island; while if Benjamin Franklin were brought back to the scene of his many triumphs he would astonish Philadelphians in, say, a fortnight by setting out for Washington in an automobile of his own invention, there to take out a patent on an improved aeroplane.

But Diedrich Knickerbocker was not of an inventive frame of mind, all that he wrote of "Mannahatta" was the literal truth, and I thought I should have died of joy when, after I had wiped off the tomato stains from his fusty old coat, he stopped and looked up at a little eight story building, and said in an awed tone, "Is it possible that they build to such heights now?"

Then he added, "And the city is quite

built up, is it not? I always thought it would cover at least two miles north from the Battery."

"My dear man," said I, "get a tight grip on yourself and listen. New York now extends northward for upward of eighteen miles; it includes Brooklyn, Staten Island and the Bronx."

"What do you mean by the Bronks?"

I explained and went on. "There are upward of five million inhabitants in —"

"The United States?" said he, plainly surprised.

"In the Greater New York," I said, but he looked hurt as if I had jested on a serious topic. I wanted to tell him of the millions upon millions that now make up our population, of our new possessions, our great railroads, our dozens of novelists living by writing alone, even as he had done in his later years, but I felt that I must not pour too much in at once. He would stand it all in time, but he must have some leisure for readjustment.

"Suppose," said I, "that we lunch at the Astoria?"

"Have they an inn at Astoria?" asked he, then stopped in amazement as he saw the top of a building towering southward. "I've often been there in my bird-nesting rambles as a boy——"

"Yes, but this is another Astoria—still in the family, you understand."

He understood and laughed drily. "The Astors always had a sort of prescience in real estate matters," said he. "And tell me, are there any famous descendants of the Stuyvesants, now?"

"Surely there must be, altho I can't call to mind any one who might be called a national figure except Stuyvesant Fish, one time president of the Illinois Central. By the way, speaking of Illinois, would you like to go to Grant's tomb, after lunch?"

"Grant, Grant—there is nothing Dutch in that. Who was Grant?"

I explained to this dear old gentleman who Grant was; I also gave him in a few words a short history of the United States, with an account of the Civil War and an eloquent eulogy of Lincoln. I tried to make him understand how Lincoln was an even greater name to conjure with than Washington, and was much amused to hear him sniff at Washington.

"First in war," began he, and I half expected him to execute the foot shuffle with which the quotation concludes in these modern days, but he contented himself with a chuckle that seemed to belittle the great Virginian's memory. I have read this into his chuckle, but set it down nevertheless, well knowing that "the Father of his Country" was no hero to some of his contemporaries.

We had come as we talked to the Bowery. Suddenly the old man's eyes opened to their widest extent and he held his fingers to his ears, the while his lower jaw dropped. I followed the direction of his eyes and there was nothing more awful than an elevated train, but it had nearly been the death of him.

"Why," said he, "that bridge is built just for wantonness; there is no water below—and tell me, how can carriages go at such speed without horses? The grade is up if anything, so they are not moving by force of gravity."

"Why, that's been a commonplace for a generation; first it was steam and now it is electricity that supplies the motive power. Now this," said I, pointing to a rapidly moving dray, piled high with heavy casks of ale, "is comparatively new——"

The old man shuddered and ran into a doorway—almost frightened to death by a harmless motor cycle, bearing a vibrating young man who was being shaken to his destination.

"Believe me," said I, "we have progressed since the Dutch took Holland, and if you will take my word for its comparative safety we will get into a taxicab and take a turn about town. I dare say you would like to see the Battery."

At mention of that spot the old man's eyes moistened and I felt that I had unconsciously hit on a favorite spot of his long-vanished youth.

"You'll find it changed," I told him, "but in spots it is still 'pleasantly overrun by a carpet of grass and clover and overshadowed by . . . trees.' And still the 'young men and maidens of the town take their evening stroll, watching the silver moonbeams as they tremble along the calm bosom of the bay; and peradventure interchanging the soft vows of honest affection,' to quote your own account—you see we remember you yet,

sir. But now there are very few Dutch among the strollers—Irish, Germans, French, Hungarians, Italians, Greeks, Syrians, Jews, Russians——"

"You astound me! So the Dutch are all gone?"

"Oh, here and there may be found a man of Dutch descent; the most popular President of recent years was one Roosevelt, as Dutch in his obstinacy as Peter himself, and among the younger writers of remarkable promise is a Gouverneur Morris, who in time will be *the* Gouverneur Morris, but neither he nor Theodore Roosevelt would think of walking along the winding paths of the Battery of a summer afternoon unless they were waiting for the Staten Island boat——"

"A pleasant sail."

Just then a taxicab emptied itself of a passenger, and, hailing it, I showed Mr. Knickerbocker in and then got in myself, telling the chauffeur to take us to the Battery and to stop at a subway station on the way.

It was worth while having been born in this later age to see the astonishment of the simple old soul as we rolled smoothly along without horses.

"There were those who prophesied it," said he. "Franklin, of Philadelphia, who represented us at Versailles, even went so far as to say that in time we should fly. But, of course, that is an absurdity.

For answer I took out of my pocket the first edition of the current *Evening Post*, now in its 110th year, and showed him the accounts of the exploits of various aviators at home and abroad. And then, as luck would have it, I saw people looking eagerly into the heavens and at the same moment our chauffeur stopped the cab and called to us that a man in a dirigible balloon was passing overhead.

We got out to look and the old man's eagerness was equaled by my own, for I had never seen such a sight before. Gracefully it sailed this way and that and from the ether came the mellow sound of a French horn which some one in the balloon was playing. Above the din of the city in every sense, it was wafted to us, seeming to me to trumpet in the arrival of a new era in locomotion.

As we stepped back into the cab he said, "And only a short hundred years since my history was published!" And I

suppose," he continued, "that people now cross the ocean in Fulton steamboats in twenty-four hours, and that men can project visions of what their friends are doing at the moment in China or Peru, and that dogs and horses can talk and sing——"

"Not quite as fast as that," I laughed. Then I told him of the phonograph and telephone and passing a picture show at that moment, I bade the chauffeur stop that we might see a motion play.

The pictures that were being thrown upon the screen when we took our seats depicted the "Half Moon" sailing up the Hudson with Hudson and Juet very much in evidence, and to my astonishment the old man wept like—like an old man.

The subway he would have none of. "Caves remind me that we are mortal," said he, "and if carriages can run without horses on bridges and on the surface of the ground they can surely run thru the hollows of the earth. But," said he suddenly, "New York is founded upon a rock. How can there be caves such as you describe beneath it?"

When I told him he was more astonished than he had been at anything he had heard or seen. The thought that man had bored thru solid rock miles and miles; had even pierced his way under the Hudson and the East Rivers—this gave him pause and for upward of five minutes he did not speak. He sat, his hands on his stick and his chin on his hands, lost in thought.

As we came to the Battery the "Mauretania" sailed up the river, having just failed of beating her own record. He saw her, but for a long time he could not realize what she was, nor could he grasp the significance of her size.

I feared that he was taxing his credulity and was glad when the monster steamed out of sight.

I was sorry I had taken him to the Battery—it was evidently so much changed, so horribly disfigured since he had seen it last in the days when Washington Irving might have been met there, his eyes looking in the direction of that shore he so longed to visit, and where he was so cordially received when he finally compassed the passage of his amiable presence across the great waters.

The skyscrapers old Diedrich could not quite take in; he half believed them mountains; that they were full to overflowing with busy workers, not one in ten of whom had ever heard of the Dutch occupancy of Manhattan Island, he could not realize even when I told him.

"If our country has grown so large why do so many congregate here? It seems impious, indecent—such numbers like—like—vermin."

When, after a sad journey thru dismal Greenwich street, decay apparent to the most cursory glance, we came out on Hudson street and he saw the Singer Building from its best vantage point, Hudson street near Twelfth, nothing would do but he must go back and climb it—he said he had climbed to the top of St. Paul's just after the Revolution and it had not tired him.

In vain I protested that it was too much of a climb unless a man were to practise for it; that it would probably kill even me: he was all for going up, so at last I fell in with his whim, quite sure that a half dozen flights would make him glad to take the elevator.

But I did not know the stuff of which he was made. Up, up, up, up he walked, briskly, and I panted behind him, fearing that heart disease was lurking somewhere about the tenth story.

Whenever I sat down exhausted he would leave me, and going to a window, feast his eye on the ever-widening horizon, but up we must walk.

It was after three when we started and it was nearly five when we had climbed to the top. I was not entirely dead, but my muscles were swelled so that I fell in a heap on the roof.

The old historian seemed quite devoid of sympathy, laughing at me and saying that American stock could not equal the old Dutch, but he was not unkindly, and when I explained to him that we of this generation use stairs very little and that I had never climbed forty stories before he said, "Then we will get parachutes—isn't that what you call them?—and drop down. What a view, what a stupendous view! And Old Amsterdam buried under the mass of brick and stone. And aliens in the land. The bilious Yankees overcame us at last. Tut tut."

After some minutes of silent revery he

again returned to our mode of descent and suggested parachutes.

"No, no," I laughed; "balloonists sometimes do such tricks, but the day of the parachute as an ordinary article of commerce is not yet upon us, wonderful as have been our strides."

"Nonsense," said he, somewhat testily, going over to the corner of the railing and picking up two umbrella-like affairs.

They were really umbrellas, as I afterward learned, and they bore the advertisement of some clothing company and were part of an advertising scheme which had not yet been "sprung" on the public.

As we stood there the bells of Old Trinity announced the hour of five; then from the hives below us began to pour a swarm of bees.

"I never say so many ants, even," said

the old gentleman. "It is stupendous, tremendous, horrendous. Ninety millions, the North Pole discovered, safety razors, patent leather shoes, Krupp guns, steam scythes, the Japanese civilized, China's door open, Washington a saint—good-bye, I've had enough."

As he said this he put up the big umbrella and jumped from the great Singer tower.

I uttered a cry of horror, but it was needless. Slowly he floated out over Broadway, slowly but safely, and in spite of the shouts of thousands who saw him and with American wit yelled to him to go back, he kept on down, and at last touched Broadway gently and became an indistinguishable unit in the mighty stream that makes its nightly exodus from the scenes of the day.

LEONIA, N. J.

The Optimist

BY LA TOUCHE HANCOCK

If you're a pessimist, and would be an optimist,
That gloomy look first banish from your face,
Don't think all will be sunny, if you make a mint of money.
For, as a rule, that isn't quite the case.
Don't hanker after pelf, but obliterate yourself,
And of your neighbor think a little more,
Just make a trifling test to serve *his* interest,
You'll find 'twill add a fortune to your store.
Give up that daily bustle, that much belauded hustle,
Go quietly to work, and you will see
The advice "*festina lente*" will bring you luck in plenty.
Of true success it's always been the key!
Have perseverance, tact, when business you enact,
Lose cheerfully, and try to conquer fate,
And, if perchance you meet with moment'ry defeat,
Your energies for vict'ry don't abate.
Then always be content with everything that's sent.
You'll find that this is very good advice,
For it is a stable creed that, if you would succeed,
You'll have to pay a very goodly price.
Seek what in life is sweet, and you are sure to meet
With all the pleasure you set out to gain,
Cast dismal thoughts away, for a hopeless yesterday
Will bring a glad tomorrow in its train!

NEW YORK CITY

HENRY HUDSON.

ROBERT FULTON.

Henry Hudson's Portrait, Autograph and Name

BY GEN. JAMES GRANT WILSON

VICE-PRESIDENT, HUDSON FULTON CELEBRATION COMMISSION

ON the south side, and near the west end of the Governor's Room of the New York City Hall there hangs, in an exceedingly unfavorable light, an oil painting purporting to be a portrait of Henry Hudson. The tradition is that it was painted by Count Pulaski and presented, more than a century ago, to the municipality by a member of an ancient Dutch family of this city. Such was the statement made to the present writer some two score years ago by David T. Valentine, then Clerk of the Common Council. When the picture was for the first time finely engraved on steel in 1891, for the first volume of my "Memorial History of New York," a diligent and careful search of the city records as far back as 1730 only resulted in disappointment, as no trace of former ownership, or of the authenticity of the portrait, was discovered. Foiled in my secretary's search of the city archives, I next attempted to learn something of the history of the painting from other sources. From a volume published in

1827, entitled "The Picture of New York and Stranger's Guide to the Commercial Metropolis of the United States," by A. T. Goodrich, we take the following extract. Speaking of Henry Hudson, the author says:

"A portrait of this distinguished navigator is in the City Hall, painted in 1592, when he was twenty-three years of age. He is represented with a frill round his neck, and holding a compass in his hand; he has a youthful and very interesting appearance. It was deposited by an ancient Dutch family, and is of undoubted originality."

Washington Irving's description of that "worthy and irrecoverable discoverer" is not at all in harmony with this handsome traditional portrait of Hudson, who is described by Irving, but without giving his authority, as "a short, square, brawny old gentleman with a double chin, a mastiff mouth, and a broad copper nose, which was supposed in those days to have acquired its fiery hue from the constant neighborhood of his tobacco pipe!" Neither of these descriptions in the least resembles the Captain Hudson

of John Collier's oil painting of "The Last Voyage,"* in which the heroic explorer is represented as being set adrift with his son and seven sailors in Hudson's Bay by his mutinous crew on a June day, 1611. This is, of course, a purely imaginative portrait, like the representation on the bronze doors of Trinity Church, New York, and the counterfeit presentments on the medal, poster and seal of the Hudson-Fulton Celebration Commission.

In an interview with the late Sir George Scharf, C. B., Keeper of the National Portrait Gallery of England, who

GIOVANNI VERRAZANO

Earlier claimant to the discovery of the Hudson, 1524.
From the collection of the National Portrait Gallery,
to be erected in Battery Park.

was deemed the greatest living authority upon portraiture, he expressed the opinion that the New York portrait afforded no grounds whatever for the supposition that it represented Henry Hudson. On the contrary, he did not consider the dress that of a sea-explorer, nor of his period, also that the picture did not represent an Englishman, the features in his judgment more resembling those of a Spaniard. Sir George was strong in the belief that there was no existing genuine portrait of Hudson, and he doubted if any had ever been made. After a thoro

search in England and Holland the writer shares in that opinion. A considerable sum was offered by him in London and Amsterdam for engravings of the explorer, or even for information concerning any genuine portrait, but without result, the traditional City Hall painting of Captain Hudson being the only one known in those countries. This picture has appeared during the present year in more than a thousand books, magazines and journals, and generally without the statement that it was an apocryphal portrait. Whoever painted the picture, it certainly was not Count Casimir Pulaski, for he was too much occupied fighting the enemies of Poland and later, after the fall of his native land, for American freedom, for which he died in October, 1779, to find time to paint portraits. No compass is discoverable on the canvas, as stated by Mr. Goodrich, for no hand appears in the picture, nor can I credit his assertion that it was painted more than three centuries ago, in the year 1592.

The Governor's Room, so called from the circumstance of its containing full length and other portraits of a large number of the State's chief magistrates, also pictures of many of the Presidents and relics of Washington, including his large mahogany writing desk, is a hall open to the public. No visitor to the Hudson-Fulton celebration who feels an interest in the discoverer of a magnificent river which perpetuates his name, and desires to see his traditional portrait, should fail to go to the New York City Hall. The cornerstone was laid in 1803 by Mayor Edward Livingstone, and when completed was considered the finest public edifice in the United States. The stately hall on the second floor where the Hudson picture hangs has recently been renovated and restored at the expense of the gracious and generous lady who has just given half a million dollars to circulate the Bible in foreign lands, who paid about one-third of that amount for Constitution Island on the Hudson, as a gift to the Government to enlarge West Point, and who contributed a considerable sum to increase the floral attractions of Central Park. Hudson's por-

*The painting is now in the collection of the National Portrait Gallery, London.

trait was probably never painted, and in this particular he was less fortunate than Robert Fulton, who was delineated in marble by Houdon, the famous French sculptor, and on canvas by himself and his art preceptor, Benjamin West, president of the Royal Academy.

My personal search abroad for any writing of Houdon's, or even his autograph, was as unsuccessful as the quest for authentic data concerning his portrait. Even the offer to a London dealer of one hundred dollars, and the same sum to an Amsterdam archivist, failed to produce a note or a signed document of any description, written by the English captain. I particularly desired his signature to place under the portrait of Hudson, it being the only one among the fifteen hundred vignettes contained in my "Cyclopedia of American Biography" that is unaccompanied by a facsimile of an autograph. Mr. W. Noel Saintbury, assistant keeper of the English Public Records, wrote:

"I have delayed answering your letter requesting signature until I have exhausted every available source for obtaining one. Hudson was for so short a time a prominent man that very little, indeed, is known authentically about him. . . . In my 'Colonial Calendar, East Indies,' 1513-1616, are several incidental allusions to him and to his widow and son. The former was assisted by the East India Company and the latter was taken into their service, but there is not a particle of Hudson's writing in this office, neither is there in the British Museum, where I have had search made. There is no will in Doctors' Commons, [Somerset House, London], and it is not likely that he ever made one—if he did, it went to the bottom of the deep with him. As you will see by the enclosed the answer of their secretary, I have written to the Hudson Bay Company, so that I feel convinced the search is hopeless."

May I be permitted to again allude to the strange continuance of the attempt to rob the explorer of his birthright? In the contract made with the Dutch East India Company at Amsterdam, January 9, 1609, he signed his name Henry Hudson, and in the body of the instrument he was so named, being accompanied by an interpreter, as the Captain did not understand Dutch, in which language the document was written. In this voyage he discovered the magnificent river which immortalizes his name.

He sold his service, but he did not sell his name, and it is a kind of sacrilege to steal a man's baptismal name. The governments of Great Britain, the Netherlands and the United States officially recognize Henry Hudson as the English explorer's proper name, and the authorities of the State and City of New York, as well as the Hudson-Fulton Celebration Commission, which they created, also recognize him as Henry Hudson. The distinguished Dutch, English and American scholars, Van Meteren, Macaulay and Motley, call the Captain Henry Hudson. Our country's chief historians, Avery, Bancroft, Bryant, Fiske, Irving, Parkman and Prescott, all describe the English discoverer as Henry Hudson, and so far as I am aware there is not now, and there never was, the slightest authority or excuse for misnaming him. In the light of the above statements, is it not a cruel wrong to deprive the great discoverer of his name and nationality by calling him Hendrik or Hendrick, as if he were a Dutchman, when it is absolutely certain that Hudson was an English sailor who could neither read, write, nor speak the language of Holland? To continue to commit this crime, as many still persist in doing, would seem to the writer to be unimpeachable evidence of phenomenal ignorance, or Batavian obstinacy.

The words of the refrain of "Henry's Prophecy," which follows, were used by Captain Hudson when he sailed in the "Half Moon" through the Narrows, and for the first time saw the beautiful bay of New York, with forest-covered Manhattan, and the noble Palisades in the distance:

Flow fair beside the Palisades, fair Hudson,
fair and free,
By proud Manhattan's shore of ships and
green Hoboken's tree;
So fair yon haven clasped its isles, in such a
sunset gleam,
When Henry and his seaworthy men first
rounded up the stream,
And climbed this rocky palisade and resting
on its brow,
Passed round the corner and gazed awhile on
shore and wave below,
And Henry drank with hearty cheer and
loudly then cried he:
"This is a good land, and good to see, and
pleasant land to see!"

Then, catching sight of my people, I—
 glowing to his face;
 He seemed to see the mightier space between
 the ocean's heart;
 When other streams by other strands run
 through their forests fair,
 From bold Missouri's lordly tide to leafy
 Delaware.
 The Sacramento, too, he saw, with its sands
 of secret gold,
 And the sea-like Mississippi on its long, long
 courses rolled;
 And great thoughts glowed within him;—
 "God bless the land," cried he;
 "'Tis a good land to fall in with, men, and a
 pleasant land to see!"

"I see the white sails on the main; along the
 land I view
 The forests opening to the light, and the
 bright ax flashing thru;
 I see the cots and village ways, the churches
 with their spires,
 Where once the Indians camped and danced
 the war-dance round their fires;
 I see a storm come up the deep—'t is hurrying,
 raging o'er
 The darkened fields—but soon it parts, with a
 sullen, seaward roar.
 'Tis gone; the heaven smiles out again;—God
 loves the land," cried he;
 "'Tis a good land to fall in with, men, and a
 pleasant land to see!"

"I see the white sails on the main; I see on all
 the strands
 Old Europe's exiled households crowd, and
 tall's number'd hands
 From Hessenland and Frankenland, from Dan-
 ube, Drave and Rhine,

From Netherland, my sea-born land, and the
 Norseman's hills of pine,
 From Thames, and Shannon, and their isles—
 and never, sure, before,
 Invading hosts such greeting found upon
 stranger shore.
 The generous Genius of the West his welcome
 proffers free;
 'Tis a good land to fall in with, men, and a
 pleasant land to see!"

They learn to speak one language; and they
 raise one flag adored
 Over one people evermore, and guard it with
 the sword;
 In gay hours gazing on its six and forty stars
 above,
 And hail it with a thousand songs of glory
 and of love.
 Old airs of many a fatherland still mingle
 with the cheer,
 To make the love more glowing still, the
 glory still more dear—
 "Drink up-sees out! join hands about! bear
 chorus all," chants he;
 "'Tis a good land to fall in with, men, and a
 pleasant land to see!"

Henry Hudson, a contemporary of
 William Shakespeare, emerged into the
 light of English history on April 19,
 1607, in the Church of St. Ethelberga,
 London, where with eleven companions
 he took the Holy Communion as prepa-
 ration for his first voyage, and disap-
 peared in June, 1611, during his fourth
 voyage, in the depths of the gloomy
 Arctic waters that bear his honored
 name.

NEW YORK.

Rip, Robert and Hendrick and 1909

BY POULTNEY BIGELOW

RIP VAN WINKLE was
 taking his ghostly walk
 about the base of the
 Catskills last week. The
 moon speckled the broad
 Hudson like a vast span-
 gled stretch of blue silk
 —a mile wide at my win-

dow. Now and then he whistled for
 "Schneider"—that is his dog. At length
 the whistle was answered—Rip in sur-
 prise strolled toward the unexpected
 sound—but stopped suddenly at sight of
 another midnight shade—obviously a
 mariner of bygone times.

"My name is Hudson—Hendrick
 Hudson"—said the stranger, "and I've
 come to look at my river."

"Ah! I've heard of you before," said
 the polite Rip. "Glad to know you.
 Have a drink?"

The ghostly flask was passed, after
 which Hendrick stooped to the edge of
 the river, filled his broad felt hat with
 water and was about to slake the thirst
 of nature when Rip seized him and with
 frightened look: "Don't drink of that—
 its full of disease germs!"

"Nonsense!" said the simple navigator.
 "When I sailed up here in the 'Hali

Moon" all these upper reaches were like mountain lakes filled with the sweetest water. What has happened to this water?"

"That water would be just as sweet today," answered Rip, "but it is now the habit of our people to pour the sewage directly into the river so that now not only do we not drink it—we have almost ceased to bathe in it."

Hendrick shook his head and was going to say something about clean Dutchmen and dirty Americans when a third ghostly party interrupted their talk.

"Pardon me," said the newcomer, "my name is Fulton, Robert Fulton. I have been here before, and yet somehow I feel as tho things had been changed. I am looking for the home of my old Captain of the 'Clermont'—Brink was his name."

Rip welcomed Fulton from the same flask that had cheered Hudson—then pointing to a knoll close to the Malden Dock:

"There is the place—there lived Brink and his wife and there the 'Clermont' rested after her first glorious day's run."

"Then," said Fulton, pointing across the river, "there is the home of Chancellor Livingstone, where he and Captain Brink and myself discussed the building of the 'Clermont.' But what is that monstrous ugly building that I see on the river bank?"

"That," answered Rip, "is one of the many ice houses that are filled during the winter with cakes of frozen sewage."

"And who consumes this stuff," asked the innocent Fulton.

"The people of New York drink it by way of refreshment."

"But don't they have typhoid fever," asked the puzzled shade.

"Plenty of it," answered the practical Rip. "They like it in New York—it helps business—its good for the undertakers, the doctors and bartenders!"

Hendrick Hudson showed signs of impatience, and calling Rip's attention to some fishing nets hung up at the lower end of the Malden Dock said drily:

"Does sewage help business for these fishermen?"

"That's so," said Rip, "but then there are so few of them left that we don't bother about them. We don't get any

more salmon here and the shad is scarce and bad and the river is now so filthy that a fisherman can spend half his time cleaning his nets."

"In my day," said Robert Fulton, "this river was a sportsman's paradise—water clear and clean as an Adirondack lake; most luscious shad, cheap and abundant—and now!"

"Now," said Rip, "our politicians are building the longest, biggest and costliest aqueduct of the whole world in order to bring water into New York—it will cost about as much as

the work on the Panama Canal."

"But," queried Hudson, "why not stop sewerage into my beautiful river—then lay iron pipes and pump pure water forever and ever and as much as you want."

"Yes, we thought of that," answered Rip, "but that's too simple for us—much too easy. Besides there would not be enough money to go around among our politicians. Just a hundred miles of iron pipe in the bottom of the river and a few pumps may appeal to the old-fashioned

ROBERT FULTON.

After a steel plate engraving by G. Parker of a painting by Benjamin West

people and foreigners, but we Americans want to beat the record in the spending line and we mean to have the costliest aqueduct on earth."

"Will the supply be adequate when the costliest of aqueducts shall have been finished?"

"No," said Rip, pleasantly—"and besides it will desiccate every stream in my Catskills as tho mopped up with blotting paper, we shall have more typhoid in this region than we have even now—but we don't care—we are going to have the costliest aqueduct on earth and also the costliest Hudson-Fulton Celebration—"

"Costliest what?" exclaimed Hudson and Fulton in a breath.

"Haven't you heard," said Rip, "we're going to spend a barrel of money along this river, all in honor of your great discoveries. I supposed you had come to the celebration!"

The two ghosts rubbed their noses and said nothing.

"Don't you both feel mighty proud and happy," asked the now perplexed Rip Van Winkle?

"Don't think us rude," answered the shades in one breath. "We appreciate your good intentions, but we are a little old-fashioned and should feel a little out of place amid all the glare and noise that is projected in our honor!"

"Well, but how else could we celebrate a great national festival," asked Rip.

"We had hoped," answered the shades, "that you would have let us see our beloved river more beautiful if possible than when we knew it. Instead of that you offer me the smell of a national sewer. We look for a river with charming banks from which thousands disport themselves in swimming or in pleasure boats—but no bathing houses do I see and very few pleasure craft. Instead of this I see the whole population turning

its sewage into what was intended as a Godlike reservoir."

"But do not European cities do the same?" asked Rip.

"Certainly not," came the thundering answer. "London drinks the upper Thames; Paris drinks the upper Seine; Berlin drinks the upper Spree—these are the three greatest cities of the Old World and they do not make a sewer of their water supply!"

"But what can we do then to please you—how celebrate the Hudson-Fulton anniversary?"

"Do!" answered the shades. "Stop wasting money on noise and ephemeral theatrical display. Build us a monument worthy of a civilized and Christian nation. Build a dozen bridges across the river and thus relieve the congestion of population in New York. Then stop poisoning the Hudson. Pump your sewage out to where it belongs—not into your rivers but out upon the great sandy wastes of Long Island. Thus you will banish fever; you will give your people clean water to drink; you will restore prosperity to the fishermen; you will add to the food supply of the people; you will once more make it safe to swim in the river; ice will no longer be a menace to health and all business will improve under the magic of healthy conditions."

"When our river shall have been cleaned then let us meet again—here on the old Malden Dock!"

"Until then—farewell!"

As Hendrick Hudson disappeared with Robert Fulton, Rip whistled again and this time "Schneider" came and with him he mused over what he had heard.

He took another pull at his flask.

"Maybe they're right, but I don't see why they don't like this river as it is. They're not patriotic, that's what's the matter with them."

—HENDRICK HUDSON, NEW YORK

Renewal of the Great Struggle in Westminster Palace

BY JUSTIN MCCARTHY

THE Government has settled down again to its work at the budget, it that can be called "settling down" which is the renewal of a fierce, unmitigated conflict, maintained thru the night as well as thru the day, between the two great opposing parties of our present time, the Free Traders and the advocates of what is called Fiscal Reform, which is in fact but the old-fashioned Protection. The House of Commons may be said to sit thruout the whole of every working night as well as of every working day, and the members of that House are now to be seen returning to their homes somewhere about 5 or 6 o'clock on most mornings, and returning to their homes only to snatch some limited interval of rest in order to enable them to settle down to their work again in the day.

One is carried back in mind to the old times, which I at least am not likely soon to forget, the times when the Irish National party was carrying on its unintermittent struggle for the interests of the Irish people, and was thus compelling the House of Commons to fight its battles by starlight as well as by sunlight, in the dawn as well as in the dusk. The general impression is that the session cannot be brought to its close before the end of October, and then will come the sending up of the completed financial measure to the House of Lords, to be followed, no doubt, by the final constitutional appeal to the country itself thru the medium of a general election.

Meanwhile there are many important questions, as well as those belonging to finance, which might well occupy the attention of the representative assembly if only that assembly could possibly give up its attention just now to any subject belonging to foreign affairs. There are threatenings of war here and there and almost everywhere abroad. There are wars actually going on, and in some of the Continental states of Europe there

are conditions which seem likely to lead to the most critical decisions on the part of great European Powers. The disturbances in Spain seem to foretell either a complete destruction of the popular revolutionary movement or the intervention of some leading European states to restrain the Spanish monarchy from the establishment of a definite despotism. Then that which I may describe as the Greek question—I mean the question of the future condition of Crete—seems as if it must bring about some very decided action on the part of those great European states which have taken to heart the interests and the protection of the Greek island. Crete is in every sense as distinctly a part of Greece as the Isle of Man is a part of England, and the utterly unexpected policy of the state which we now call Young Turkey, in acting as if it were determined to keep the island in continued subjection to foreign rule, seemed at one time as if it were destined to bring about the intervention of England and of France on behalf of the Cretan Islanders and therefore of the Kingdom of Greece. It is still to be hoped that Young Turkey will prove faithful to her promises of maintaining a liberal, a constitutional, and a representative system of government thruout her domains, and that she will not compel any of the European Powers to interfere in arms on behalf of justice and freedom and the now almost universally recognized cause of nationality. Meanwhile we who constitute the outer public in England have had our attention much occupied by what the newspapers will persist in calling the "heat wave" which is now sweeping over us. After a summer, the greater part of which might fairly have been described as a winter hardly in disguise, we have been visited by many successive days of a genuine glowing summer, which has turned our attention away very much indeed even from flying machines and

JOHN BRIGHT

feats of swimming across the British Channel.

The deepest sympathy is felt among all classes and all political parties in these countries with Mr. Lloyd-George, the Chancellor of the Exchequer, in that most heavy calamity which has just befallen him, the death of his beloved and only sister. This sad news came from Wales, where the lady had her home. The dead lady was Mrs. Mary Davies, wife of the commander of a great ocean steamship. Mrs. Davies had spent some time in the home of her brother in London during last April, and she had fully shared in all his political views and projects and purposes, and had, in fact, before her marriage acted as housekeeper for many years for Lloyd-George and his brother. When some twelve years ago she became the wife of Captain Davies her house was still open as a home to Lloyd-George and his brother whenever they desired to make use of it. She had been for many years suffering from a serious internal complaint, and it appears that it was Lloyd-George himself who first became convinced that the trouble was one threatening the utmost dan-

ger and who at once called in two distinguished specialists. By these the case was pronounced hopeless, and they added, we now learn, that it would have been hopeless from the first and that medical skill could at no time have done anything to avert its fatal result. She was always devoted to her gifted brother, and their mutual affection never until now had been disturbed. The death of a beloved sister coming so soon after that of his loved and loving daughter must indeed be a crushing calamity to the Chancellor of the Exchequer. Lloyd-George attended to his duties in the House of Commons on the evening of the day when he had received the news of his heavy calamity, and his brave efforts to get thru his work there created, it need hardly be said, a feeling of the deepest sympathy among all the members present, a feeling only the more deep because it could not well find any public form of expression.

I have lately been renewing an old and much valued companionship in the person of Mr. William Leatham Bright, eldest son of John Bright, the great Liberal orator and statesman, whose name is

WILLIAM LEATHAM BRIGHT.

as well known and I feel sure as highly honored thruout the United States as it is in his own country, and, indeed, I may fairly say, thru all the civilized countries of the world. William Leatham Bright and I had been members of the House of Commons for many years together, and he and I voted in the same division lobby during the great struggle on behalf of Gladstone's Home Rule measure in 1886, when, as my American readers will recollect, John Bright withdrew from his support of Gladstone and when therefore the father and the son voted in separate division lobbies. William Bright withdrew from Parliamentary life before I had to do so, and thus it somehow happened that we were not brought into any manner of association again for several years. When I came for a prolonged holiday to Folkestone I found, to my great surprise, that William Bright had taken a house there and intended to make it a home for himself and his wife. So we met again and renewed our long interrupted acquaintance. As may easily be imagined, we have talked much about that Home Rule struggle and about the fact that he, as he himself put it, had fought under the banner of the Irish National party while the struggle lasted. He told me, too, of the pain it gave him to separate himself from his father in those most critical divisions on the Gladstone Home Rule measure. And he told me also, and I was truly glad to hear the statement from him, that his illustrious father had found no fault with him for the course he then pursued and had assured him that he quite understood and appreciated the motives which had impelled him to such a course. I may add of my own knowledge that John Bright never was opposed to the principle of national self-government for Ireland. But he was

opposed to any plan for the creation of several separate parliaments in the British Islands under the rule of the one sovereign. He had, however, always maintained the principle that if Ireland could not have her own national legislature she ought, nevertheless, to be allowed to pass by her own majority in the House of Commons such legislation as her national parliament would have carried if Ireland had accomplished a successful rev-

olution. This is practically the case at present with Scotland, for when the majority of the Scottish members set up and maintain any legislative scheme which applies to Scotland only, it is always understood that the other members of the House of Commons do not oppose or interfere with any such measure of legislation.

Before I leave this subject, brought up by the renewal of my companionship with William Leatham Bright, let me add that one of the most treasured memories of my life is associated with John Bright's name. It is an established custom in the House of Commons that when any really distinguished member of the House passes out of this life the leader of the Government then in office, the leader of the Opposition, and the leader of the Irish National party shall rise successively and offer their tributes to his praise. At the time of John Bright's death, at the close of March, 1889, it became my duty, in the casual absence of Mr.

GEORGE ALEXANDER
REDFORD.
Dramatic censor.

Parnell, to offer the heartfelt tribute of the Irish people to his genius, to his services, and to his friendship made manifest during many years at a time when Ireland had few other friends among England's conspicuous statesmen. The second son of the great patriot and orator, Mr. J. A. Bright, is still a member of the House of Commons. I very much wish that Mr. Wil-

ham Leatham Bright could be prevailed upon to return to parliamentary life, but he explained to me that his broken health during recent years gives him little hope of being able to bear the exacting toil belonging to the duties of a conscientious Member of Parliament.

The attention of the dramatic and the literary professions, and indeed I may say of the public in general, has been of late very much occupied by the work of the Dramatic Censorship Committee, lately appointed from the two Houses of Parliament, for the purpose of considering whether we ought to have a censorship of the drama placed, as it has long been, in the hands of one official, from whose decision as to what may or may not be presented on the public stage there is practically no appeal. I have no personal acquaintanceship with the present dramatic censor, Mr. Redford, and I can therefore offer no judgment as to his qualifications for such an office. I was indeed for a great many years an intimate friend of his predecessor, the late Mr. Edward F. S. Pigott, who was for a long time one of the literary staff of the *Daily News*, and was a very brilliant writer, more especially on literary and dramatic subjects. I remember well that an eminent Frenchman, belonging to the staff of the French Embassy in London, told me once that he had only known in the course of his career two Englishmen who spoke French so well that they might have passed as educated Frenchmen, and that these two were the late Lord Granville and my friend Pigott. From my own personal knowledge of Pigott's capacity and temperament I should think he, when appointed Censor of Plays, must have discharged his delicate duties with thorough capacity and excellent judgment. That, however, has not much to do with the question now at issue—whether there ought to be such a method of dramatic censorship at all—

a question on which I am strongly inclined to believe that Pigott would have given a distinct answer in the negative. It seems to me that there certainly ought to be some authority to decide as to what ought or ought not to be presented or represented on the public stage, but I think this ought to be a subject for the decision of some state official of high authority, such as the Lord Chamberlain for instance, and should be merely a question of morality and public decency, and ought not to be left to the final judgment of some literary man, whose opinions, for all we know, might be swayed by all manner of private and personal inclinations or disinclinations. This seems to be thus far the general opinion of the many authors, dramatic and literary, who have been giving evidence before the present committee. Under such conditions it might fairly be assumed that the decision of the Lord Chamberlain would be affected only by the consideration of what was due to public morality and decency, and not by any speculative opinions as to whether this or that figure or scene on the stage was exactly what the censor regarded as illustrative of the soundest artistic theories as to literary and dramatic expression, and if any injustice were done to this or that dramatic author or stage manager there would always be a responsible figure whose decision could be promptly called in question before one or the other House of Parliament, and thus before the general public. The whole question, however, is one of serious interest to the drama and to literature in general, and to that outer world which depends so much on the drama for its healthful amusement and for its mental elevation. So far as I can judge at present the opinion of authors and artists now does not seem to express much satisfaction with the existing method of dramatic censorship.

LOUIS FENNER

Literature

The Christian Doctrine of God

DR. CLARKE is the clearest, sanest and gentlest of living American theologians whose special field is doctrinal theology. His candor and sincerity are a moral tonic. He has the faculty of dealing with the problems one is actually puzzling over, rather than with some phase of the topic which is either perfectly clear or perfectly indifferent to a man of normal interests—the latter being the usual custom of commentators. He possesses genuine religious insight, and some of his pages are as full of visions and as exhilarating in outlook as a mountain sunrise when the wind blows from the north. His writings have clarified more confused minds and steadied more disturbed spirits than any other single personal influence in Great Britain and America for the past twenty years.

His present volume on the *Christian Doctrine of God** has been several years in preparation. Friends have known that the first draft was completed several years ago, and have awaited eagerly the results of careful revision and elaboration. The result is the crowning effort of a life spent in earnest search for vital truth on the highest themes of religion. It is a book which will enter current religious life as a sweetening and purifying influence, revealing to many the truths by which they have lived, but which they knew not how to state. It will make for faith, for wiser and deeper faith, and will instruct in method of approach to religious truth as well as convey large portions of the truth itself.

Dr. Clarke conceives his task to be to set forth the conception of God that is characteristic of the Christian religion. He does not try to prove the existence of God, but to portray the character of God as revealed in the Christian faith.

He makes no attempt to narrate the history of the various movements of thought in the long process of Christian theism. He takes his stand in the present, and inquires what we may declare of the divine being, in the light of what Jesus taught and what has been made of that teaching in the Christian centuries. He sets forth the character of God, His goodness, love, holiness and wisdom. He tells what is meant by personality in God, explaining why that assertion is necessary, but how it is liable to misunderstanding. On the relations of God to men, as Creator, Father, Sovereign, Moral Governor and Saviour, he tells us what is essential and reasonable in Christian belief. Under the general head of God and the Universe he treats of Monotheism, The Infinite, The Eternal, Transcendence and Immanence. Only at the conclusion does he approach the usual topics in which theistic argument usually finds its field, evidences for the Christian theistic belief and consideration of objections. Thruout the sustained discussion he is gently reasonable and kindly persuasive.

After the founder of the Christian faith had done His work, one of His most sympathetic disciples testified, "No man hath seen God at any time; the only begotten Son, which is in the bosom of the Father, He hath declared Him." One may say with perfect reverence that Dr. Clarke has risen to this eminently Christian method. Those who must hear of "scheme and plan," who will not believe except on demonstration, will not be convinced by anything Dr. Clarke has written; but it is no small service to make clear before willing eyes the fairest visions of the divine character which the world has known. It is true that this essay does not go beyond such a poem as Whittier's "Eternal Goodness" in description of the nature and attributes of God, but it is something to have a treatise in doctrinal theology which is as noble and as true as that poem.

*THE CHRISTIAN DOCTRINE OF GOD. By William Newton Clarke. New York: Charles Scribner's Sons. \$2.50

Austria-Hungary

THE neutralization, for the moment at least, of all the results of King Edward's "masterly" diplomacy by Baron von Aehrenthal's bold stroke in the Balkans, undertaken, we have been informed, without previous consultation with or notification of Germany, but with absolute reliance upon that country's loyalty to its ally (a reliance proved to be well founded after the event), gives added timeliness to the publication of Mr. Geoffrey Drage's *Austria-Hungary*,* an admirably clear, thoro and comprehensive work on the dual monarchy, its agriculture, industry, commerce and finance, its internal politics, racial difficulties, religious, social, economic and educational condition, together with excellent historical surveys of the different phases thru which the dual monarchy has passed in its attempts to "find itself," leading from the early Hapsburg policy of Austrian—i. e., German—supremacy to the present dualism, which, in its turn, may give way to federation. The empire-kingdom's unity is safeguarded, in the end, by the realization by all its component parts of the truth of the old saying, "United we stand, divided we fall." The "octad which is a unit," the "crazy quilt of Europe," is kept together by the strongest of all bonds, that of self-interest. It is but natural that in a work of such scope the international position of Austria-Hungary has not been neglected, and that the author has ventured to cast a look into that future which, in the course of human events, cannot fail to become ere long the present, under a young ruler whose hand has just been shown, in part at least, by the aged Emperor's Prime Minister.

Mr. Drage's book, which will prove of the greatest assistance to diplomats, parliamentarians, economists and newspaper men, is at the same time excellent reading for the interested layman, to whom the difficulties of Austro-Hungarian internal racial relations present themselves but too often in the form of an unintelligible chaos. Not less felicitous is the author's treatment of the monarchy's external affairs, whether it

be trade with Germany and the Balkans, or the present status and prospects of pan-Germanism, pan-Slavism, and of the claims of *Italia Irredenta*.

The international diplomatic aspect, the future course of Austria-Hungary as a factor in the policies of Europe, is the one which is uppermost in Mr. Drage's mind in the end. What will be the relation of the realm of the Hapsburgs to the Anglo-German crisis, which all Englishmen persist in drawing ever nearer, an inevitable, irrepressible conflict? Austria-Hungary is no longer an uncertain factor in international policies; the doubts as to her course under a new ruler have already been largely settled by the annexation of Bosnia and Herzegovina. The startling changes in Europe, threatening a general war, so freely predicted by political prophets during the last decade or so, will not take place on the death of Francis Joseph. Pan-Germanism will remain a theory whose political realization none will dare to attempt; Austria will not join the German Empire, nor will Hungary attempt to stand alone under a separate ruler of her own; and economic interdependence, the industrial and commercial self-sufficiency of the realm, will prove a power of cohesion as potent as that of national and international political necessity.

Mr. Drage ends his work with a brief survey of the general European outlook. The present danger-point, in his opinion, continues to be the Balkans. He quotes M. Hanotaux's recent *dictum*, in view of the financial burdens of the great nations of Europe, that "it is the stock exchange just now which is the *ultima ratio*," and may decide for peace, but it will be armed peace, the peace of standing armies and Dreadnoughts. Mr. Drage outlines Austria-Hungary's new naval program, which will give her, by 1915 at the latest, three or four Dreadnoughts (20,000 tons), three battleships of 15,000 tons, three of 10,000, three of 8,300, and three of 5,600—fifteen battleships, and in addition to these, three armored cruisers. This fleet will give the country the mastery of the Mediterranean.

Finally, Mr. Drage considers Great Britain's standing and prospects in Europe. Personally, he informs his

readers, he has always been "a believer in a good understanding with Germany," and will remain "faithful to that belief so long as the two-Power naval standard is scrupulously maintained by Great Britain," but *si vis pacem, para bellum*; the moment that standard is allowed to lapse, "the outbreak of war will depend partly on German nerves"—the world has been made uncomfortably aware of late of English "nerves," by the way—and "partly on the occurrence of a favorable opportunity." As for France and Russia, the one doubts her preparedness for war; the other knows that she is utterly unprepared. Mr. Drage does not say so, but what he does say comes to the same thing in the end: England can rely upon herself alone; her "partners" do not mean to fight for her, an *entente cordiale* being far from being an offensive and defensive alliance. He credits German industrials and merchants with a sincere desire for the continuance of peace, but he mistrusts the German Government. To the theory that that Government has become convinced that the victory can be won without firing a shot, by superior economic efficiency—a theory that is beginning to gain ground in Europe—Mr. Drage pays no attention. The course he advocates is plain: More British Dreadnoughts. They will undoubtedly be built, and be matched by more German Dreadnoughts, in addition to those of her ally in the Mediterranean, with France and Russia and Italy bravely struggling to keep up with the rivalry, until—who can foretell the end?

A Georgian Pageant. By Frank Frankfort Moore. With Illustrations. New York: E. P. Dutton & Co. Pp. iv, 346. \$3.50.

The days of the Georges were undoubtedly the most gossipy period of which the world has any record, and Mr. Moore has steeped himself to saturation in all the ancient gossip which the letter and diary writers of the period have left on record. Whether there was any need for a volume of the portly size to which Mr. Moore's pages extend to contravene justly forgotten statements about remembered and unremembered personages, or to rehabilitate the characters of some who suffered at the hands of the inveterate gossips of the eighteenth cen-

tury, may be left to be determined by any readers whom this kind of literature may attract. Even if Boswell did misunderstand Goldsmith and do his best to make him ridiculous, Goldsmith survived the treatment, and it hardly seems necessary for even the most zealous of his fellow-countrymen to take up the cudgels in defense of the author of "The Vicar of Wakefield" and "She Stoops to Conquer." But the most probable motive for the writing of this book was not the vindication of the fame of a fellow-countryman. It was rather Mr. Moore's desire for an opportunity to show his own cleverness. An example or two will suffice. Animadverting on the gluttony for which Dr. Johnson was notorious, and his patron, Mr. Thrale, almost equally so, Mr. Moore writes: "He [Mr. Thrale] usually fell asleep after dinner; one day he failed to awake, and he has not awakened since." Of Mr. Barretti, another protégé of the Thrales, Mr. Moore writes: "He was as detestable as he was learned—perhaps even more so. Learned men are not invariably horrid, unless they are men of genius as well, and this rarely happens." It may be safely left to his readers to decide whether this writing is clever and witty, or merely smart.

The German Drama in the Nineteenth Century. By Dr. Georg Witkowski. New York: Henry Holt & Co. 12mo. \$1.

This handy, compact, well-considered and well-balanced little treatise has been translated by Prof. L. E. Horning, of the University of Toronto, and deserves the attention of all students. The interest of the monograph for the American student of the development of the contemporary drama lies, of course, more especially in the pages devoted to the period 1885-1900, the era of the free theater in Germany, and of the blossoming and flowering of naturalism, whose chief fruits have been Sudermann, some passing minor figures, Max Halbe at their head, and the most interesting writer of all, Gerard Hauptmann, whose artistic destiny still lies on the faces of the gods. A neat bit of condensed criticism, by the way, is the paragraph devoted by the author to Julius Philipp, who *prend son bien au il le front*—

from Ibsen, Sudermann, Hauptmann, Halbe; all is grist that he can bring to his mill, which turns out only momentarily effective, hollow, theatrical effects, and nothing more. Thus far the serious main stream of contemporary German drama, its lighter rivulets of comedy, made familiar to us in translation from the days of "The Private Secretary" to those of "Countess Gucki," the vapid farces of which the American season now opening is destined to have its full share in translation and adaptation, the operetta, all this comes within the scope of Dr. Witkowski's book, as does also opera, from Mozart via Weber, Flotow, Nicolai, Bruehl, and a few others, to Wagner. The earlier chapters of the book have, from our distance, only an historic, a strictly German historic, significance. The tracing of the evolution is, of necessity, begun in the closing years of the eighteenth century; then follow the romantic period of 1800-1830, and the developments of 1830-1885, neither of them of traceable bearing upon the Anglo-American drama. Influences, national and foreign, are indicated with brief clarity, culminating, after a short apprenticeship to the French society drama, in a not always discriminating discipleship to Ibsen, Strindberg, Tolstoy; and, via literature, to Zola. Summing up, the author finds that in the German drama of the nineteenth century there is to be noted in its highest form—tragedy—"neither assured progress in matters of form nor an important increase in the number of possessions"; that the play of contemporary life and its problems has gained in flexibility of technique and range of permissible subjects, but that it is "so determined by the conditions of the times that it but rarely produces works of long life"—which, by the way, is the true explanation of the passing of the drama of the younger Dumas, whose social and moral problems no longer interest us; and that the *schwank*, the *posse* and the folk-drama offer "nothing but a picture of continued decay." In the field of the music-drama, Weber and Wagner, "it would seem, are not to be surpassed." As to the future, Dr. Witkowski refuses to venture prophecy; the literary tendencies he sees are summed up in Nietzsche, symbolism and

a new romanticism; the highest hopes of the German drama are at present centered in Hauptmann. A scholarly, informing and withal readable little volume.

English Literature in the Nineteenth Century. By LARNE MAGNUS. New York: G. P. Putnam's Sons. '82.

The aim of this volume, which the author entitles an essay in criticism, is to arrive at some sort of designation or characterization for the nineteenth century like those which at once designate and characterize other well-marked and completed periods of literature—the Renaissance, the Age of Reason, and so on. This etiquet or label the writer discovers in the Age of Emancipation, whose implication and significance he undertakes to bring out with reference to the period concerned by a comprehensive review of the various authors and their contributions. Such an attempt to survey critically a vast and partially unplotted territory is no less difficult than meritorious, and it is not astonishing that Mr. Magnus's performance should be rather unequal. On the whole, it may be said by way of general stricture, he hardly seems to be at the most advantageous point of view somehow. Not only is his formula too cramped; he is almost too much of the thing he criticises to be a thoroly safe critic. If he is not himself a partisan of the old Emancipation party—how like the thirties it sounds!—he is at least so thoroly a romantic sympathizer that he has some difficulty in seeing even the more obvious faults of the movement. In particular he has little or nothing to say of the inherent weaknesses of its promoters—of Wordsworth and Shelley—which have in a manner vitiated the constitution of their descendants. For him Peter Bell is "The true pendant to the Ancient Mariner." Of the latter part of his period, the Victorian Age proper, his discussion is more satisfactory. There is much in his criticism of Tennyson and the other men of yesterday to arrest attention. At the same time he is somewhat out of the way to reckon Meredith "among the greatest English poets," or to count Swinburne as the master of criticism. In addition it may be objected that the individual reviews are not al-

ways very closely integrated with the general theme. But after all the merit of the book consists in its *aperçus* and flashes of insight, which are at times exceedingly penetrating.

Literary Notes

....The latest of the personal magazinettes to come under our observation is *The East Side*, a peculiarly New York product, of which Zoe Anderson Norris, of 338 East Fifteenth street, is printer's devil, business manager, editor, owner, circulation liar and press agent. It is "published whenever the printer will stand for it."

....In connection with the Hudson-Fulton Celebration the F. A. Stokes Company are issuing a historical guide to the City of New York, compiled by the City Historical Club of New York and containing seventy maps and diagrams and forty-six illustrations. The book is dedicated to Gen. Stewart L. Woodford, and is indorsed by the American Scenic and Historic Preservation Society. (\$1.50.)

....In der in Neuyork erscheinenden Zeitschrift THE INDEPENDENT, werden in diesem Jahr beachtenswerte, reich illustrierte Artikel des Herrn Edwin E. Slosson über die Geschichte, Verwaltung, Studentengebräuche, Lehrkurse usw. einzelner Universitäten veröffentlicht, die um so mehr Aufsehen erregt haben, als sie von einem Unparteiischen geschrieben sind. Jeder Deutsche, der sich für das höhere Unterrichtswesen der Vereinigten Staaten einigermassen interessiert, sollte diese Artikel lesen.—*Internationale Wochenschrift*, (Berlin).

....In the past few years special libraries, in some cases a department of a prominent public library, but more frequently connected with large industrial concerns, banking and insurance companies, commercial organizations, and legislative and executive commissions, have been established in the leading cities of the United States. In this era of specialization, the creation of a library devoted exclusively, for example, to economics, to life and fire insurance statistics, to data as to trade and commerce, to rail and water transportation, or to real estate, has become a pressing necessity. These libraries, constantly increasing in number, size and importance, now find it desirable actively to co-operate. At the July conference of the American Library Association, which was held at Bretton Woods, the "Special Libraries Association" was organized, with John Cotton Dana, librarian of the Newark Free Public Library, as president, and Anna Sears, librarian of the Merchants' Association of New York, as secretary and treasurer.

....An unexpectedly delightful little book is Mr. Alfred H. Upham's *Old Miami: the Yale of the Middle West* (Hamilton, Ohio: Republican Pub. Co.) The cause of the writing and the publication of the volume is the centenary of the university, which fell in February of

this year of many centennial and multiple thereof, but it is its own excuse for being, and an ample one. Mr. Upham does not take the "Yale of the Early West" too seriously, and yet he more than suggests the dignity and significance of the foundation of this outpost of education, and the value of its services on what was then the selvage of our civilization. The book gives a series of pictures of the life of the students at Miami in its early days, of pranks and discipline, of societies and fraternities, of the coming of educational institutions for women to nestle under Miami's wings, and closes with chapters on the Civil War, whose conclusion brought the end of the first phase of the university's existence. Mr. Upham vividly glimpses a page in the life of the West that has already passed into history.

Pebbles

It was in the old days of legend that the dish ran away with the spoon. But we still have the cup that cheers.—*Puck*.

SHE WAS TOO QUICK

There were three at the little table in the café, a lady and two men.

Suddenly the electric lights went out, and the lady, quickly and noiselessly, drew back.

An instant later there was the smack of a compound kiss. As the electric lights went up each man was seen smiling complaisantly.

"I thought I heard a kiss," said the lady, "but nobody kissed me."

Then the men suddenly glared at each other and flushed and looked painfully sheepish.—*Cleveland Plain Dealer*.

NATHAN STRAUS, discussing the absurd difficulties that confront sanitists in their endeavor to pass laws compelling the pasteurization of milk, said:

"The legislators who oppose this law bring forward arguments about as weak as that of the Maine milkman.

"A lady, summering in Maine, said to her milkman severely:

"Look here, this milk of yours is half water and half chalk. What do you mean by advertising it as pure?"

"Madam," said the milk manufacturer, with reproachful dignity, 'to the pure all things are pure.'"

HE EXPLAINED

At a school one day a teacher, having asked most of his pupils the difference between an island and a peninsula without receiving a satisfactory answer, came to the last boy.

"I can explain it, sir," said the bright youth. "First get two glasses. Fill one with water and the other with milk. Then catch a fly and place it in the glass of water. That fly is an island, because he is entirely surrounded by water. But now place the fly in the glass of milk, and it will be a peninsula, because it is nearly surrounded by water."

The boy went to the top of the class.—*American Literary Review*.

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - New York

A WEEKLY MAGAZINE. FOUNDED IN 1848.

One Year, \$2.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, \$1.75 a year extra; to Canada, \$1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with \$1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

The Hudson River Show

THE commissions in charge of plans for the Hudson-Fulton Celebration have done their work well. They have provided for the tastes of all sorts and conditions of men. There will be Rembrandts for the artistic; concerts for the musical; receptions for the fashionable; lectures for the intellectual; banquets for the gustatorial; sports for the sporty; but for everybody, these and all the others, there will be the pageantry of the River.

For the oldest and most popular of spectacles is the procession. It is never out of fashion, the most orthodox of amusements, *semper ubique et pro omnibus*. As the people will gather on the Palisades the last of this month to watch the ships go by, so gathered they on the banks of the Nile and the Euphrates five thousand years ago. The "floats" of the street will most appropriately bear the signs of the long and honorable descent of this popular form of entertainment. The gods of Egypt and Scandinavia will again appear on earth; the athletes of Greece and the warriors of Rome will have another triumph; the Indians and the Dutch, the English, Irish

and Scotch, the Italians, Jews, French, Syrians, Danes, negroes, Colonials and red-coats, their descendants, impersonators and successors, the cosmopolites of the metropolis, will unite in the celebration as they have united in the making of the nation. There will be in this parade a suggestion of all the four types of pageantry which we Americans have chiefly developed—the fireman's, the circus, the Mardi Gras, and the Fourth of July processions.

The processional pageant is the most beloved of spectacles by the people because it is the most democratic. Thousands may participate in it and unlimited numbers may look on. Ticket speculators cannot monopolize the seats. The Four Hundred cannot revise the list of invitations; it will be open to the Four Million. The footlights will stretch a hundred and fifty miles and the proscenium arch is high heaven itself. The Palisades will serve as a back-drop in this, the people's theater, and there will be real water, real rocks, real clouds and real trees for properties; what is a more unique feature of the modern drama, there will be real air to breathe. All the four elements of which, according to the ancients, the world is composed will be utilized in different combinations for the various modes of locomotion. Men will travel by earth, water and air, and fire will propel them. The "Half Moon" will head the line, on water by the aid of air. The "Clermont" will follow, on water by the aid of fire. Paralleling them up Riverside Drive will be a continuous procession of automobiles, on land by the aid of fire. And overhead will fly Glenn Curtis and Wilbur Wright, in air by the aid of fire, the latest of the triumphs of mankind, the first time the third dimension has been brought into the procession.

As a method of teaching history to large classes, the pageant is unequalled. Seeing is believing. What eulogy of the courage of the discoverers of America can thrill us like the sight of this little sailboat, twenty-one paces long, in which Henry Hudson cruised these unknown seas in search of the Northwest Passage? When he ran into shallow water up near Albany he rightly concluded that he could never get to China

that way, so he went back and tried it again higher up next year, only to get into a worse *cul-de-sac* and be put to death. His sole reward was to have his name attached to the most beautiful river and the biggest bay in America. His life was a failure, so thought he and his contemporaries, but a glorious success say we, and so we celebrate. The Northwest Passage has since been found, but found not passable. The announcement of a polar sea on the eve of the celebration arouses only sentimental and speculative interest, no commercial aspirations. Yet it is singularly appropriate that we will have with us on this occasion Peary of the Pole. Shall we say Peary and Cook? No, certainly not, for if we are to use both names we must say Cook and Peary. Even in the days of Fulton it was remembered that this river was once thought the route to the Pole. As he steamed up the Hudson one of the jeering spectators shouted from the shore: "Bring us back a chip from the North Pole!" Fulton did not go so far, altho farther than the taunting skeptic thought he would, but now we are to have the Pole brought to us, on the "Roosevelt" if not on the "Bradley." Such a conflict of claimants is no new thing in the history of exploration. An enthusiastic editor of the *Cookite* faction last week wrote: "It is as certain that Cook discovered the North Pole as that Columbus discovered America or Hudson the river which bears his name." No doubt, but how certain is that? Columbus had his Ericson, Hudson had his Verrazano, and Commander Peary may profit by their example.

The polar regions are no longer an unknown world. No modern voyager could if he would venture on such a deed of high emprise as Hudson in the "Half Moon." But when Fulton started to go "up to Albany on a sawmill" he opened the way into a kingdom richer than Cathay. For the explorers in the world of applied science need set no limits to their ambitions. The "Half Moon" was only 63 feet long, the "Clermont" was only 150 feet, but when they go up the Hudson September 25, 1909, they will pass the river steamboat "New York," 340 feet long; the American battleship "Montana," 502 feet long, and the Cu-

nard liner "Lusitania," 790 feet long, while all around them will swarm swift motor boats, and above will be dirigibles and aeroplanes. The Age of Exploration is closing, but the Age of Invention has barely begun.

✱

Secretary Ballinger's Acquittal

PRESIDENT TAFT has so completely the judicial temper that he has been counted as destined to be Chief Justice of the Supreme Court. His decision, therefore, completely exonerating the Secretary of the Interior of all blame in the charges brought against him of complicity in the schemes of combinations of capital to get control of Alaskan coal lands and of Western water-power sites, will be generally accepted. The attack on Secretary Ballinger, supposed to be inspired by Forester Pinchot, was so much of an indictment that the decision of President Taft may be called an acquittal.

Those who have read an article in our issue of last week by Willard French on "The Seizure of the People's Water Power" will have a clear idea of what are the evils against which it is the duty of the Government to protect the people.

The President puts the defense very clearly and it seems convincingly. The facts being as given, Secretary Ballinger's record is stainless in these matters. As to the water-power sites, the facts are given as follows: A few weeks before the close of his term President Roosevelt by executive order withdrew 1,500,000 acres from public settlement. Secretary Ballinger learned from the Geological Survey that the most of these tracts were far away from rivers, and, following its information, he restored the whole for settlement, but withheld all filings and entries that might be made for water-power purposes. In a few weeks the department learned what were the tracts that had such water power and again withdrew them, amounting to 300,000 acres, leaving 1,200,000 for settlement. As a matter of fact not one single filing has been attempted on any one of the water-power sites since President Roosevelt's original withdrawal in January of 1909. It is further shown that the story told by ex-Governor Pardee, of California, and widely published, of 15,000

acres pulled up by a water-power trust in Montana is completely fictitious. The President further says that there are 50 per cent. more water-power sites withdrawn from entry under Secretary Ballinger than had been withdrawn when he entered office, while four times as much land has been restored to settlement.

These facts are conclusive, so far as water power is concerned. Apparently the only point left unconsidered, or, at least, unreported, is the nature of the 1,200,000 acres thus restored for settlement. Are they the highland forest tracts which properly might be a forest reserve? There are other things to be considered besides water power, and one is the conserving of the sources of water power, so as to maintain a steady flow, and that means the maintenance and control of forests; and for this we have a Forest Bureau.

The other charge, even more definitely made by Mr. L. H. Glavis, chief of the Field Division of the General Land Office, was that Secretary Ballinger gave countenance and help to the claimants to the valuable coal lands in Alaska. The President has been carefully over the documents and technical questions involved, and he finds that Secretary Ballinger's course has been correct, and that Mr. Glavis, in presenting his complaints to the President, withheld important and essential facts in favor of the Secretary of the Interior. The President therefore allows the Secretary to dismiss Mr. Glavis as disingenuous and disloyal to his superiors.

Herein, the facts being as given, Secretary Ballinger is exonerated. The only point we see not fully cleared up is the wisdom of the Secretary's order that the claims pending in the Land Office and undisposed of be pressed to settlement for the advantage of both the claimants and of the Government. Of these, 931 are of coal lands in Alaska, and of these thirty-three are of the Cunningham group. Mr. Glavis insisted that these claims were fraudulent, as they were based on the buying out of entries by dummies who had never seen the lands, and that time was required to secure the proof of collusion and conspiracy. Of course, the claims should be settled as soon as possible, with all due regard to

their justice. Whether Mr. Glavis was allowed time to secure evidence, and what has become of those claims, we are not yet informed.

Of course, we are very glad that the Secretary's course has proved ethically and legally correct. We also believe that Mr. Pinchot's persistence in protecting the nation's forest wealth deserves praise. If we have any fear in the questions involved, which are questions of policy as well as law, it is that men of exact legal training may not interpret the powers given to them under the laws quite largely enough, but many feel obliged to be bound to the narrowest interpretations. The Supreme Court has given us good lessons in this matter, showing how the public good requires liberal construction of the provisions of the Constitution.

Dunwoodie and Modernism

WE gave two weeks ago the last and most extreme pronouncement from the Vatican against modern science and learning. We have previously informed our readers of the refusal of Rome to approve the appointment of Dr. Hanna, of Rochester, N. Y., as Auxiliary Archbishop of San Francisco, because of charges of Modernism. A later development of the same sort deserves notice, inasmuch as the attitude of the Church to modern learning is of the greatest importance to the whole country.

At Dunwoodie, near Yonkers, is situated the seminary of the Catholic Archdiocese of New York. It is the heir of three previous attempts. The first was somewhere up the State; that was destroyed by fire. Next it was opened at Fordham. There the president was Dr. McCloskey, afterward Archbishop of New York and the first Cardinal of the Western World. His predecessor in the Metropolitan See, Archbishop Hughes, turned Fordham over to the Jesuits, and the city bought a good slice from them—seventy acres, we believe, and at a round price. Fordham ought to be a paying institution; and yet a short while ago the Jesuits raised a mortgage, running into the hundreds of thousands of dollars, upon it. There is a story current that the Jesuits have a custom to keep all their properties under mortgage, so that

in case of expulsion they will leave encumbered estates behind them.

Next the seminary traveled northward to Troy, where Archbishop Hughes, in conjunction with the bishops of the State, bought a defunct Protestant institute at Troy; the faculty were nearly all recruited from Belgium. Its first president, Dr. Gabriels, is now the Bishop of Ogdensburg. Perhaps the most important work of Archbishop Corrigan was bringing back the seminary to its present site at Dunwoodie. The property at Troy was turned over to the Christian Brothers, who made it into a school.

Archbishop Corrigan arranged with the Company of St. Sulpice, whose special task it is to train priests for the altar, to take charge of the new department. Dr. Dyer, at that time head of the philosophic department of St. Mary's Seminary, Baltimore, Md., was named first president at Dunwoodie, and with him were associated a bright galaxy of Sulpician scholars—Driscoll, a noted Orientalist; Gigot, who has written several advanced works on Scripture; Bruneau, the compiler of a Gospel Harmony; Mahoney, professor of dogmatics, and later on Havey, now president of Brighton Seminary, Boston, Mass. The Sulpicians were strangers to the New York clergy, but they soon won the respect and esteem of the diocese, for they stuck to their post, led the same life as the seminarians, and mingled not with the little ups and downs of diocesan life.

When, however, Dr. Dyer was transferred to the presidency of the mother seminary, St. Mary's, Baltimore, in succession to Dr. Magnien, deceased, difficulties soon arose. Archbishop Farley had newly succeeded Corrigan. On one side were the Sulpicians outside New York, and on the other their own men at Dunwoodie, supported by Farley. The upshot was that most of the Sulpicians left the company and became attached to the diocese of New York. Farley therefore had the seminary and the faculty entirely under his control. The whole controversy, chiefly a series of letters, has been printed *for private circulation* in a booklet by one of the parties. But Dunwoodie had apparently reached a period of peace, when lo! the specter of Mod-

ernism spread over it and charges were formulated in Rome against the faculty. It is not clear whence emanated these charges, but the Archbishop heard more of them from Rome than was agreeable. Under Papal orders every bishop is required to appoint a commission for the purpose of searching out all suspicions of Modernism in seminaries. But their help was not needed. Dr. Hanna's supposed heresy was reported to Rome by a fellow professor at the Rochester seminary; and there had been no secret of the sympathy of Dunwoodie with modern views. Indeed, it had started a review for the very purpose of supporting liberal teachings; but it was suspended when Modernism was condemned.

At any rate Archbishop Farley was frightened by what he heard from Rome, and he resolved on the removal of the leading members of the faculty. The names were given in the Catholic journals, but with the erroneous assumption that the removal was required by a general rule as to the right of those to teach who had left the orders. The Archbishop felt that these removals were required by Rome, and he made his peace and in union with other prelates bought the old home of Pius IX and presented it to Pius X.

But the Archbishop did not fulfil all his threats. He perhaps found that the professors had too many friends. He contented himself with removing the rector, Dr. Driscoll, a scholar of reputation, and leaving several others, whose names we do not need to give. Why should we pillory them as Modernists? The Archbishop made Father Chidwick, rector of St. Ambrose Church, but better known as the popular naval chaplain, president of Dunwoodie, and gave Dr. Driscoll the charge on Tenth avenue left vacant by Father Chidwick, possibly to his relief from theologic aspersions. The faculty, at the suggestion of the Archbishop, passed warm resolutions of praise for their retiring president.

It has been often declared that there is no Modernism in the Catholic Church in this country, which would be equivalent to declaring that there is nothing but Medievalism as crass as the decisions

of the Biblical Commission; just as it was declared that there is no Americanism, which would be a sad condition. The defeat of Dr. Hanna and the overturn at Dunwoodie, and we may add the removal of the ex-Jesuit, Cornelius Clifford, professor of ecclesiastical history, from Seton Hall Seminary, are among the evidences that things are not as bad as has been claimed. There would have been no such trouble under Leo XIII, and there will probably be relief under the next Pope. The light cannot be shut out long. Many are prudent enough to foresee the evil and hide themselves till the storm is overpast.

The President's Speeches

IF President Taft can accomplish what his speech in Chicago outlined, a radical reform in the practice of criminal law, it will be an achievement of untold importance and will make his a most notable administration. Mr. Roosevelt, whose eye was open to every reform that was within reach of his ken, could not have pressed this reform, for he is not a practising lawyer, but Mr. Taft has seen the evil and has felt the wrong of the present system, and has more than once attacked it.

The facts are as bad as he describes them to be. We have all seen murder cases that have occupied a month of the court's time and cost many thousands of dollars, in which cunning lawyers have worried or wearied the jury into acquittal of guilty men, men who would have received the death penalty if they had been poor men, but who escaped because their money could contrive and invent occasions for delay and excuses for crime which would overrule the judge and befog the jury. Hear what the President says:

"The administration of criminal law in this country is a disgrace to our civilization, and the prevalence of crime and fraud, which here is greatly in excess of that in the European countries, is due largely to the failure of the law and its administrators to bring criminals to justice. I am sure that this failure is not due to corruption of officials. It is not due to their negligence or laziness, tho of course there may be both in some cases; but it is chiefly due to the system, against which it is

impossible for an earnest prosecutor and an efficient judge to struggle."

If conditions are as bad as they are here described, and we do not doubt they are, it is the business of those organizations of lawyers who are devoted to the real achievement of justice to urge on our American Bar Association and our State Legislatures such reforms as will remove this crying evil. To be sure it is the lawyers who have developed the evil and have profited by it, but there are enough patriotic and honest men in the profession to devise and press the needed amendments of procedure. President Taft tells us, what has been often noted, that a trial which here will take weeks if lawyers are well paid, will be finished in England, and with equal protection of justice, in two days. But there the judges have power to control the proceedings before them, to rebuke and restrain counsel, and to help the jury as to facts as well as law.

This is no reform to be accomplished "between the acts"; it will take a long time, but Congress can, after careful consideration, so lay down rules for Federal courts as to provide an example and norm for State courts. If the President will put his legal mind, and that of his distinguished advisers, to this task and not fear to make his influence felt in getting it enacted into law, he will deserve the everlasting gratitude of many a poor man unfortunately brought for trial. If these reforms should drive some able lawyers into a less lucrative kind of practice, and some disreputable men into the primitive labor of tilling the ground, the world would be better off. One recalls that the head of the most famous firm of criminal lawyers in this city was not so long ago sent to prison for proving too "smart" in his legal practice.

In a subsequent speech, in the very domain of the "insurgents," the President both criticised and defended the new tariff law. He said that the woolen schedule is bad, and at the same time he said that on the whole the act makes a reduction in rates and so measurably keeps the promise of the Republican platform. To veto the bill would have been unwise, and now we may expect the tariff to stand unchanged for some years, for

fresh amendments would, he says, greatly disarrange trade. We agree that he did right in signing the bill, and we do not expect speedy revision. Certainly in some schedules, and those of importance chiefly to manufacturers who want cheap raw materials, there has been a considerable reduction, in good part thru the intervention of the President, but we fail to see any such considerable relief as the party pledge promised. The trouble is that the new tariff, like the old, was constructed not to benefit consumers but to benefit manufacturers; to raise the price of commodities for the help of the seller, and not to reduce the price for the benefit of the consumer. The ultimate end of all trade and business is the advantage of the consumer, not of the producer, altho both are to be helped together. We have now very far from a scientific tariff law, and shall not have until our new tariff commission has been long at work.

The President is now in the realm of his tariff critics, Republicans as well as Democrats. His addresses on this subject will be closely studied and will not receive perfunctory praise. All must admire the frank boldness with which he takes the people into his confidence and says plainly what he believes. For this we admire him.

A Brother to All Women

DURING the same week that Mr. Harriman died, Henry B. Blackwell passed away in Boston. The newspapers of the United States contained thousands of columns concerning Mr. Harriman, and there was scarcely one of them which did not print an editorial on his death. The death of Mr. Blackwell passed practically unnoticed outside his own city. Mr. Harriman accumulated \$100,000,000 during his lifetime. Mr. Blackwell merely devoted a life of eighty-four years to the promotion of human freedom.

Mr. Blackwell was the best friend that women as a sex ever had among men. Other men have helped individual women. Other men have helped women as a sex very greatly on occasions. But Mr. Blackwell was the only man who ever gave up his whole mature life to elevating and improving the condition of women before the law. The devotion of one

man to one woman has formed the motive theme of a very large part of all creative literature. The devotion of one man to the welfare of the sex may reasonably receive a brief notice.

When Mr. Blackwell and Lucy Stone were married in 1855 they published a joint signed protest. In this they stated that upon assuming the marriage relation they protested against the existing marriage laws of the United States, especially the following: The laws which gave the husband the custody of the wife's person, the exclusive control and guardianship of their children, the sole ownership of her personal and use of her real estate, the absolute right to the entire product of her industry, a much larger and more permanent interest in the property of a deceased wife than they give to a widow in that of her deceased husband, and, finally, against the whole system by which the legal existence of the wife is suspended during her marriage.

When Mr. Blackwell married in 1855, with the exception of the power of life and death, he found himself endowed with practically every power over his wife which the Roman husband possessed 2,000 years and more ago. In the one-half century since then this condition has been very largely swept away in the United States and replaced by the American system, which in a general way recognizes the married woman as an individual before the law, with all the rights and responsibilities of other individuals. Generally speaking, an American woman no longer assumes the legal condition of a minor when she marries. She now retains very largely any rights she may have possessed before. This is due to Mr. Blackwell more than to any other one man.

Mr. Blackwell, then a man of twenty-eight, made his first woman suffrage speech in 1853, five years after the general movement was started. His labors for that cause have never ceased since that day. He was one of the original founders of the first national suffrage association, and of the *Woman's Journal*, the first permanent suffrage publication in the United States, which he had conducted since 1870. His editorial in the issue of that paper which followed his death was the last of a continuous series

extending over forty years. Thruout all those years he traveled indefatigably over the entire United States, without a dollar of salary and generally at his own expense, lecturing and organizing for suffrage. A lifelong Republican of prominence, he introduced suffrage resolutions in scores of Republican conventions, and secured their adoption in some. His work was so intertwined with that of others who were working with him that it is difficult to differentiate. But, while many women were working thruout that period, and while they had many helpers among men, he was the only man who never abandoned or slackened his efforts.

When Mr. Blackwell made his first suffrage speech in 1853, women could not vote anywhere except in municipal elections in Sweden, and school elections in Kentucky and Ohio. Today women have full suffrage in Wyoming, Colorado, Idaho, Utah, Norway, Finland, New Zealand and Australia. They have municipal suffrage in England, Scotland, Ireland, Canada, Kansas, Denmark, Iceland and several European cities. They have school suffrage in half the States of the Union, and tax suffrage in Iowa, Montana, Louisiana, Michigan and the greater part of New York State. During these fifty-six years there has been more advance in the educational, industrial and property rights of women than in the entire history of the world before that time. Mr. Blackwell, at the end of his long life, could look upon this and say, "All of it I saw and part of it I was."

He was a man of infinite kindness in private life. Poor old huns and dead beats, men who were "down and out," found him out and haunted him. Poor, miserable widows and working women who had been cheated and imposed upon went to him for advice and help. Movements against Armenian massacres, Russian despotism, American deportation of political refugees—every form of human tyranny—sought his aid and endorsement.

The Arabs have a beautiful expression by which they describe a man of singular purity and uprightness. They call him "a brother to all women." Mr. Blackwell was a brother to all women. They will remember him long.

The Two Explorers

The two explorers are to be in New York this week. There is little to be added to what has already been said. The impression still prevails that both were successful in reaching the Pole, exactly as they claim, and that a certain natural, tho hardly pardonable, disappointment and jealousy at being forestalled accounts for Commander Peary's readiness to refuse credit to Dr. Cook's achievement. Commander Peary's brief record of his excursion to the Pole has been published and carries conviction, while Dr. Cook's is appearing in deliberate instalments in the *New York Herald*, and will take we don't know how long to reach the crucial records of the approach to the Pole. Every part of Peary's account agrees with what had come from Dr. Cook, and so far accredits it. We take it that Dr. Cook's delay in publication is fairly accounted for by the fact that he must make it pay his expenses, as he is not on a Government salary. At first it was reported that Commander Peary took with him but one Eskimo on his last marches, which allowed him even less corroboration than Dr. Cook, who took two. But the interview with Henson, Peary's colored attendant, shows that Henson and two or more Eskimos were with Peary when he reached the Pole, and all shouted together. We trust that there is some mistake in the report of an interviewer that Commander Peary gave as the reason for sending back all his white companions, "Because after a lifetime of effort I dearly wanted the honor myself." It would not have reduced his honor to have taken a companion with him.

Cook's Front Teeth

Dr. Cook's report of his polar trip is being scrutinized by the higher critics as ever were Holy Writ. Some question the evidence of his own mouth, the gap in his jaw which he claims was due to a fight with a polar bear, for, they say, polar bears are either too cowardly or too ferocious to engage in a boxing match that results in nothing worse than the loss of two teeth. One newspaper announces its willingness to receive subscriptions to finance an expedition to go

in search of those front teeth as corroborative evidence of his story. But in the meantime to satisfy our curiosity as to the habits of polar bears we turn to Nansen's story, "In Nacht und Eis," and two lively encounters come to hand at once, illustrated (I, 256, and II, 185), the latter an unprovoked attack in which Johanssen "hatte einen Schlag hinter das rechte Ohr bekommen, dass ihm die Funken aus dem Augen stoben—" and the other a jolly account of "ein kleines, mageres, einjähriges Thier" that took Peder Hendriksen a bite in the hip, and made an end of three dogs in succession, before he was given a quietus by four men frantically trying, one and all, to get their guns thawed out (weil sie "voll gefrorener Vaseline waren"). "Das war ein hinterlistiger Teufel von Bär," says Nansen, "trotz seiner Kleinheit." If Cook can tell as good bear stories as Nansen he deserves some credit from a skeptical world.

Creole or Mulatto In a review in our issue of August 26, of an English book on slang terms, we noted that the author made the *creole* to be a *mulatto*. On this matter Charles K. Needham, of New Albany, Ind., sends us proof that certain mulattos are called creoles in Mobile. He says:

I spent the first three months of 1909 in the city of Mobile, Ala. I had occasion a number of times to use the city directory, of which there were two kinds at my disposal; one, published by the firm R. L. Polk & Co. (having head offices at Columbus, Ohio, and making a specialty of directories of cities not exceeding say 100,000 inhabitants); the other was issued by a local house in Mobile—Delchamps is the name, I believe—and it differed from the Polk directory in one respect. The men in the employ of Polk & Co., following the custom in Southern cities, divided all names into two divisions, "White" and "Colored," including in the latter class all persons who showed clearly to the enumerator any proportion of African blood. But in the Delchamps directory there was a threefold division, namely, "White," "Creole" and "Colored." This was to me something new, altho I have been a visitor or resident in the South nearly all my life. I had been taught and had learned from personal conversation with persons in New Orleans how the word *creole* is used in Louisiana, yet I soon perceived, on comparing some of the persons with the many names given in Delchamps' directory, that the Mobilians attached to the word another meaning. The quotation given in the Standard Dictionary from Geo. W. Cable, "His whole ap-

pearance was a dazzling contradiction of the notion that a creole is a person of mixed blood," does not apply in Mobile, where the number of creoles is nearly equal to those known as "colored," and yet Mobile is only 140 miles from New Orleans.

Without taking special pains to investigate, I learned that in the Mobile region the colored people are exceedingly clannish. A large proportion of those who show they are not of pure African descent claim that the only admixture of European blood was by Spanish or French fathers years ago, and that such unions had the blessing or sanction of the Roman Catholic Church at some time during the life of the father or mother. The more extreme of the Mobilian creoles (who are all Catholics) claim that there have never been any illegitimate children in their ancestry, and they therefore hold themselves superior to the negroids—even those of lighter tint—who are about them. There is nothing, however, which will enable a stranger to distinguish in outward appearance between one of these Mobilian creoles and a mulatto, quadroon or octoroon of the ordinary kind. As a white man said to me: "For us they are all niggers." But to meet the deep seated feeling which exists in the minds of these people, and which is kept alive by the teachings of the church that they attend, the local editors of a directory have been willing to maintain a separate classification year after year.

Mr. Harriman's Will A credit to womankind, and no less to masculine faith and fealty, is Mr. Harriman's will, executed six years ago, and leaving his entire estate to his wife and making her sole executrix. He believed her worthy of absolute trust, her judgment as well as her purpose. He left five children, three of them of age and one married, but they are not mentioned in the will of less than a hundred words; their interests are wholly confided to their mother. Her property was of great advantage to him when he began his career. He trusted her judgment and took her advice for his largest business transactions, and he believed her capable to manage his railroad properties. A higher compliment could not be imagined, for it concerns intelligence, judgment and loyal integrity. Of course, the children will not suffer. And yet many another millionaire may have acted with wisdom and all proper consideration who has simply given his widow her third part of the estate, or have made generous provision for her home and maintenance; but Mrs. Harriman receives distinguished honor.

The following letter from
A Kindly Act William E. Barton, D.D.,
 of Oak Park, Ill., tells a
 kindly story and preaches a short lesson:

Some months ago I made request thru your columns that picture postal cards be sent to a friend of mine in prison. May I now be permitted to thank those who responded to that request and to say that it will not be necessary to send any more? The gentle, kindly man to whom the kindness was extended, has been released, and is doubly free; he died a free man.

Friends who sent him postal cards without knowing his name will be interested in knowing that there came to him thru the mails 1,600 illustrated postals, from every part of the world, and that he found great satisfaction in arranging them, and that every one of them touched his heart with a sense of the kindness of unknown friends. It is something to have brightened the last months of a life as those did who remembered him in bonds.

As his name was not mentioned before, let it still rest in the silence of this quiet ministration. But let me preach this little sermon to men who are trusted as he once was trusted, and honored as he once was honored: Keep trust funds separate from your own money. It is a very simple sermon, but for lack of following its direction some kindly men, generous and good, have learned bitter lessons.

Dr. Barton also tells us that he has received from Dr. D. K. Pearsons, of Chicago, the offer of \$100,000 for Berea College dependent on the securing of \$500,000. The trustees have just achieved the impossibility of the same amount for the colored industrial annex to Berea to be established somewhere in Kentucky, and certainly the mother college needs and deserves the additional endowment desired. This is the last gift which Dr. Pearsons will make under his resolve to give all his fortune.

Institutions for the education of colored youth are generally stingily financed because the race is yet poor, and the rich white friends are few—and, particularly, a colored college in the North receives little attention. President Scarborough of Wilberforce University, Ohio, must have been almost as much surprised as gratified when Mr. Carnegie, with his inclusive beneficence, offered to pay half the expense for a \$35,000 dormitory for girls when the rest is secured. Wilberforce is a most worthy institution, conducted wholly by colored people, and we

trust that a much larger sum can be raised for endowment. The sum would seem very modest for a white institution.

Three races, Caucasian, Eskimo, African, stood together at the Pole where since the world began no human foot had trod before these last achievements. Of all creatures only man can endure either extreme of cold or heat, and no matter what his race. It has been said that the negro must be confined to the hot climates, but the case of the negro, Henson, proves what has needed no proof since the race fled from our Southern States to Canada.

The German Social Democratic Congress in Leipzig last week voted to demand an equitable division of the electoral districts, and three instead of five years as the term of the Reichstag, and also opposed indirect taxation. There is no dangerous Socialism in these demands. They also refused to condemn those of their number who had voted with the Liberals. That shows a sense of practical politics.

For an incredibly awkward, but true, statement read the following written of Gladstone and Lord Rosebery at the time when the two were harnessed together for Irish home rule:

"The effusive humanitarianism and theological fanaticism of the one was antipodal to the fastidious cynicism and languid agnosticism of the other."

We commend it to teachers of rhetoric as an awful example.

There is a town in Oklahoma named Taft, inhabited solely by colored men. When two white men came there to settle they were received with warning placards that they would remain at their peril. That is the following of white men's bad example. Negroes should know better.

The North Pole, which the "Roosevelt" is bringing back, seems to be an Ananias Club.

The Pole this week is hotter than Central Africa.

The Hudson-Fulton Celebration and the Fire Hazard

THE present week is one of local celebration and of decoration. Flags are flying and bunting hangs in streamers and festoons here and there. Everywhere in Greater New York there is a striving after new and novel decorations and decorative displays in honor of Hendrick Hudson and Robert Fulton. In this connection the New York Board of Fire Underwriters has issued the following warning:

HOLIDAY AND OTHER DECORATIVE DISPLAYS NOT APPROVED BY FIRE UNDERWRITERS.

Your attention is hereby respectfully called to the fact that the introduction about premises of dried and imitation leaves and flowers, harvest specimens, similar decorations and other inflammable materials, and the use of moving picture machines, introduces an additional hazard not contemplated by the underwriters in issuing policies of indemnity covering the usual fire hazard; and in this connection we refer you to one of the conditions of the standard form of fire insurance policy, wherein it is stipulated that:

"This entire policy, unless otherwise provided by agreement indorsed hereon, or added hereto, shall be void, etc., etc.—if the hazard be increased by any means within the control or knowledge of the insured."

So many disastrous fires have occurred, not only in mercantile establishments, but in churches, public buildings, etc., caused by the introduction of such decorations and exhibitions, and the danger to life and property is so great, that the practical prohibition of this class of display is deemed necessary by the New York Board of Fire Underwriters.

Electric display, where motors are used, and where electric currents are shunted or broken on different circuits for advertising purposes, will not be approved by this board unless the devices for motive power and for the shunting and breaking of currents on different circuits are installed in a fireproof inclosure and the entire apparatus in connection with such displays is specifically approved by certificate obtained from the electric department of this board on application, with details filed with the board at least ten days in advance of the time for using such displays.

Attention is also called to the fact that fire insurance contracts require all additions, alterations and changes made in electric equipments, after certificates have been issued, to be reported to and approved by this board.

The late Edward H. Harriman, master builder of railroads, who died last

week, years ago took a \$50,000 deferred dividend endowment policy with the New York Life Insurance Company and matured it. Does not this act on the part of Mr. Harriman suggest something to the uninsured reader?

THERE are some of us who get considerable pleasure in the world out of driving. There is something of inspiration, something of stimulation in holding the driving lines over a good horse. This is true of driving in the city or along well made country roads. In the latter case the joy of it is intensified by the growing crops, the birds, the flowers, the brooks and streams, the trees, which all lend something of enchantment to driving. Many persons drive horses, both in and out of the city, for pleasure as well as business, and the percentage of accidents connected with so doing has not seemed very great. The Travelers Insurance Company, of Hartford, Conn., is not content, however, to let those of us who love to drive do so without warning us of the danger to which we are liable. In calling attention to the need of insurance protection in this regard the company gives some figures that go to show that the horse, and particularly the driven horse, is the most dangerous animal in the world. In a recent circular issued by the Travelers, it says:

"Owners do not sufficiently realize that the use of horses and vehicles is dangerous and hazardous. This hazard has materially increased in recent years, as traffic in cities becomes more congested, and as a result of the advent of trolley cars, automobiles, motorcycles, elevated trains and asphalt streets. Not less than twelve out of every hundred mishaps involving physical injury, are caused directly by the use of horses. Runaway horses each year in the United States kill about 4,500 people, and injure about 17,000. A runaway horse for the time being is mad with fright, and wholly insensible to pain. No bit devised will stop him, that being left to the electric light pole or the plate glass window, which may incapacitate him for further mischief, but on the way he may kill or injure many people, and the owner not only loses his horse but may have become legally liable to others in large amounts for the damage he has done."

FINANCIAL

ROBERT S. LOVETT

Vice president and general counsel for the Union Pacific Railroad Company, was at a meeting of the board of directors of the company, held last night, called for the purpose of electing a successor to the late E. H. Harriman. Mr. Lovett was born in a farming family, Texas, June 12, 1854. In youth he worked on his father's farm and his education was obtained in the public schools of his home town and at Houston. This was supplemented by private instruction and self-education. He began his career as a station agent of the Houston, East & West Texas Railroad and afterward studied law while acting as freight clerk for the road at Houston. He was admitted to the bar on December 22, 1882. He became local counsel of the road which had first employed him. Eventually he became general counsel of the road and finally general counsel of the Texas & Pacific. His firm afterward represented the Southern Pacific and affiliated lines, commonly known as the Harriman System. Mr. Lovett came to New York three years ago. He is president of the Houston & Texas Central Railroad Company. In banking and other matters he is regarded as a shrewd, soundly educated man. He is a member of the Lawyers' Club of New York and of the Houston Thalian, of Houston.

The Independent

VOL. LXVII NEW YORK, THURSDAY, SEPTEMBER 30, 1909 No. 3174

Survey of the World

Mr. Taft on
Railroads and Trusts

At Minneapolis the President welcomed to this country the Japanese commission of fifty-three men who have come to study American commercial and industrial methods. In this commission are seven members of Parliament, prominent physicians, attorneys, and representatives of Japan's banking houses. In the course of his remarks, Mr. Taft spoke of his six visits to Japan, commended the Emperor as "a warm and sincere friend of the United States," and declared that at the time of the recent controversy concerning Japanese immigrants, no one who knew what the facts were believed that there could be any quarrel between the two nations. Our newspapers, he added, sometimes sought to increase their circulation by stirring the emotions of our people. The subject of his address in Des Moines was the recommendations he intended to make for the amendment of the Interstate Commerce and Anti-Trust laws. The Railroad Rate law had been in operation, he said, for about three years, and it had "not furnished the relief against unduly discriminatory rates with the expedition and effectiveness which were expected." Delay was caused by litigation over the Commission's orders. He was strongly inclined to favor the establishment of an Interstate Commerce Court of five judges, which should be the only court to hear petitions for setting aside the Commission's orders. But there should be provision for appeals to the Supreme Court. The Commission should be empowered to entertain complaints against unjust classification of merchandise for transportation, and also to order the postponement for thirty days of the enforcement of a new rate classification, in order that the public might have an opportunity to

procure the investigation of such rates before they went into effect. The Commission should also be authorized "to suspend, modify or annul any changes in rules and regulations which impose undue burdens on shippers," to compel connecting carriers to unite in forming a thru route (with an apportionment of charges), and to prescribe rules under which shippers should have a right to designate a route for their goods beyond that of the first carrier.

"Another most important amendment of the Interstate Commerce law—part of which was specifically promised in the platform—is a prohibition against any interstate railroad company acquiring stock in any competing railroad in the future, and a further provision that no railroad engaged in interstate commerce shall, after a certain date, hold stock in a competing railroad, and the further amendment that after the passage of the amending act no railroad company engaged in interstate commerce shall issue any additional stock or bonds or other obligations, except with the approval of the Commission, based upon a finding by the Commission that the same are issued, first, for purposes authorized by law, and, second, for a price not less than par for stock, and not less than the reasonable market value for bonds, such price being paid either in cash or in property or services, but if in property or services, then at a fair value thereof as determined by the Commission."

Thus we should "gradually abolish that evil which is involved in the union of competing roads by one road owning the stock of another," and prevent the watering of railroad securities. At the same time the roads should be permitted to make traffic agreements, subject to the Commission's approval. In this way the operation of the Anti-Trust law against such agreements would be prevented. Turning to this law, he said he was inclined to the view that the way to make it more effective was to narrow its scope, "so that it shall not include in its prohibition and denunciation as a crime anything but a conspiracy or combina-

tion or contract entered into with actual intent to monopolize or suppress competition in interstate trade." The law was weakened because it condemned contracts and other arrangements which were "actually innocent in their character." The real object of the law would be accomplished if its denunciation should be confined to combinations and contracts "made with intent to monopolize or partly monopolize interstate trade," or to suppress competition in such trade.

"It has been suggested that the law ought to limit its denunciation to those contracts in restraint of trade that are unreasonable. I do not favor any such limitation. It seems to be proposed to leave to the judges to decide what combinations and contracts in restraint of trade ought to be permitted to exist and to be enforced on general grounds of public policy—in other words, to have the court attempt to establish some lines between what are called good and bad trusts, as if the suppression of competition in some cases was a good thing and in other cases was bad. I cannot agree that any such distinction can be properly made. All combinations to suppress competition, or to maintain a monopoly in whole or in part, of interstate trade, are and should be, in violation of the Anti-Trust law and should be punished as such; and there is no room for the expression, reasonable or unreasonable, in this general view of the statute.

"If the statute were limited to combinations, conspiracies, and contracts to restrain trade with intent to monopolize interstate trade, or with intent to suppress competition therein, it would probably not include within it denunciation of the boycott against goods going into interstate trade, because such a boycott is a restraint against interstate trade with the intention to restrain it, but it is not a restraint of interstate trade with intent either to suppress competition or to maintain a monopoly of the goods with respect to which the contract is made."

He was opposed to excepting from the operation of the law any class of persons, such as laborers or farmers or lawyers. A provision excepting the trade union class "would be legislation of the most vicious character." It was true that if the change he suggested should be made, the labor boycott would probably not be included, and this result would be obtained "without class legislation at all." But the boycott could be reached in another way:

"I am in favor of this change because I believe that the ordinary action in equity by injunction in any place where the boycott is operative can effectively accomplish all the purposes that ought to be accomplished in the suppression of such an evil. On the other hand

to apply the Anti-Trust law for the purpose of suppressing evils growing out of the labor organizations is to take advantage against such unlawful labor organizations of the literal terms of a statute which probably was not intended to include that which judicial construction could not avoid including within its words."

It would probably be wise to establish an accusatory bureau in the Department of Justice to institute prosecutions for violations of the Interstate Commerce and Anti-Trust laws, and also to enlarge the scope of the Bureau of Corporations, "perhaps to maintain the registration of corporations and the investigation into their operation so far as interstate trade is concerned."

✕

Income and Corporation Taxes

In Denver, the President addressed a great audience in the Auditorium (where Mr. Bryan was nominated last year), and had for his subject the new tax on the net earnings of corporations. He pointed out that this tax had been brought forward (with the provision for an income tax amendment to the Constitution) as a compromise when the income tax amendment to the tariff bill "seemed quite likely to pass by vote of all the Democrats and a sufficient number of Republicans." It had been conceded that the proposed income tax would yield from \$150,000,000 to \$200,000,000, or much more than the Government would need, "if the tariff was to retain its general form." The Democrats favored it "with a view to substituting it for the tariff as an income-producing measure," and as something to be used against the protective policy. He saw another objection in the fact that such a tax had been pronounced unconstitutional. Moreover, a direct income tax "offers a premium upon perjury to those who are willing to conceal their income," and this is to the disadvantage of the conscientious. In England, an income tax of 10 per cent. imposed directly on individuals had yielded less than an income tax of 5 per cent. imposed as at present there—first, on the declared dividends of corporations; second, on rents before they leave the hands of tenants; and, finally, on the individual with respect to matters not covered by rents and corporate investments. The exemption of the interest fund for bonds was a de-

fect in our law, but to include this fund would be a violation of the Constitution. The bar preventing a tax on this interest could be removed by adopting the proposed Constitutional amendment permitting an income tax to be levied. He regarded the new tax as an equitable burden:

"Incidentally it will give the Federal Government an opportunity to secure most valuable information in respect to the conduct of corporations, their actual financial condition, which they are required to show in general terms in a public return. In addition the law provides the means under proper limitations of investigating fully and in detail their courses of business. Indirectly it would help very much in another tariff revision, whenever that shall come, because corporations engaged in business said to be affected by the tariff will have upon record in Washington their exact financial condition from year to year in the matter of their incomes, their expenditures and their debts."

While he opposed the levying of a general individual income tax except in times of great national stress, he desired the adoption of the amendment to the Constitution because the Government ought to have power to levy such a tax, and for the additional reason that the adopting of the amendment would permit the imposition of a tax on bond interest. Two years ago he had spoken of plans for distributing our great fortunes without using drastic confiscatory methods:

"It seems to me now as it did then that the proper authority to reduce the size of fortunes is the State rather than the Central Government. Let the State pass laws of inheritance which shall require the division of great fortunes between the children of the decedents and shall not permit a multi-millionaire to leave his fortune in trust so as to keep it in a mass; make much more drastic the rule against perpetuities which obtain at common law, and then impose a heavy and graduated inheritance tax, which shall enable the State to share largely in the proceeds of such large accumulations of wealth, which could hardly have been brought about save thru its protection and its aid. In this way, gradually but effectively, the concentration of wealth in one hand or a few hands will be neutralized and the danger to the republic which has been anticipated by a continuation thru generations of such accumulating fortunes will be obviated."

He did not think an income tax could be very successfully used for this purpose. In his opinion, the information obtained by means of the new net earnings tax "may be made a basis for further legislation of a regulative character, applicable only to those corporations whose business is so largely of an interstate character as

to justify greater restrictions and more direct supervision." — At Colorado Springs, the President spoke of the policies of Mr. Roosevelt, saying the present Administration was pledged to procure, if possible, legislation to "clinch the advance" in business standards which Mr. Roosevelt had set up. As the guest of Thomas F. Walsh, he rechristened the latter's fine estate, naming it Clonmel, after the owner's birthplace in Ireland. He said:

"The hardy immigrants from Tipperary and from every part of the Emerald Isle have come to the front in America as they deserve. There is no element, no strain, in our civilization that has manifested itself to be stronger, more enterprising, more shrewd in business, more stern in enforcing high moral principles than the Irishmen who come to this country to make it their own."

At Montrose he opened the floodgates of the great Gunnison tunnel, six miles long, which is to carry the waters of the Gunnison River thru a mountain to irrigate 140,000 acres of arid land in the Uncompahgre Valley. This is one of the greatest of the Government reclamation projects, and the cost of it will be \$6,000,000. At Provo, in Utah, he spoke briefly in the Mormon tabernacle, congratulating the people upon the evidence of their respect for the laws. At that point Chief Forester Pinchot joined the party and was greeted heartily by the President. Secretary Ballinger had been with the President for two or three days. The newspaper reports say that he did not speak to Mr. Pinchot. — On Sunday, the 26th, the President spoke in the great Mormon tabernacle at Salt Lake City, taking for his text the words, "A soft answer turneth away wrath, but grievous words stir up anger." His address, or sermon, was a plea for courtesy, politeness and mutual forbearance in everyday life.

The Power Site Controversy Gifford Pinchot, Chief Forester, has decided that he will not resign.

Authorized statements from him and the President were published on the 26th, at Salt Lake City. It appears that when the President wrote his long letter to Secretary Ballinger, exonerating him with respect to the Cunningham coal land claims and the withdrawal of water-power sites, he also wrote to Mr. Pinchot, saying:

I wish you to know that I have the utmost confidence in your conscientious desire to serve the Government and the public, in the intensity of your purpose to achieve success in the matter of conservation of natural resources and in the immense value of what you have done and propose to do with reference to forestry and kindred methods of conservation, and that I am strongly in sympathy with all of these policies and propose to do everything that I can to maintain them, insisting only that the action for which I become responsible, or for which my Administration becomes responsible, shall be within the law. I should consider it one of the greatest losses that my Administration could sustain if you were to leave it, and I sincerely hope that you will not think that my action in writing the enclosed letter to Secretary Ballinger is reason for your taking a step of this character."

In his published statement the President said he expected "to continue the Roosevelt policies as to the conservation of resources" and to ask Congress for such confirmatory and enabling legislation as would "put the execution of those policies on the firmest basis." He had assured Mr. Pinchot that the conclusions set forth in the letter to the Secretary "were not intended in any way to reflect on him." Mr. Pinchot defines his position as follows:

"I shall not resign, but shall remain in the Government service. I shall give my best efforts in the future as in the past to promote the conservation and development of our forests, waters, lands and minerals and to defend the conservation policies wherever the need arises. Especially shall I continue to advocate the control of water power supply in the public interest and the use of our institutions, laws and natural resources for the benefit of the plain people. I believe in equality of opportunity and the Roosevelt policies, and I propose to stand for them as long as I have the strength to stand for anything."

At Salt Lake City there was much evidence of bitter personal feeling, on the part of the Secretary at least, who declined to recognize Mr. Pinchot and avoided the entertainments which the latter attended. L. R. Glavis, whom the Secretary removed from office, tells the President that he does not regret making charges against the Secretary, and that he is about to publish the evidence, as to which, he adds, the President has been misled.

The Hudson-Fulton Celebration

A series of naval and land parades, festivals and historical exhibitions in commemoration of the discovery of the Hudson River in 1609

by Henry Hudson, and of Robert Fulton's invention of the steamboat in 1807, was begun in New York on the 25th, when a notable procession of water craft, starting from Governor's Island, passed up the Hudson on one side of a line of battleships, returning on the other side to a point where exact reproductions of Hudson's little "Half Moon" and Fulton's "Clermont" were formally presented to the commission in charge of the celebration. The line of battleships was nearly ten miles long, and in it were representatives of the navies of The Netherlands, Great Britain, France, Germany, Italy, Argentina, Mexico and Cuba. In the evening this parade was repeated, with a brilliant illumination of the ships and of many structures and streets in the city. A remarkable feature of this exhibition was the illumination of the great East River bridges by lines and festoons of electric lights. The ceremonies of the celebration are to continue for a week, and thereafter there will be similar festivals in towns on the Hudson above New York. In the great city on Sunday there were special services in the churches, and on Tuesday a parade and an historical pageant in Fifth avenue. Wilbur Wright and Glenn H. Curtiss are to make exhibition flights with aeroplanes. It is estimated that the number of visitors drawn to the city by the celebration exceeds 1,000,000.

Cuba and Porto Rico

The Cuban Government, possibly owing to admonition from Washington, has taken steps to prevent use of the United States mails by patrons of the new national lottery. Assurances have been given to the Post Office Department at Washington that the Cuban authorities will not redeem lottery tickets transmitted in the United States mails. That is to say, prizes will not be paid on tickets so transmitted. And all inquiries concerning the lottery from persons in this country, it is added, will be turned over to the postal inspectors. — The losses caused in Pinar del Rio by the recent cyclone are estimated at \$2,000,000. Ten persons were killed, hundreds of houses and barns were destroyed, and great tracts of tobacco were ruined. The Senate in extra session, has voted to authorize a loan of \$700,000 to the planters

and to appropriate \$100,000 for public works in the Province.—George R. Colton will be appointed Governor of Porto Rico, to succeed Governor Post, who recently resigned. Mr. Colton went to the Philippines as lieutenant-colonel of a Nebraska regiment. After the war he was made Collector of Customs at Manila. Later, he held a similar office in Santo Domingo. Returning to Manila, he became Collector of Customs for the Philippines. It is believed that he is well fitted by his experience and his diplomatic methods for the office to which he is to be appointed.—The leaders of the Unionist party in Porto Rico have failed to prevent the payment of the expenses of the insular Government under the new law of Congress. Judge Rodey has refused to grant the injunction for which they applied. He decides that the payments are being made in accordance with the requirements of the law. He also criticises the applicants for attempting to

embarrass the Government. It will be recalled that the Unionists refused to make appropriations for the current year, and that on this account the law in question was enacted.

The Cook-Peary Controversy

The dispute as to priority of discovery of the North Pole has reached an acute stage thru the receipt of messages from Harry Whitney, at Indian Harbor, Labrador, stating that Commander Peary did not allow him to bring back the instruments or anything else belonging to Dr. Cook. This is a serious embarrassment to Dr. Cook, because, as he states, part of the original records of his observations were left with Whitney at Etah, and while he has part of the originals and copies of all with him, his observations cannot be corrected until the instrumental error has been determined. Mr. Whitney says that Dr. Cook intrusted to him his sextant, arti-

Photograph by Paul Thompson, New York

THE "HALF MOON."

As the vessel appeared on Saturday last while being conveyed up the Hudson by United States sailors in the naval parade.

found horizon under, and the flag which he flew over the Pole, and gave him the sledge which he had used on this trip. Mr. Whitney expected a ship to come for him, but as this did not arrive, he asked permission to return upon the "Roosevelt." This Commander Peary granted, but on condition that he give him his word of honor not to take on board anything belonging to Dr. Cook. Mr. Whitney therefore had to unpack the flag, instruments and boxes of Dr. Cook and leave them in a cache at Etah. Mr. Peary admits that he refused to allow any of Dr. Cook's boxes to be brought back on the "Roosevelt," but does not believe that Dr. Cook would have left such priceless things as his instruments, records and flags with a stranger when he could just as well have taken them with him on his sledge journey across Melville Bay to Danish Greenland. Mr. Whitney states that Dr. Cook asked him not to say anything to Peary about his reaching the Pole, but to tell him that he had beaten Peary's former record for farthest north. Dr. Cook's two Eskimos were also instructed not to inform Peary of their achievement. It will probably not be possible for a ship to make Etah until next summer to bring back the instruments, records and Eskimos in confirmation of Dr. Cook's story. Dr. Cook on his arrival in New York on board the "Oscar II" was given an enthusiastic but unofficial reception in New York City. His narrative of his expedition as now running in the New York *Herald* gives an interesting picture of Eskimo life, but so far contains little scientific data. "The "Roosevelt" on its arrival at Sydney was received by immense crowds and all possible honors shown to Commander Peary.

Land Tax or Tariff

The political situation in England has become clearer during the week thru the more definite alignment of the parties and formulation of the issues of the coming campaign, which now seems imminent. The speech of the former Liberal premier, Lord Rosebery, was chiefly devoted to an attack upon the Government finance bill as socialistic and revolutionary, and he did not concern himself with other methods for raising the necessary revenue but merely advised greater econ-

omy. The former Conservative premier, Arthur Balfour, has now supplemented this negative criticism by presenting the adoption of a tariff as the positive side of the policy of the Opposition. His speech was delivered at Birmingham, the home town of Joseph Chamberlain, the first British political leader to advocate the abandonment of free trade. The veteran and disabled leader listened to the speech from his home thru the electrophone. A letter from him was read and his son, J. Austin Chamberlain, occupied the chair. Mr. Balfour said that the country must now decide whether it would take the downward path that leads to Socialism or enter upon the upward forward movement of tariff reform. American readers must bear in mind that the phrase "tariff reform" in England means the opposite of what it does with us. Mr. Balfour said that the proposed legislation would undermine British industry by driving capital from the country. The capitalist could now place his money in any country where he could employ it with most profit, and foreign workmen would gain at the expense of British. Great Britain was losing its industrial supremacy and in some lines had already sunk to second or third place. While America was building up the greatest commercial empire the world had ever known, and while Germany, with unexampled, almost staggering success had promoted the growth of her own industries, and thru the partial, unequal working of the "most favored nation" clause had become the center of the mid-European body, commercially armed against British competition, it was amazing, even contemptible, that the people of this country should sit by with folded arms, hiding themselves behind the antiquated free trade formula, and watch those empires forging the weapons with which they were going to capture Great Britain's colonies from her sphere of commercial influence. The meeting concluded with the adoption of a resolution "recognizing that the financial proposals of the Government are intended to postpone indefinitely the policy of tariff reform this meeting declares its determined adherence to that policy as a necessary means of increasing employment at home and strengthening the empire at large."

This definite adoption by the Conservative party of a tariff policy has hastened

the time of a general election. The Liberals would be able to make a strong appeal to the country at this juncture with the time-honored principle of free trade threatened and with the House of Lords blocking all their efforts at progressive legislation and even usurping the constitutional privilege of the Commons by interfering with the budget bill. Home Secretary Gladstone stated that if the Lords refuse to pass the bill the Government would immediately appeal to the electorate, not only for the budget in its entirety, but for free trade and a change in the constitution of the upper house. What action the Lords will take is not yet known. It is expected that the bill will be sent to them about the middle of October, and if the House of Lords rejects it, lays it on the table or amends it in any important particulars, a general election will be promptly called. In the meantime the bill is having some difficulty getting thru the House of Commons. The Irish members bitterly opposed the clause taxing whisky as doing an injustice to Ireland by crippling one of its important industries. They also protested against the tax on the sale of gasoline because it would curtail motor touring in Ireland, which was bringing a great deal of money into the country. In the voting on September 24 the Government majority was, on account of the defection of the Irish, cut down to 18 and even to 13.

The Spanish in Morocco The Spanish forces under General Marina have been on the aggressive during the last two weeks and are reported to have achieved some important successes. In the first attacks the Spanish troops were forced to give way under the charges of the Moorish cavalry, but later an advance movement inward from the coast was made at various points along the railway reaching from Melilla to the mines at Zeluan. A captive balloon was used to direct their movements. Mount Gurugu, the stronghold of the Riffians, is now invested on three sides by the Spaniards, and they have taken an important step in the recovery of Zeluan thru the capture of the town of Nador. (See map of the seat of war published in *THE INDEPENDENT* of August 12.) Mulai Hafid is alarmed at the success of the

campaign which the Spanish troops are conducting in his territory. The Moroccan Foreign Minister, Sid Mohammed Gabbas, has sent a letter of protest to the Powers against the presence of such a large body of foreign troops in Morocco and asked for their intervention. The Spanish minister at Tangier has demanded the withdrawal of this note, and France has announced the intention of disregarding it. It is expected that after subduing the Moors Spain will insist at least upon the cession of Mount Gurugu and some of the territory surrounding Melilla as a guarantee of the security of that post.—The Republicans and Liberals in Spain are highly incensed against the Government because of the refusal to assemble Parliament and to restore the constitutional guarantees. At Castro, near Barcelona, a religious procession was attacked by a mob, and a priest and another man were killed and fifty-six persons wounded.

Aviation The French military balloon "Republique" was wrecked near Moulins and four officers on board were killed. The balloon was at a height of about 500 feet when a blade of the propeller broke off and was driven thru the gas bag, causing it to collapse and fall straight to the ground. Three of the men were found dead when the car and silk envelop were lifted off, and the fourth died in a few minutes. The dirigible "Republique" was built for the French Government a year ago, and was similar in form to the dirigible "Patrie," which was carried away by a storm. The "Republique" had a cigar-shaped balloon with a capacity of 3,700 cubic meters and was equipped with an 80 horse-power motor. It had a carrying capacity of 3,800 pounds. The news was received at the time when President Fallières was opening the Salon of Aviation in the Champs Elysées.—The new aerodrome at Johannesthal, near Berlin, was opened September 26 by an aeroplane contest, in which, however, no good flights were made. A Bleriot monoplane, carrying M. Alfred Lablanc, made too sharp a curve around a corner of a course and turned a complete somersault. The machine was smashed, but the aviator was not injured.

Donald B. McMillan

BY CLIFTON A. TOWLE

[Mr. McMillan was one of the two scientists who accompanied Peary on his expedition to the Pole. He made invaluable studies and brought back much interesting material. The following sketch of him is by a colleague at Worcester Academy.—EDITOR.]

DONALD B. McMILLAN loves the sea and all that concerns it. He enjoys sailing a small boat in a stiff breeze more than any other sport, and if there is a bit of danger in it all the better. He would rather taste the salt spray swept into his face from the crest of some wave which he is plowing thru than sit down to an elaborate feast. This love of the sea was born in him, for his father and grandfather were old Scotch sailing masters. Love of adventure, too, was his inheritance. In boyhood he was the most daring of all

the lads in Provincetown, and this venturesome spirit drove him later, in college, to the top of King's Chapel spire, hand over hand, on the lightning-rod, to remove a flag which had been raised in derision of his class.

It has been Mr. McMillan's fondest hope, ever since he was old enough to read and understand books on polar exploration, that some day he might be a member of an expedition to the North Pole. In his library at Worcester Academy he has all the obtainable books on Arctic work and he knows them well enough, too, to tell the contents of each in much detail. The enthusiasm with which he joined Commander Peary's party in June, 1908, was wonderful to see.

On account of Mr. McMillan's ability as a sailor and navigator and on account of his love of the sea, the position of first officer aboard large schooners has several times been offered him. He possesses medals and diplomas given him as rewards for risking his life in saving drowning persons.

At Worcester Academy Mr. McMillan is the idol of all students. They admire him because he "does things" as boys would like to do them. He takes the lead in the work and play of the boys who come most intimately in contact with him. Enthusiasm, patience, fun, grit, loyalty and reverence are some of the prominent qualities which make Mr. McMillan a friend of all whom he knows, man or boy. It would not be accurate to leave out of an account of his personality the fact that he is a noble example of the highest type of

DONALD B. McMILLAN

simple Christian manhood. The golden rule is his motto, and selfishness was altogether left out of his make-up. Words similar to Commander Peary's praise of him are always spoken by those who know him.

Provincetown, Mass., a city of sailors, is Mr. McMillan's birthplace, and seafaring people were his ancestors. He is thirty-four years old. Capt. Neil McMillan kissed his son Donald one morning something over twenty-five years ago and set sail for the north. Since that time nothing has been heard from his vessel or crew. Donald—or Don, as his playmates called him—had to work to help support the large family which was left behind, but he managed to go to school and to prepare for col-

lege, an uncommon thing for boys of his time in Provincetown to do. Sixteen years after Commander Peary graduated from Bowdoin College Mr. McMillan entered the same institution. The words "trained athlete" are fit for him, for the spirit which characterizes his whole boyhood made him a member of the football and track teams of his college, and he has been an athlete and a teacher of athletics ever since then. Typhoid fever caused him to drop back a year in college, and he graduated in 1898 from Bowdoin. He taught in the high school as principal in Gorham, Me.; then in the Swarthmore Preparatory School, at Swarthmore, Pa., and since then he has been physical director in Worcester Academy, Worcester, Mass.

WORCESTER ACADEMY, WORCESTER, MASS.

Achievements of Negroes

BY BOOKER T. WASHINGTON, LL.D.

PRINCIPAL OF TUSKEGEE INSTITUTE, ALABAMA.

THE fact that a colored man, Matt Henson, accompanied Commander Robert E. Peary practically to the North Pole on his recent expedition has caused a great deal of comment and discussion. This discussion leads me to remark that the people of America, I fear, do not realize to what an extent negroes have taken part in nearly every important event connected with the history and development of this country.

Negroes accompanied the first Spanish explorers and discoverers of America across the Isthmus of Panama with Balboa, and assisted in constructing the first ship that was launched on the Pacific. They were with Cortez in Mexico in 1522.

A negro by the name of Little Stephen was the first discoverer of the country of the Zunis, what is now called New Mexico.

Negroes were with De Soto in 1540, and the first stranger who settled in the State of Alabama was one of the negroes who accompanied De Soto on his march thru that State.

A negro accompanied William Clark, of Lewis and Clark's expedition, which, in 1840, explored the sources of the Missouri River and gained for the United

States the vast and rich extent of land known as the Oregon country.

MATTHEW HENSON

Negroes were among the first adventurers to look for gold in California, and when John C. Frémont, in 1848, made his desperate and disastrous attempt to find a pathway across the Rocky Mountains, he was accompanied by a negro named Saunders.

Negroes have taken part, so far as I can learn, in all the wars that have been fought on American soil. They fought at Bunker Hill, in the Revolutionary War. In the War of 1812 James Fortin, a negro sailmaker of Philadelphia, raised

a regiment of negro soldiers to defend the city from the intended attack of the British soldiers. Negroes were in the famous battle on Lake Erie under Perry. They fought on both sides in the Civil War. In the Spanish-American War negroes not only did their full part at El Caney and San Juan Hill, but after these battles were over, they took up the more difficult and more dangerous labor of working in the hospitals in the malaria-haunted camp at Siboney.

—DASKALOFF.

George Borup

BY CLARENCE R. HALL

[There is more of what we magazine editors call "human interest" in George Borup's account of his experiences farthest North than in any other story yet emanating from those returning from the Pole. Thru the courtesy of the *New York Times* we print in full the young Yale athlete's story which was taken from a letter to his father, Col. H. D. Borup, U. S. A. Possibly the English department at Yale would criticise certain informalities of style, but the locutions are familiar on the campus. It will be remembered that Mr. Borup equalled Nansen's record of farthest North and was the one who holds the record for the fastest day's journey. We precede the narrative by a short sketch of Mr. Borup by another member of the Yale Class of 1907, Clarence R. Hall. —Editor.]

"I was sorry to lose this young Yale runner with his enthusiasm and pluck. He had led his heavy sledge over the floes in a way that commanded every one's admiration, and would have made his father's eyes glisten." —From Peary's story, *New York Times*, September 10.

IT was not as a runner that George Borup made his first appearance at Yale. In fact, when the Sophomore Daskaloff confronted him within the ring of the Seniors' torches at the annual Freshman-Sophomore wrestling match, and the referees gave the word to clinch, running was not to be thought of

GEORGE BORUP

Borup did not run. He lost his match. But his classmates will not soon forget the two plucky bouts in which he held his own with the man in the class above him. Nor will they forget the third desperate struggle, in which he was finally defeated by the Macedonian, five years his senior. The *Yale News* thus briefly describes the contest:

"In the lightweight class, D. Z. Daskaloff was put up by the Sophomores and Borup by the Freshmen. The first two bouts were draws, and the third was won by the Sophomore."

But Borup was a runner. In spite of

an injury to his knee which necessitated an operation in his Sophomore year, he worked on the track persistently thruout the four years of his course, winning his A.Y.A and his class numerals. At the same time he kept up the wrestling and "gym" work, and was a member of the golf team. The highest honors were not his. But he made his mark as a runner and athlete in a large university by his grit and determination.

Borup comes from a family which has had previous Yale connections. His father, Col. H. D. Borup, who has hurried to Sydney to meet his son, was a West Pointer. But his uncle and cousin,

F. Potter, '78, and J. H. Simpson, '98, were both good sons of Eli. Borup prepared for college in the Holbrook School and later at Groton. And those schools may be pleased to know that he won in his Junior year the Dissertation rank, thus finally defeating his old opponent Daskaloff, who was classed among the Second Colloquys, four grades below.

The members of the class of 1907 will not need to open their class books to recall Borup. They can easily picture for themselves his wiry build and quick step, his curly hair, his keen and steady gaze, and his smile, kindly and genial.

NEW HAVEN, CONN.

Winning the Pole

BY GEORGE BORUP

"**D**EAR Dad: Gee whiz! I've had a wonderful trip, and wish in many ways we had been stuck up here for another year. The Commander has been just great to me from start to finish. He is kindness and consideration personified, and we fellows would do anything for him. After we got to Cape Sheridan last fall, as soon as the ice got strong enough to hold, the fall sledging of supplies began. I was out in the field for about a month, sledging about 500 miles, but after one two-week trip came in with two heels, two big toes and ball of one foot frostbitten, which was damnably annoying, as it laid me up a month. Cause, inexperience. Was all right by the December moon, when I sledged some 225 miles in ten days, taking provisions toward Cape Columbia. In the January moon I went with four Eskimos to a large glacier about 100 miles from us, in the interior of the country. We went after deer, but didn't get any. However, hares were so thick you'd fall over them, and one day we struck a herd of a few millions and annexed sixty. Not bad for one rifle and one shotgun, with twenty shells. We cached them in an igloo till the next day, when we would come after them with the dogs and sledges.

"Now, about this time of the year cold

was no name for it, for on the bed platform of my igloo in the mountain one night it was minus 17° F., with two two-burner, 4-inch wick stoves going, and you can guess what it was like outside—nearly minus 50°. Well, the next day we went after them—I mean the hares—with the sledges and dogs, but on the way back, tho we only had six miles to go, a terrific wind with a blinding drift came up, so we could not see ten yards. The Eskimos and I, after fighting for a couple of hours to find our igloo, gave up and sought shelter behind our sledges. They had forgotten our snow knives and could not build an igloo, and for twenty-four hours we were hung up there. I didn't dare do as they did, lie down and let the snow cover me up and go to sleep, for fear I'd freeze, so I had an unpleasant time until the wind died down enough for us to find our way back to our igloo, not half a mile away, which we did some twenty-four hours afterward. The way we then proceeded to pile in the grub would have made you sit up and take notice. We each ate a ten-pound hare, tea, pemmican and biscuit. Luckily we came thru uninjured, tho I froze the ends of four or more fingers. We killed eighty-three hares this trip, average weight nine to ten pounds. In the February moon two Es-

Eskimos and I went hunting to Clement Markham Inlet for an eight-day trip, but saw nothing.

"I left the boat for the northern trip February 19. There was enough twilight to see it travel eight hours a day by, tho the sun did not come back till March 6, the last time I saw it in the fall being October 8. I left Cape Columbia in command of the advanced supporting party on February 28, with the thermometer at minus 50°. At that temperature whisky is frozen stiff, alcohol so cold you can drop a match in it and it will not light, your nose freezes every ten minutes unless you warm it up, and the ends of your fingers by this time are all excoriated from being repeatedly frostbitten, etc.

"I went with the Captain, who, with three men, was the trail picker. Three marches out I dumped off the load of all my party, and we headed for the land according to orders, some 25 miles distant in an air line. The Commander was to leave March 1, and was to give me instructions on meeting the returning party what to bring back. Marvin also was to come back with me. A heavy wind from the east had gotten in the game the second day out, and faulted the trail, blowing the outside ice 'way to the west of the inside ice. The result was I missed Peary on my way to the land. After a good deal of lost time the original trail was finally found, and after doubling back some four miles in an unsuccessful attempt to overhaul him, I lit out for Columbia, because if I went any further after him I'd be unable to make land the same day and so lose valuable time. The march was a "heller," about eighteen hours long, with no time to eat; the sea ice had drifted from 10 to 15 miles west of where I had left the land ice, and the total distance we covered was not far from 40 miles, fully one-half of which I ran.

"The next day a heavy wind prevented our starting, as we couldn't see the trail. This wind was only an evidence about five miles out to sea, so Marvin, who had been sent back as soon as the Commander had found I'd gone by, managed to reach Columbia late that day. The next day, March 5, after being held up by a wind for five hours, we got under

way, but where the sea ice and the land ice meet there was a stretch of open water about 100 yards wide, extending in either direction as far as the eye could reach. Being shy both of airships, boats and submarines, and as it was a bit too cool for swimming, there was nothing to do but wait for it to freeze over or be jammed together. This took place six days later. These six days were the longest and most hellish I ever want to see. It isn't the physical side of the game which is bad; it's the mental strain. We knew how vital it was to get out to Peary with our loads and with a lot of alcohol. The tins of fuel he had with him went to the bad, or threatened to, the second day out, and without hot tea twice a day, with these temperatures, I doubt if man could live. I know I couldn't. Besides, the Eskimos were losing their 'sand,' wanted to put for the boat, said we'd all die out at sea, etc., and we were afraid of a wholesale desertion.

"On the morning of the sixth day the lead closed, and two Eskimos, both afflicted with cold feet, came to land and said Peary had been held up four days by open water four marches out. We got under way at once, and, following their trail, found the original trail made by the Captain and me eleven days before, over which the Commander had gone. A storm and the darkness forced us to halt at the first encampment. Here one of my Eskimos went temporarily 'bughouse,' and, stripped to the waist, began running around outside, looking for trouble. We managed to get his clothes on after a while, and prevented him from getting frostbitten. That day we made a forced march of twelve hours or more, and got to the third encampment.

"The next day we marched about eighteen hours and slept at the fifth encampment. It was very cold, minus 53°, and I froze my left heel, where I had done it last fall. The husky who was bughouse the night before thawed it out on his stomach. At the fourth encampment we got a note from the Commander saying he had left that camp the previous morning, March 11, after waiting six days. It said: 'It is vital that you overtake and give us fuel.'

We were now only one march behind

him. Marvin called for a volunteer to go ahead and tell the Commander we were behind. The best man, named Sigloo, who afterward went to the Pole with Peary, responded, and after four hours' sleep went on. That was going some. After 40 miles or so he went with only five gallons of alcohol, dumping off his loads. The rest of us were dead tired after the march the day before, and so were the dogs. The result was we merely held our own and did not gain on the flying leader. A good rest, and the next day we decided to catch him or 'croak,' and we did without trouble, as he waited. I guess the finish of that Marathon race of four and a half days to catch the main party, which had a head start of more than 40 miles, when the Commander came out to shake me by the hand, was the best day of my life.

"MacMillan, my roommate, went back from here with a badly frozen heel; the doctor, too. I went on five more marches to about $85^{\circ} 23'$, or about 136 knots from the land, when I was sent back in command of the second supporting party. On reaching the shore, in spite of two cripples, I went a hundred miles west to lay down a caché, in the eventuality of the Commander being driven to the west. Then I headed for the ship, fair heel-and-toe walking every bit of the way, covering about 800 miles.

"I stayed on board seven days, when the remnants of the ill-fated third supporting party came in. As a rule, the sledges come in at full speed, but these came in at a funeral gait, and Marvin nowhere to be seen. The first words of his two Eskimos were enough: 'Marvin gone—young ice.' The poor fellow was dead. The shock was pretty fierce, you bet. He was a dandy man, a fine leader, and devilish sandy. They came in Saturday night at midnight.

"Now, MacMillan and Marvin were to have gone to the most northern point of Greenland to lay down a line of supplies in case the Commander hit that coast like he did last time. Well, Marvin being gone, I took his place, and after hurying preparations, MacMillan, as cool, nervy, sandy and strong as they make 'em, and I left the 'Roosevelt' in thirty-six hours and reached Cape Morris Jesup, past Lockwood's furthest of

$83^{\circ} 24'$, with ease. Here we stayed two weeks, 'Mac' going out to $84^{\circ} 15'$ to sound, and I making tidal observations, according to orders. Here we lived high, killing forty-seven musk oxen in four hunts, and dogs and men had sirloin and tenderloin all the time. As none of us had had any fresh meat in three months, it was more than good. I got mixed up in one herd of sixteen, and took some good photos of them. Then we killed them all by gun. I beat all records, Duffy's included, when I got within ten feet of a big bull, held at bay by two dogs, to take his photo, and he charged the dogs, which happened to be on a line between us. I only hit the high spots for a hundred yards or so.

"Coming back we made what I believe is a world's record in sledge traveling. The last two days or so we were all more or less snow blind. Rested up one week, then went off on a hunting trip. Killed four musk oxen, 100 miles away, and brought back a calf on the sledge alive to the boat, only to have it die the next day. When we got down to Eskimo land we put in about four days walrus hunting. In all, about seventy-two were secured. Some very exciting scenes occurred. Once a bull walrus, when we had engaged a herd of fifty, came up alongside of me, got his tusks on the gunwale of the boat so close to me that, to hit him with my rifle, I had to let her go off at port arms, as, if I fired it from my shoulder the muzzle would have been beyond his head. It was exciting, all right, to have his great, ugly face right alongside of me, when it would have been easier to smash him with my fist than gun.

"On another occasion a big bull dived and put a large hole in the bottom, which, owing to its being double, we couldn't repair, and one man had to be kept baling. The walrus came up again and I hit him in the head, wounding him badly but not killing him. He stayed down twenty minutes, and while we were all looking for him, smash! rip! bang! he came up under the stern, nearly knocked the bo's'un overboard, put a hole you could put both fists thru just above the water line, dived, came up just fifteen yards off, gave his fierce battle cry of 'Huk! Huk! Huk!' and charged

us. I got my artillery in action, and sunk him for keeps before he could do any more. When we reached the 'Roosevelt' we were half full of water. He was a scrapper, and don't you forget it.

"The worst jar I ever had was when 'Mac' was shot. The bullet smashed thru two partitions, missed one man's head by two feet, passed two feet over the mate, who was lying on his side on the partition, two feet over my head on the other side, and smashed poor 'Mac' all to hell. I heard the report in my sleep. Poor 'Mac,' saying, 'My God, he has got me,' jumped out of bed, too. I saw him hanging on to one arm while blood was everywhere. Quoth he: 'Gee! this is worse than being wakened by an alarm clock.' Maybe he isn't sandy. He is nearly well now, thank God.

"Your letters, clippings and rifle received from the 'Jeanie' August 23. Many thanks. They were great. Also whaler's mail left by Adams, of the 'Morning Star,' two days later. It was bully of you to think of getting so much up to me, especially Mickleson and Amundsen, also letters from my friends.

"I did most of the photograph work. The big camera was great, especially the finder, which, in taking photos of musk ox, etc., enables you to keep an eye on the brute, so as to be ready to make a quick getaway when he charges. A few yards start gained in this way is very useful in avoiding being caught in close contact with his horns.

"I broke thru young ice several times, but got out all right. It wasn't very cold when I went in.

"Peary has been just great. This expedition from start to finish is a picnic compared to what sufferings most Arctic expeditions go thru. We went in parlor cars, thanks to the Commander, who has worked the Arctic ice problem out and down to a science. Instead of the inactivity of previous expeditions in the winter, we were all out, most of us going 500 to 600 miles. Thirty years ago a man venturing on an extended journey of several hundred miles would have been committing suicide. Nares, the leader of the English expedition of 1875-6, says that men can't face a wind in a temperature of minus 30°, but we did that, and a darn sight lower, in the

wind. He also says, 'Only for life or death must a man go out in the fearful cold of March.' We went out all winter, and the English didn't start from the boat till April 2.

"Just one example of the advantage of dog power instead of man power. Beaumont, a man of indomitable energy, of the English expedition, went to his furthest on the Greenland coast at thirty marches, which 'Mac' and I covered, in spite of two short ones on account of smashed sledges. He and his men were dead at the end, but we were going at a canter.

"Greely, speaking of Lockwood and Brainard's work, says about as follows concerning an attempt to beat their mark furthest north, obtained on the Greenland coast, 'that only perfect ice conditions, indomitable energy of leader and men, would enable their record to be smashed.' They took a whole season to do it. We did it, coming back from the northern expedition with ridiculous ease. Just a picnic from start to finish. This is not blowing my horn, but simply to state a few facts that will speak for themselves.

"These performances were due to the great system Peary has developed, to his breaking us in the best way, so that when we started north in February, Dr. 'Mac' and I, who had never been in the Arctic before, had stacked up against conditions many other expeditions would never dare face, and had sledged enough to make us veterans. Result, confidence in ourselves and equipment, and, what's more, as to the conditions likely to be met with.

"Another point, in a country where the English found no game they died of scurvy. Where Greely, Brainard and Lockwood, fine men as they were, could obtain no game, we, thru the Eskimos, never were in want of fresh meat, and, unlike what you will find in most books, I don't imagine you will find in my diary or in those of the others, which are fairly voluminous, any evidence that I was conducting a clinic or a continual squeal on the cold.

"I can tell you this member of the Class of 1907 has been up against some queer conditions, and I have learned many things since I saw you last. Pos-

sibly the queerest, but not the most uncomfortable, was when my Eskimo and I had run out of fuel after being hung up at Cape Fashaw Martin for four days by heavy winds. We had to beat in the teeth of a howling gale and drifts so bad the dogs could hardly be induced to face them, which nipped and froze our faces for 25 miles, when it was so cold we had to run practically the whole way to keep warm, but I could appreciate the humorous side of it.

"One thing is sure, this Arctic trip shows, as you have often told me when up against it good, and you are here a good deal of the time, there is nothing

like going at everything with a grin and good-naturedly, like the Eskimos; and no matter how scared, as when I had an angry Eskimo, whom I had thrown, point his rifle at me and look as tho he meant business, or when crossing ice which bends beneath you and the thermometer in the minus fifties, so if you break thru, *c'est fine*—no matter how worried or put out, to keep that grin that won't come off there, and don't show a sign of fear, as the Eskimos are none too sandy anyhow, and it's up to you to furnish the ginger, steam and sand to keep them jollied and care free, no matter how you feel.

"GEORGE BORUP."

The New Altrurian Battleship

BY PARK BENJAMIN

THE sixth article of the Constitution of the Republic of Altruria provides as follows:

VI. The Congress shall have power to organize, equip and maintain a navy which shall be composed of:

(a) Police vessels.

(b) War vessels—but no war vessels shall be of the same type or character of construction as the most formidable vessel of the foreign nation possessing the largest existing navy.

This article was the outcome of long discussion thruout all the sessions of the Constitutional Convention. Three parties were formed: The first, insisting upon a navy which should be more powerful than the navy of any other nation, and hence advocating a continuance of the race for more battleships of steadily increasing size, armament and cost; the second, demanding an "adequate navy," but invariably taking refuge in a fog of words whenever called upon to set forth explicitly what the term "adequate" actually meant; and the third, and in the beginning the smallest, group of partisans, contending for the kind of navy which was finally decided upon and which is set forth in the foregoing quotation.

The contention of this last named faction was that no small proportion of the immense cost of existing navies was due

to the failure of the world to recognize that the police functions and the war functions of a public armed vessel were wholly dissimilar, and that it was as much an anachronism to combine them both in every ship as it would be to make every soldier a constable and every constable a soldier. They pointed out that, despite the total disappearance of piracy, warships still retained many features designed far more for the destruction of the weakly armed sea rover than for that of each other; that as a matter of fact, up to within the last dozen years, not only was every navy overloaded with ships which, however well suited to pirate elimination, could not possibly be factors in deciding wars, but that every navy systematically distributed its units in numerous little squadrons at widely separated points, again, a course well calculated to clear the ocean of marine scamps, but ridiculous from the point of view of naval strategy. With piracy out of the way, the police functions of a public ship, they asserted, comprised merely the enforcement of international law governing the relations of merchant vessels, of the national laws against smuggling, fishing in certain waters, and seal killing, and the "showing of the flag" in ports where the powers that be were likely to

be influenced in the direction of justice to American interests or American citizens by the simple presence of a national ship, especially while diplomatic or consular "representations" were in progress. While they conceded that such vessels might, in war time, be utilized as scouts, supply ships or as auxiliaries generally, they adhered firmly to their argument that the true war vessel properly possessed no police function at all, but was simply one which, in conjunction with others of the same type, or, in some cases, even alone, could act decisively toward bringing about or hastening the end of the "plague." They used that name, because it was another tenet of theirs that modern wars do not have their prototypes in the man-quelling struggles of antiquity, but in the devastating diseases which used to destroy whole communities at a sweep. That sort of destruction, they said, was simply the outcome of a particular kind of ignorance, now dispelled, and if the present variety of ignorance which results in wars could likewise be overcome, wars and plagues would be equally obsolete.

Furthermore, they pointed out, and with much force, that battles on the ocean were not decided any longer by laying ships yard arm to yard arm, so that boarders might rush from the one upon the deck of the other and there settle the issue by hand to hand struggle and "cold steel"—("No captain can do wrong who lays his ship alongside of an enemy"—Neison)—but by extremely accurate weapons mounted in designedly impregnable floating citadels, operated by highly skilled artillerists, often at long distances apart; and that, as any nation could hire, if not produce, such experts, and any nation could build or buy in the market of any other nation citadels and weapons of the existing orthodox pattern (so long as it made the purchase before the state of war began), the whole present situation reduced itself to a mere matter of available cash—and the longest purse in the family of nations would win. Therefore, the logical outcome was that, if the healthiest national existence is that which is fortified by the biggest navy, then the Republic of Altruria ought to have the biggest navy, and ought accordingly to devote

its entire revenue to that end—which is obviously a *reductio ad absurdum*, since nothing would then be available to provide Congressional excursions during the summer, or build post-offices in uninhabited districts, or pay thugs for slapping the pockets of returning Altrurian travelers, let alone such minor needs as popular education and the general conduct of the Government.

The framers of the Constitution—commonly termed the Fathers—at last hit on the novel idea which became enacted in paragraph b. The Altrurians are an astonishingly inventive people, and while the republic was quite young, made the only two advances in naval warfare accomplished since the days of Greece and Rome. The Bullonians, it will be remembered, attacked them with snub-nosed wooden tubs impelled by sails and armed with small cannon, which could not carry more than a few hundred yards, and which were normally laid level. The Bullonian idea, which had worked well against the Crapaudians and the Dagoes, was to induce the enemy to get within range of their pop-guns, shoot high and cut his rigging to bring down his sails, and then, when he could not get away, close in and eviscerate him with cutlasses. To this thoughtful procedure the Altrurians opposed clipper-built vessels that could sail all around the snub-nosed tubs—sharp, long, "fir-built" things, with tremendous clouds of sails—and which could easily keep out of the range of the little Bullonian cannon; and they armed them, moreover, with long, thin guns which shot very quick and very hard, and provided people to point those guns who were used to bringing down ducks on the wing with a single bullet, and taught them how to convert the snub-nosed tubs into sieves by treating their hulls as targets to be fired at and poked full of holes below the water line. That gave the Bullonians a great deal of trouble and incidentally ended the career of all the snub-nosed tubs.

Fifty years later the Bullonians, and indeed about everybody except the Altrurians, said that nothing more dangerous could possibly ever, or at any time, be constructed than huge iron stoves filled everywhere with wood, and driven

some by sails helped along by steam engines, and others by steam engines helped along by sails. The Altrurians regarded these claims indifferently, but in the course of a family dispute casually provided a floating, self-moving iron bandbox, with an especially big cannon in it, which was turned in any direction by concealed machinery, while the bandbox made such a miserably small target nobody could hit it. The Bullonians pooh-poohed the whole plan, but adopted it; fastened sails to the bandbox, put two bandboxes on one of their stoves and upset the stove and drowned everybody in it, got rid of the sails, and in due time, having gone steadily backward from the bandbox, they evolved a lot of peripatetic marine museums which they called Dreadnaughts. And so, at the time of the adoption of the Altrurian Constitution, it had come to pass that everybody was trying to make more and bigger and more expensive Dreadnaughts than everybody else, and meanwhile starving the school-teachers.

So the promoters of Article 6 asked the country upon which it would stake its faith—the length of its purse or the people's ingenuity, meaning by the latter the ability to send the Bullonian ships into the scrap heap, not by ferociously poking holes in them, but by amiably concocting new kinds of ships which, whenever the Bullonians got too self-confident—as they had twice before become over their snub-nosed tubs and their floating stoves—would put them out of conceit with their whole navy and lead them once more to the conclusion that it had better be built all over again.

Hence the constitutional provision, and hence the astonishing recent performance of the new Altrurian warship, which has escaped the notice of all the newspapers—except now *THE INDEPENDENT*. As is well known, there has been such a scare in Bullonia, over the possibility of some other navy challenging her title to be mistress of her only food route, that not long ago practically the whole Bullonian fleet was packed into one roadstead in order to stiffen the backbones of the Bullonian populace. At least, that was assigned as the cause, but it is now known not to have been the

real one, for, in a word, the true reason was the advent of the new Altrurian battleship.

While the Bullonian fleet was gathering off Bicklow Swirl, this remarkable craft appeared. It did nothing offensive. It merely moved among the Bullonian vessels in an aimless sort of way, sometimes shooting off at astonishing speed, sometimes showing up in the middle of the night, sometimes loafing along beside the Bullonian column, occasionally behind it, occasionally rising above and then disappearing below the horizon, but never doing anything in the least bit rude or discourteous, even when tested by the strict rules of naval etiquette.

Now that Altrurian vessel looked a good deal like a "whale back," such as one sees on the Great Lakes, only she was longer and narrower, say 500 feet in length and perhaps not over 30 or 40 feet in beam. Her deck, which curved over on each side, rose at the highest barely 3 feet above the water and was armored. Nothing showed on it except a low conning tower and a periscope tube, which, as is now common in torpedo boats and submarines, projected the picture of her surroundings upon the whitened table in front of the helmsman far below the water line. Her frames were of light but excessively strong steel, some one of the odd alloys which have lately been invented, and they were filled in with immensely strong but again light compressed paper pulp. Oil carried in her double bottom supplied the fuel for her tremendously powerful internal combustion engines, which drove a multiplicity of propellers, and gave her a speed of at least 35 knots per hour. Her sole armament was ten fish torpedoes on each side, each delivered from a separate water-tight compartment, each capable of going straight for 4,000 yards under water, and at a speed of perhaps 37 knots, and in the racks adjacent to each torpedo tube were six spare torpedoes. The absence of guns and of all armor except the protective deck, together with the light construction of the hull, rendered it possible to give to the gas engines the high power noted, not only for a sudden dash, but for comparatively long periods of time, and while

the vessel was driving ahead, a peculiar formation of her bow sent the sea over her for a depth probably sufficient to cause any projectile striking her at the necessarily low angle to glance and ricochet from her deck without penetration.

The Altrurians found that they could build six vessels like that for the cost of one Dreadnaught, and that she needed for her management less than one-fifth of a Dreadnaught crew. So they constructed a single specimen and sent her to the Bullonian shores while the big fleet was gathering, as already described.

And some things about her rather troubled the Bullonian admirals. They perceived that it would be of no use to fire at such a vessel, because she made practically no target when rushing into action "bows on." Indeed, it is hard to hit any target for which the muzzles of the guns must be depressed. Besides, she had a way of suddenly appearing out of the low-lying fog which always comes when the water and air are of certain different temperatures, and this before anybody suspected her whereabouts. And because of her speed she could lie far off from the fleet and arrive close at hand at any desired moment, say in thick or foggy weather, or when the fleet was threading narrow straits, or otherwise navigating troublesome waters. Ordinary scouts or torpedo boats could not catch her, and in any event, her vicinity would be as dangerous to them as to anybody.

What demoralized the Bullonian admirals was the calm way in which she dogged their columns at sea. If the fleet was cruising in Indian file (column), the Altrurian, somewhere astern and ordinarily invisible, would unexpectedly run up alongside the last ship in the line—of course, merely to exchange compliments with her captain; but any one could see that if torpedoes had taken the place of the honeyed phrases, that would have been the last of the Bullonian rear guard. And it would obviously not be difficult for the Altrurian, if he so desired, to bite off, so to speak, in this way, ship by ship, and thus gradually destroy the whole fleet, for of what use would it be for the advance ships to double back? The Altrurian would merely change position and continue to attack the rear-

most, however the line might vary. Nor would steaming in double column help matters, for then the unwelcome visitor could run in between the two rear ships, which could not fire at him without hitting one another, while he could simply radiate torpedoes into both of them at once.

"Why, he needn't stand off at torpedo range and fire at us, sir," said the junior Bullonian admiral to the commander-in-chief—the fleet being then at sea engaged in practising battle tactics and about 50 miles from home. "I don't know why he shouldn't run right alongside and drive in his torpedoes at his leisure."

"And get sunk himself by ours?" replied the superior.

"Not necessarily, divided as he is into such a multiplicity of compartments. Besides, what if he is sunk? Would it not be good policy to expend for a Dreadnaught a craft costing one-sixth as much?"

"Well, how do you propose to keep him off?"

"Candidly, I don't know, sir. We thought of mines towed astern, in the hope that he might run on one of them."

"But he need not stay exactly astern!"

"Yes, and towing mines does not help one's speed."

"Supposing six of those craft attacked us at the same time?"

The two admirals gazed on one another thoughtfully.

"Where is the infernal thing now?" finally remarked the senior.

"I don't know, sir."

"Does anybody know?"

"No, sir."

"Do you see any use of keeping up these maneuvers out here any longer?"

"No, sir."

"As soon as you get back to your flagship I'm going to signal the fleet to make the best of its way to Bicklow Swirl and come to anchor."

"Very good, sir."

Any family desiring to purchase second-hand Dreadnaughts can be accommodated at liberal terms. The Bullonians and the Crapaudians and the Dagoes and the savage tribes which once annihilated the legions of Varus have no further use for theirs, and do not intend

to build any more. And the Altrurians, having strictly complied with Article 6 of their Constitution, and knowing that it will take many, many years for their "kin across the sea" to catch up with their latest naval revolution, are devoting all their energies to dry farming.

The present writer does not insist that the Altrurian battleship roughly indicated in the foregoing is the only correct deduction from the present environment, or even that it is the most expedient one. That would be presumption on his part. But he does contend that the existing Dreadnought battleship type is not a true product of evolution, or, in other words, that if a correct deduction be made, the result will be something as far different from the Dreadnaught as the "Monitor" was from the "Minotaur," "Lord Warden," "Magenta," "Solferino," or any of the most formidable "ironclads" which were believed to mark the *ne plus ultra* of naval progress in

1862. And it is his conviction, failing the advent of an international agreement to stop it, that the present frightfully expensive and wasteful race and rivalry in the production of more and constantly bigger warships by the nations can be quickest terminated by the invention or production of a wholly new ship which will render existing types obsolete, especially if the new ship can be built at far less relative cost. And it is his abiding faith that this can be done by the inventors of this country if properly invited and encouraged—and will infallibly be done by them very quickly after the beginning of any maritime war in which this country may unhappily become involved.

For all the foregoing reasons the question is submitted whether the Government should by such encouragement seek a solution of the problem or keep on in the race in order to await a future war, with all the disturbance and losses incident to its outbreak.

NEW YORK CITY.

The Violet Peaks

BY MARY J. ELMENDORF

I SAID to my heart in the years ago:
 "The violet peaks
 Are wondrous fair in the morning glow
 And fair in the twilight gray;
 We will leap to the saddle, you and I,
 And gallantly ride away—
 We will ride away to the west where they lie."

Thru heather and holt by the long white road,
 My heart and I,
 We went, each bearing his work-a-day load
 'Neath skies or frosty or warm;
 And we sang and laughed in the face of the
 wind,
 We laughed at the sun and the storm,
 And we laughed at the leagues we flung
 behind.

We watched the amethyst fires that blaze
 On the violet peaks
 When the light is long; we watched the haze
 That falls in tremulous bars
 With the falling of dusk like the peace of
 prayer;
 And we watched the happy stars,
 The songster stars a-nesting there.

I said to my heart—I was weary that day:
 "The goal is so far,
 O, let us turn back to the olden way—
 To home and comfort and sleep!"
 But never my heart drew rein; cried he,
 And his silver spurs struck deep:
 "The violet peaks are the home for me!"

Now many a year has ripened our quest
 And still we go,
 My heart and I, on our way to the west;
 Yet we laugh as of old and we sing,
 For nearer—ah! nearer—the days and the
 weeks,

The years and the wanderings bring
 Those summits of glory—the violet peaks.

SPOKANE, WASH.

The Tariff Act

BY FRANCIS E. WARREN

UNITED STATES SENATOR FROM WYOMING.

THE Tariff Act of August 5, 1909, in its framing had as careful thought and as earnest labor by the national legislature as any of the general tariff acts which preceded it. Every branch of human industry in our country was given the opportunity to be heard during the prolonged hearings of the Ways and Means Committee of the House, charged with the duty of framing the original draft of this act to provide revenue. Following established custom in tariff legislation, general testimony was not invited by the Senate Committee on Finance when the House act was before it, but no interest seeking a hearing before that committee was denied it, either thru its own representatives or thru Senators or Representatives.

In the Senate ample opportunity was given, and taken advantage of by members, to debate the provisions of the measure; and as differences of opinion regarding it were less partisan than is usual when legislation of such moment is being enacted, it may be asserted that the law as finally passed represents in general the economic views of the country on the question of tariff.

The law enacted is in every sense a revision of the preceding law. The Sixty-first Congress was not elected on an issue in which a universal scaling of the Dingley tariff rates was involved, and no obligation rested on the Congress to reduce all rates. It was obliged, however, to revise and readjust rates to conform to changing business conditions—this obligation involving retention of some rates without change, raising a few in instances where raises were demanded by business conditions, and reducing very many rates, some but slightly, others substantially.

These obligations in the main were fulfilled, and the resultant tariff act, in my belief, will prove of benefit to practically every industry of the country.

The new tariff law removes inconsis-

tencies in Dingley Act rates, and equalizes conditions of production and distribution between this and competing countries.

There was one notable exception, in the removal of the duty upon importations of hides and the placing of hides on the free list. This was not done by the free affirmative action of Congress. I regret that it was done, for it undermines and endangers one of the fundamental principles upon which an equitable protective tariff should be framed, *i. e.*, that there should be proportionate protective duties upon the manufactured product and the raw material forming the base of such product. As the leather schedule now stands, the boot and shoe and harness manufacturers receive adequate protection; the ranchmen and farmers producing the hides do not receive any. It is an unjust discrimination in favor of one class of our citizens and against and at the expense of another class. Besides, it is a foolish relinquishment of one source of revenue, and the two or three million dollars the United States might collect annually will go to Argentina and other countries without benefit to any one in this country. As proof of this, the ink of the President's signature to the law was scarcely dry when newspapers and market reports noted a 10 per cent. advance in the price of Argentine and other foreign hides, and a month later there was another advance of more than 5 per cent., so that the removal of the old duty of 15 per cent. collected by the United States inures to the benefit of the foreign hide producers. Hides now cost the tanners just as much as formerly, when 15 per cent. was added to the foreign price.

Regardless of this one indefensible feature of the new law, I believe it will prove a just and equitable measure, and that it will serve to maintain prosperity for many years to come.

CHEYENNE, WYO.

Next Steps After the Tariff

BY W. B. HEYBURN

UNITED STATES SENATOR FROM IDAHO.

THE INDEPENDENT asks me to express my views relative to the ideas of the "progressive Senators" on the tariff question, with especial reference as to what ought to be done in the immediate future. I am set a difficult task. During the consideration of the tariff bill Senators whom THE INDEPENDENT classes as "progressives" expressed such a great variety of opinions, and suggested such numerous and divergent views relative to questions under and not under consideration that it would be impossible to consider them together, or as a group. The general trend of what was called the "progressives" during the tariff discussion seemed to be in favor of retributive legislation.

I do not desire to indulge in any personal criticism of Senators. Such suggestions as I make will be directed only against the propositions advanced by them. It seemed to me that more than one of them thought that the occasion of the tariff legislation was opportune for the adoption of new schemes of government and innovations in our laws which were entirely beyond and outside of the appropriate scope of the tariff bill. For instance, the general income tax bill, while having for its purpose the raising of revenue, was clearly beyond the scope of the legislation under consideration because that no such legislation could be made effective for raising revenue except at the end of long litigation.

The provision for submitting to the vote of the States a Constitutional Amendment authorizing Congress to enact a general income tax law was apart from and outside of tariff legislation, but I think it was proper to give Congress the unquestioned power, leaving the wisdom of the exercise of the power to future consideration.

The most inconsistent and dangerous "progressives" in and out of Congress were those who favored the admission free of duty of what they called raw material. They denominated a part of the

people consumers, and another part producers, losing sight of the fact that the producers of one commodity are the consumers of another. They did not object to compelling the farmers and stock raisers of the country to compete with the foreign farmers and stock raisers in the product of hides and skins, in one sense the raw material of more general production in the United States than any other. They did not care that the American producer of this commodity should be compelled to sell to them in our own market in competition with the producer of the same class of commodity in foreign countries, but they insisted that no foreign producer of a commodity in which they dealt should have access to the American market to compete with them in that market for the trade of the American people. These men called themselves "progressives." They remind me of the old man whose morning prayer was:

"God bless me and my wife,
My son John and his wife,
Us four and no more, etc. Amen"

The unction with which they would talk about protection to American industries as applied to their own interests and denounce the industry of every other man as being corrupted by graft, trusts, combinations and other evils was most diverting. They conjured up a leather trust that was used as a monster of frightful mien threatening to devour the people should the same character of protection be afforded to the producer of kine and skins as was given to the manufacturer of the products thereof. Manifest justice demanded that a uniform rule be applied to all the interests affecting the people of any and all parts of the United States by such a discriminating import duty in their favor as would secure the American market to the American producer, and allow the foreign producer to enter it only by paying such an entrance fee as should always give the American producer the best of it as against the foreign

producer. This sentiment is the Alpha and Omega of the tariff question. It is the foundation of our Government. The foreign people are not our guests but our rivals in business. There is no courtesy due them that would justify them in claiming equal rights with our own people in our markets. Every part and every interest of our country is entitled to exactly the same consideration at the hands of their Representatives in Congress. The prosperity and perpetuity of the country depend upon this principle being observed. Government is a principle and not a scramble for preference. Politics is the science of government and not the science of obtaining office. A man who talks of the "policy" of the Administration, or the policy of any man holding office under the Government, as a controlling influence, mistakes the character of our Government. It is not one resting upon the "policy" of any man or of any combination of men less than the majority of the people. Personal "Policies" belong to kings and monarchs. The only "policy" to be considered by us is that of the people, and the "policy" of the Administration of the Government must be based upon law that has been enacted and not upon laws that it would like to see enacted.

The term "progressive Republicans," as applied to those so designated, is misapplied. They propose changes in the Government that are not in the line of progression; they propose changes of principle. The principles of our Government have not changed since the beginning and it will be a sad day for the country when they are changed.

The Republican party did not promise in the Chicago platform, or elsewhere, or ever at all, to change, modify or revise its principles. It did promise to revise the tariff laws but it did not specify or imply the manner of revision, and it is the merest sophistry to say that there was an implied promise to revise the tariff downward. To admit such a claim

would be to admit that the Republican party had a secret purpose at the time of the Chicago convention for substituting some other method of raising revenue to meet the expenses of the Government than by the tariff system of the party. An individual or corporation income tax is proposed, the result of which would be to necessitate the cutting down of duties on imports at the custom houses to the extent of the amount of the income tax to avoid a useless surplus.

It is clearly to the advantage of all the people of the country and their business interests that the agitation of questions affecting tariff legislation should cease at once. The mistakes that Congress may have made in the recently enacted law will be infinitely less harmful than the further agitation of the question. All recognize the importance of the element of stability in business and must also recognize the fact that with a continued threat of change, whether it affect the business interests, or the monetary system of the country, there can be no stability under which the people will feel that confidence needed to maintain prosperous business relations at home and abroad.

New conditions arising from time to time will necessitate new or further legislation but never a change in the fundamental principles of our Government.

The words "progressive," "reformers" and such other favorite designations as the minority within political parties are fond of assuming, require close scrutiny to distinguish in them the selfish motives that in most cases actuate those who assume such titles. In nearly every instance they are accompanied by an effort to secure office or political preference, or distinction. A real reform that improves the condition of the people emanates from the conservative judgment of those who do not feel that it is necessary to tear down existing conditions that represent the wisdom of the past in order to find room for necessary change.

WALLACE, LEAH

The Exile of My Private Secretary, Mr. Gusev

BY LEO TOLSTOY

YESTERDAY at ten o'clock at night several men in uniform rode up to my house and asked for Nikolay Nikolayevich Gusev, the man who helped me in my work.

Nikolay Nikolayevich went downstairs to the men who had inquired for him, and after a conversation with them returned and told us that the men were the captain of police and the district commissary, who had come to take him to the Krapivna prison, from where he was to be sent into exile in Cherdyn in the government of Perm.

This was strange news. I asked the men to explain the cause of such queer action. In answer the captain of police pulled out a small piece of paper from his pocket, and with great solemnity read the decree of the Minister of the Interior, in which the Minister said, that for the sake of the welfare of the Russian people entrusted to his care and in accordance with article 384 and perhaps some other articles (I do not understand why they had to refer to any article or articles to do what they were doing), Nikolay Nikolayevich Gusev must be put under surveillance and exiled for spreading revolutionary literature. For some reasons known to the Minister of the Interior Gusev must be sent to Cherdyn, in the government of Perm, and to no other place, and for the same reasons he must stay there for exactly two years.

After hearing the decree I considered further conversation with them useless, and walked into my room to take leave of Nikolay Nikolayevich Gusev, and settle matters with him in regard to my work. I found my household and guests greatly excited over the absolutely unexpected incident. Gusev is much respected and loved by all of us. The only calm and cheerful one was Gusev the guilty. With his usual kindness and concern for others he quickly put my affairs in order. He had been allowed only half an hour in which to prepare for his going.

We have all heard of thousands and thousands of such cases. But when the event happens before our very eyes to those near us, it affects us peculiarly. That is why Gusev's case seemed so startling to me. Strange that Gusev should be treated so absurdly, strange the cruel measures taken against him, and strange the plain injustice of the reasons set forth for his arrest. The absurdest thing of all was the incongruity between the measures employed and the object those measures were supposed to attain, in reference both to Gusev and myself, the person against whom those measures were really directed.

Absurd enough to seize a man unexpectedly at night and march him off and throw him in prison (everybody knows what a Russian prison means nowadays when they are so overcrowded), and lead him under armed guard for over 2,000 versts to a solitary spot 400 versts from the city. But especially absurd and incongruous is such conduct toward a man like Gusev.

One should have seen how my people and guests, who knew Gusev, took leave of him. All, young and old, children and servants, felt the same love and respect for him, and a more or less restrained indignation against those who were responsible for his arrest.

On taking leave of Gusev I burst into tears, not out of pity for him—I could not pity him, since I knew he lived that spiritual life which prevents external accidents from depriving a man of his genuine happiness—but because I was stirred to see the firmness amounting to cheerfulness with which he accepted the misfortune.

And this man, kind, gentle, true, an enemy of all violence, desiring to serve everybody without asking anything in return—this man they seized at night, locked up in a prison infected with typhus, and exiled to a place which is known to those who do the exiling only

by the fact that they consider it an extremely unpleasant place to live in.

Still stranger was the cause for which Gusev was seized, imprisoned and exiled. The authorities said Gusev spread revolutionary literature. In all the two years during which he lived with me he not only did not spread revolutionary books, but did not so much as possess or read them. In fact, he was entirely opposed to such literature. The books which in fulfilment of my commissions he sent by mail or handed personally to certain persons were not revolutionary books. They were my own books.

Now, my books may seem bad and unpleasant, but by no means can they be called revolutionary, since they very definitely and decisively oppose every form of revolutionary activity. For this reason all the revolutionary organs condemn and ridicule them. Therefore, the charge that Gusev had anything to do with the spread of revolutionary literature is absolutely untrue, without the least basis in fact.

As to the foolishness of exiling Gusev, why, it is really foolish to speak of it. If Gusev is a harmful person, will he be less harmful in Cherdyn, where there is nobody to watch over his actions than in the very center of Russia, where his activity is exposed to the general view?

On the contrary, it would seem that persons torn from their own sphere, deprived of their means of making a livelihood, angered by their exile, thrown together with other exiles smarting under the same treatment—it would seem that such persons would be much more harmful than if they remained where they were. But this idea never occurs to anybody. The authorities are used to exiling, and so that's what they do. But whether it is good or bad, useful or harmful, both for those to whom it is done and for society in general—no one thinks about that. People hold positions, get paid for their positions, and do what it is customary to do. But as to what the consequence of their activity is, and whether it is just or not—that, nobody, from the highest to the lowest, gives himself the trouble to think about.

"It's the custom, and we act accordingly. If we make mistakes occasionally, what's to be done? We have so much

to attend to. We are very sorry if we make mistakes, but we can't help it."

A mother is killed by grief, a wife is kept in prison for a whole year, men are made insane, executed, their characters corrupted, their souls destroyed—"what can we do?" they say, "we've made a mistake." Just as if they had accidentally stepped on your toe and were to say, "Excuse me, it was unintentional."

This thoughtlessness is the most terrible thing of all.

So much in regard to the cruelty and futility of the treatment of Gusev. But the futility of such conduct in regard to myself is still more amazing. The whole thing is this: Among the noxious elements to be crushed out of existence is Tolstoy with his fool's preaching about nonsensical non-resistance and a certain Christianity, which he himself invented. All this prattle, of course, has no significance and is not to be taken seriously. Nevertheless, it is embarrassing, because it says, "Thou shalt not kill," and because by some peculiar arguments it tries to prove that ownership in land is not legitimate, and so on. Therefore it must be stopped at all hazards. "The simplest means would be to sentence Tolstoy himself. We could easily do so in the name of the same articles that we do everything. We could put him in prison for about five years. He would die there, and stop bothering us. That, of course, would be the very best. But outside of Russia they don't know—as we do here—how empty his teachings are. So they attach more importance to him. Therefore, to send him to prison in Krapivna like Gusev might, after all, prove a little awkward. The only thing we can do, which we'll exert all our efforts to do without let or hindrance, is to injure all his friends and make it unpleasant for them. Tho we cannot stop him with one effective blow on the head, we can force him into silence by continually harassing him."

Such is the argument those must have used who banished Chertkov and who are now going to exile Gusev, since the object of banishing Chertkov could not have been to transfer the harm he was doing from the government of Tula to the government of Moscow, and the object of exiling Gusev could not have

been to transfer the harm from Kravivna to Cherdyn. The only object could have been to diminish or altogether destroy the harm done by Tolstoy.

It is this incongruity between the means employed and the end sought after which is so strange. The means are incongruous, in the first place, because, no matter how people may regard my thoughts, I consider them true and needful, and, above all, I consider my chief aim in life to be this: To express them, and, therefore, as I have already said elsewhere, as long as I live, I will continue to express them, and the taking away of Chertkov and Gusev from me can in no way change my activity. Just as thru Gusev I have given and sent my books to those who desired them, so I will keep on giving and sending them with the help of other people, dozens of whom have offered me their services. Or, if all these persons should be exiled to Cherdyn or some other place I will give and send them myself to anybody who asks for them. I cannot refuse to present my books to those who wish them, just as in personal conversation I cannot refuse to answer when I am asked about what I know.

The measures the government authorities use against me are absurd for a further reason: It is possible to get rid of bombs and bomb throwers by taking the bombs away from them and imprisoning or killing them; but it is impossible to do the same with ideas. Violence against ideas and their carriers not only does not weaken, but invariably strengthens their effect.

Therefore, and this is the chief object of my present writing, I appeal to these people once again—if it is absolutely impossible for them to keep calm, if they must needs use violence, I ask them to use it, not against my friends, but

against me, who am the only one responsible both for the creation and the spread of the unwelcome ideas.

I have said all this in reference to Gusev and myself. But something else moved me to make this statement, which is still more important. I allude to the spiritual condition of those who execute such orders as the order against Gusev.

We all know what terrible things have been going on in Russia for the last few years and still continue to go on. It is so terrible that one does not like to speak about it. What a pity for all those who have perished and still perish, all those embittered persons in exile and in prison, all those dying with malice and hatred upon the gallows! Yet it is impossible not to pity also those unfortunates who execute the order and, above all, those who prescribe them.

For no matter how much they may assure themselves that they are doing this for the common weal, no matter how much others like themselves may approve and praise them for their deeds, no matter how they may strive to drug themselves with all sorts of preoccupations and amusements, they are human beings, nevertheless, and for the most part, good people, and they feel and know in the depths of their souls that they are acting badly, that by doing what they do they kill that which is dearer than anything else in the world, their souls, that they shut the door against themselves to all the true and best joys in life.

And so I would like to use the present occasion, which is of little consequence to Gusev or myself, to speak to these people. Bethink yourselves. Think of your lives, think how you waste the spiritual powers God has given you. Look into your souls. Have pity on yourselves.

YASNAYA POLIANA, RUSSIA.

“Bob-for-Short”

BY LOUISE DUNHAM GOLDSBERRY

WE had delayed the naming. It seemed an unnecessary superfluity, when he was clad as in shining raiment, with all love's loveliest names. And being the one single and only, both baby, and grandbaby, and great grandbaby, he was "THE BABY." In letters and conversations regarding his adorable self, "THE BABY" was all sufficing.

He answered to love-names in most blithe fashion.

If it was the old great-grandfather piped at door, "Is there any 'old man' here wants to ride my cane?" you'd hear answer piping back, "I'm tumin', I'm *des* a-tumin'," and that frolicsome steed would be ridden and tamed and fed and talked to. And if the grandfather would say, "I wish this family possessed a real, sure-enough baby," there'd cling to his leg a fat little body, and a blithe voice would coax up, "Here's you baby, Dran-dad; did you *foun'* some tanny in you potet?"

So, "Heart's-ease," to me alone; he could not know how dear an ease, but no one else was ever permitted to call him that. That was the name belonged to the twilight time, when he and I went to sea in the big rocker and love-made by the firelight and sung and told secrets. Then, oh! the sweets of the wet, sweet lips, the hearts-ease of the clinging arms, the sweet child-body close crushed to the breasts he has just outgrown.

The old deaf neighbor who passes twice a day always nods down, "Hello, Sissy." And the wrathful wee voice always shrills up, "*Ain't* Sissy." And "Nicodemus," his yellow dog, sits on his tail and laughs all over his face, to hear a boy called "Sissy." As if anybody could fail to know that ONLY boys shoot pretend-guns and drill behind police-men when the station-house-policemen drill, and ONLY boys have yellow dogs, beautiful and beloved.

Grandmother comforts: "Never mind. Little Boy; neighbor's so deaf, that's why he does not know you are a boy. If

we'd *just* cut off his curls, daughter?" And I answer, one more time, "He's *all* the baby I've got." And put it off for another day; he'll be a day bigger tomorrow.

But Grandma understands; my beautiful, wise, fair-hearted mother, with her exquisite larkspur eyes that read life so tenderly for every one, and the broken heart of her that bears burden for all her world.

And, coward that I am, I cannot bear to push him one inch on the way out of babyhood. It is so divinely dear to be to him the every beat of his heart, the song that babbles from his lips, the all of life—to him!

Then, too, who would love me and take me to hunt the first flowers of the year in the woods behind the cemetery, and fill my days with the wee sweet singings of him and the laughter of him, and the nights with the love-lamp eyes of him starring all my dreams?

To be sure, always, when we get to the end of the rainbow for that pot o' honey and pot o' gold, we're just too late. But its many the one we've dug for where the rainbow-feet *had* touched. Ah, yes, just always too late; but we hear, always, the leaf-laughters and whisperings in the woods, where the trees are talking, and tho we are suspecting it is of us they are talking and laughing, we do not mind, and we both know we shall come a-chasing the very next rainbow that walks those woods.

And who would there be to play with me, if I make haste to grow-up my baby?

Great-grandfather smuggled in a boy's suit one day. Quite a gorgeous affair in brass buttons and brass braid. I wondered where in the world he found such a circus-y small-boy-suit.

"Could I just borrow an old man?" said the snagged old voice, just as soft and snagged as a baby child's when the milk-teeth are falling.

The little white body, all naked and beautiful from the evening tub, wrig-

gled from my hands and sped toward the voice. Vanished. And from the sounds that trailed over great-grandfather's transom we knew mischief was making. Then he came in. Holding up his trails with his two hands, blouse tied midway, fat stomach and chin, a derby a-top his corn-silk floss—and starry eyes and crimson cheeks.

"Its trowses," said he, in vainglorious voice. You could fairly *see* the cock in that voice. "*An' a blowser an' a hat,*" said he, in shrill arrogance.

Such a blissful swagger in the words: "*Now folks will know I'm a boy!*"

"Oh, 'Dreat-dran-dad,'" I gasped, "if your *mother* only knew you'd been to the circus.

He sniggered.

I pointed to The Baby, strutting more and more slowly as his "trowses" trailed longer and his blouse descended and engulfed his knees.

"Did you *think* he was twins?"

But he gave no answer save a joyous chuckle.

Step for step "Nicodemus" paraded with his little master.

"Ain't it mos' time to *det* up for bekfus?" said my baby.

I knew. He was simply bursting to get out to the front sidewalk and crow over neighbor. Just splitting with man-pride to be recognized as a man and brother.

"Well," I mused, "maybe, Grandfather, you'd better take this crib down to the trunk room, and I'll show the gentleman to the guest room."

I lifted one end of the little, low crib. It stood just where I could reach hand over and my baby could hold to it and love-make back to sleep, when he wakened for the "dink o' water" nightly.

"Ah, no, sir, no, sir, Dreat-dran," as the fat wee feet padded swiftly past. "It's my's trib. It's me's. *An' I'm des a-doin to do to bed.*"

And he was in my lap, lips finding mine. "We's *des* a-tendin'." he explained, "an' I love you *so*, dear."

"This boy must have a name," said his Grandfather. "Our men have always been named John or James Bunyan or Gregory. There was a Judge John and a Governor Duncan and a Judge James

B. Take your choice. My own name, while rather long, would fit him."

Great-grandfather snorted. "'Twould just match the trousers. My brass-eyed trousers and your name; Duncan John H.—and not a soul knows what the H. stands for."

Grandfather stiffened. "The H., sir, is Hannah. My mother had declared her first should be a girl named Hannah; my father had decided his firstborn should bear his name of Duncan John. So."

"*'Ain't* sissy,'" quoted Great-grandfather.

"I have no desire that the child should be named 'Hannah,'" said Grandfather, with dignity.

"Why?" said Great-grandfather, turning suddenly upon me. "*Why?*"

I hesitated. Should I tell or should I not. How dear the words had been on my husband's lips. Always, when we knelt to pray, he clasped me in his arm, and praying aloud, prayed my heart with his own. Always, that tenderer, stiller tone; always the same words: "*And bless the baby that is coming to us.*" Those beautiful long months when we traveled God's unknown with our child, each night's star-rising bringing him a day's journey nearer us.

And when he was dying those dear last words had whispered above my head as his hand gathered the wee, witless feet in love's last caress. "*God . . . bless . . . the . . . baby!*"

No, I could not tell.

That was why, I think, I always called him the Baby. And the adoring family, too; but only they did not know the why. And I had a queer feeling that I wanted the child to name himself.

We called him in. He is always, nearly always, quickly obedient. He is passing on to "Nicodemus," all our axioms of manners and life, and as "Nicodemus" is not always quickly obedient, he is trying the effect upon him of example.

"Nicodemus" at heels, he came. Grandfather's crossed legs allured. He stopped to take a riotous brief trip on his foot. Great-grandfather's cane leaned against a chair he had to pass, and on that frolicsome wild-steed he had an exciting runaway.

"Do you want your curls cut off," said grandmother, making eyes at him behind her spectacles.

"Fot bid *eyes* you've dot," he shouted; "fot bid E-Y-E-S you've dot, drannuvver."

"Do you want trowsers, young man?" said great-grandfather.

He smiled up at great-grandfather in a beguiling way.

"Did you eat *all* your teef up wif tanny, dreat-gran? All your teef *up*?"

It took some time to reach my lap; and I could not make "Duncan John H." fit the bobbing curls, tho I knew the stately father of my boy's father was fitting it there, in all the interrupted progress to my lap.

Grandfather leaned over. I knew that cherished name was under the hand that so fondly touched the head at last leaned hard against me.

"Boy, you must have a name. Jim and Jamie, and Sterling, all the little fellows have names. What do you want to be called?"

Thus, grandfather.

Leg crossed, chin in hand, he meditated. The eyes, released from "Nicodemus's" last antic, studied the ceiling; lower, the lids began to fall, then adoring, sweet, the look clung to mine. The kissing look of them, where did he get it? And the hand patting my cheek, how my heart purred and sung under it.

"I fink," said he, very slow, very decided, "I fink I'll name my's self *like* mye muvver. My's muvver is dot a mos' bu-ti-ful name."

"*Sissy - name.*" said great grandfather.

He started, and hugged me very tight in lover arms.

"Is a *mos'* bu-ti-ful name," said he; "but if we was two, maybe we'd get all mixed an' 'Nitodemus' wouldn't unnerstan'."

"Listen, my baby. Once upon a time

a brave man went to a war, and there was a bad battle. He was a very young man, and he had hair the color of yours, too, and eyes the color of yours, and he found an old man, badly wounded, oh, very badly wounded, and he begged the boy to take him to his own soldiers; and the boy—I don't know how—but somehow, the wounded boy got the badly wounded old man across the fields to his own soldiers, and died. You see, if he had used his strength to save himself, he would have lived. But he gave his life to the old soldier; and after the war that old soldier took the boy out of his grave and brought him North to his mother."

"*Fy* is drannuvver trying?"

But grandmother's wet eyes were shining as she lifted him to her heart and kissed his eyes, that were the color of the dead boy's eyes, and kissed his corn-silk curls, that were the color of the dead boy's curls.

"Because the dead boy was grandmother's boy," she said, "and grandmother is very proud."

"Fot was his *name*?"

"Robert; but we call him Bob for short," said grandmother, softly, thinking in present tenses.

"Is it a bu-ti-ful name? 'Mos' as bu-ti-ful as muvver's name *is*?"

"'Most as beautiful as mother's," said grandmother.

"All yite," said he; "*all* yite."

Next Sunday we took him to church to be christened into the name he had chosen. Great-grandfather and grandfather and grandmother and I, we all went with him. One to go was not enough. Four, almost too many. But was he not our only one? THE BABY?

"What name do you give this child," said the minister.

And before I could reply the answer was made.

"It's Wobert," he piped; "but we *tall* him Bob for short."

WASHINGTON, D. C.

The Novels of Björnson

BY WILLIAM LYON PHELPS, Ph.D.

LAMPSON PROFESSOR OF ENGLISH LITERATURE AT YALE UNIVERSITY

FOR over half a century this intellectual athlete has been one of the busiest men in the world. A partisan fighter born and bred, he has been active in every political Scandinavian struggle; in religious questions he has fought first on one side and then on the other, changing only by honest conviction, and hitting with all his might every time; to him the word Education is as a red rag to a bull, for he believes that it has been mainly bad, and if people will only listen, he can make it mainly good; in a passion of chivalry, he has drawn his pen for the cause of Woman, whose "sphere" he hopes to change—the most modern and the most popular of all the vain attempts to square the circle; his powerful voice has been heard on the lecture platform not only in his own beloved country, but all over Europe and in America; he has served for years as Theater-Director, in the determination to convert the playhouse, like everything else he touches, into a vast moral force. In addition to all the excitement of a life spent in fighting, his purely literary activity has been enormous in quantity and astonishing in range. His numerous dramas treat of all possible themes, from the old Sagas to modern divorce laws; and after exhausting all earthly material, he has boldly advanced into the realm of the supernatural; his splendid play, "Beyond Human Power," holds the boards in most European cities, and has exercised a profound influence on modern drama. His novels are as different in style and purpose as it is possible for the novels of one man to be; and some of them are already classics. A man with such an endowment, with such tremendous convictions, with buoyant optimism and terrific energy, has made no small stir in the world, and it will be a long time before the name of Björnsterne Björnson is forgotten.

Had he not possessed, in addition to a fine mind, a magnificent physical frame, he would long since have vanished into

that spiritual world that has interested him so deeply. But he has the physique of a Norse god. Many instances of his bodily strength and endurance have been cited; it is sufficient to remember that even after his mane of hair had become entirely gray he regularly took his bath by standing naked under a mountain waterfall. Let that suffice, as one trial of it would for most of us. He came honestly by his health and vigor, born as he was on a lonely mountain-side in Norway. It was in the winter of 1832 that this sturdy baby gave his first cry for freedom, his father being a village pastor, whose flock were literally scattered among steep and desolate rocks, where the salient feature of the landscape during nine months of the year was snow. More than once the good shepherd had to seek and save that which was lost. For society, the little boy had a few pet animals and the dreams engendered by supreme loneliness. But when he was six years old the father was fortunately called to a pastorate in a beautiful valley on the west coast, surrounded by noble and inspiring scenery, the effect of which is visibly seen in all his early stories. We cannot help comparing this vale of beauty, trailing clouds of glory over Björnson's boyhood, with the flat, wet, dismal gloom of East Prussia, that opprest so heavily the child Sudermann, and made Dame Care look so gray.

At the grammar school, at the high school and at the university he showed little interest in the curriculum, and no particular aptitude for study; but before leaving college he had already begun original composition, and at the age of twenty-four he published a masterpiece. This was the pastoral romance, "Synnöve Solbakken," which for sheer beauty of style and atmosphere he has never surpassed. For some years preceding the date of its appearance there had been a lull in literary activity in Norway. Out of this premonitory hush of stillness

came a beautiful voice, which by the newness and freshness of its tones aroused immediate interest. Everybody listened, enchanted by the strange harmony. Men saw that a new prophet had arisen in Israel. The absolute simplicity of the style, the naïveté of the story, the naturalness of the characters, the short, passionate sentences like those of the Sagas, the lyrically poetic atmosphere, appealed at once to the Norwegian heart. Why is it that we are surprised in books and in plays by simple language and natural characters? It must be that we are so accustomed to literary conventions remote from actual life that when we behold real people and hear natural talk in works of art our first emotion is glad astonishment. For the same reason we praise certain persons for displaying what we call common sense. Be this as it may, no one believed that a pastoral romance could be so vigorous, so fresh and so true. Of all forms of literature, pastoral tales, whether in verse or in prose, have been commonly the most artificial and the most insipid; but here was the breath of life. I can recommend nothing better for the soul weary of the closeness of modern naturalism than a course of reading in the early work of Björnson.

He followed this initial success with three other beautiful prose lyrics—"Arne" (1859), "A Happy Boy" (1860), and "The Fisher Maiden" (1868). These stories exhibit the same qualities so strikingly displayed in "Synnövé Solbakken." In all this artistic production Björnson is an impressionist, reproducing with absolute fidelity what he saw, both in the world of matter and of spirit. We may rely faithfully on the correctness of these pictures, whether they portray natural scenery, country customs or peasant character. We inhale Norway. We can smell the pines. The nipping and eager air, the dark green resinous forests—we feel these as plainly as if we were physically present in the Land of the Midnight Sun. The kindly simplicity of the peasants, the village ceremonies at weddings and funerals, the cheerful loneliness with sheep on mountain pasture, and the subdued but universal note of deep rural piety, make one feel as tho the whole community were

bound by gold chains about the feet of God. Björnson says, "The church is in the foreground of Norwegian peasant life." And indeed everything seems to center around God's acre, and the spire of the meeting-house points in the same direction as the stories themselves. Many beautiful passages affect us like noble music; our eyes are filled with happy tears.

In view of the strong and ardent personality of the author, it is curious that these early romances should be so truly objective. One feels his personality in a general way, as one feels that of Turgenev; but the young writer separates himself entirely from the course of the story; he nowhere interferes. The characters apparently develop without his assistance, as the events take place without any manipulation. This is all entirely different from the standard English novel, as represented by Dickens, Thackeray and De Morgan. As a work of objective art, "Synnövé Solbakken" approaches flawless perfection. It has one plot, which travels in one direction—forward. The persons are intensely Norwegian, but there their similarity ends. Each is individualized. The simplicity of the story is so remarkable that to some superficial and unobservant readers it has seemed childish. The very acme of art is so close to Nature that it sometimes is mistaken for no art at all, like the acting of Garrick or the style of Jane Austen. Adverse criticisms are the highest compliments. Language is well managed when it expresses profound thoughts in words clear to a child.

The love scenes in this narrative are idyllic; in fact, the whole book is an idyl. It seems radiant with sunshine. It is as pure as a mountain lake, and as refreshing. And besides the artistic unity of the work, that satisfies one's standards so fully, there is an exquisite something hard to define; a play of fancy, a veil of poetic beauty lingering over the story, that makes us feel when we have closed the book as if we were gazing at a clear winter sunset.

Björnson has the creative imagination of the true poet. In the wonderful prologue to "Arne" he gives the trees separate personalities in a manner to arouse the envy of Thomas Hardy. Indeed, the

author of "The Woodlanders" has never felt the trees more intensely than the Norwegian novelist. The prose style unconsciously breaks into verse form at times, with the natural grace and ease of a singing bird. Not the least charming incidents in Björnson's romances are the frequent lyrics, that spring up like cowslips in a pasture.

"Punctual as Springtide forth peep they."

The novels in Björnson's second period are so totally unlike those we have just been considering that if all his work had been published anonymously, no one would have ventured to say that the same man had written "A Happy Boy" and "In God's Way." There came a pause in his creative activity. He wrote little imaginative literature, and many thought the well of his inspiration had gone dry. Really he was passing thru a belated *sturm und drang*; a tremendous intellectual struggle and fermentation had set in, from which he emerged mentally a changed man, with a new outfit of opinions and ideas. At nearly the same time his great contemporary Tolstoy was also in the Slough of Despond, but he climbed out on the other side and set his face toward the Celestial City. Björnson's floundering ultimately carried him in precisely the opposite direction. While Tolstoy was studying the New Testament, Björnson applied himself to Darwin, Mill and Spencer, and became completely converted from the Christianity of his youth. Many minds would have been temporarily paralyzed by such a result, and would finally have become either pessimistic or coldly critical. But Björnson simply could not endure to be a gloomy, cynical spectator of life, like his countryman, Ibsen, any more than he could leave his native land and calmly view its nakedness from the comfortable environment of Munich or Rome. Björnson has the sort of intellect that cannot remain in equilibrium. He was ever a fighter, and cannot live without something to fight for. The natural optimism of his temperament, so opposed in every way to the blank despair of Ibsen, made him see in his new views the way of salvation. He is just as sure he is right now as he was when he held opinions exactly the contrary. With joyful ardor

he became the champion and propagandist of democracy in politics and of free thought in religion; apparently adopting Spencer's saying, "To the true reformer no institution is sacred, no belief above criticism." For the word reformer precisely describes Björnson; like the chief characters in his later novels, he is an apostle of reform, zealous, tireless and tiresome.

Lowell, in his fine essay on Gray, said that one reason why the eighteenth century was so comfortable was that "responsibility for the universe had not then been invented." Now, Björnson feels this responsibility with all the strength of his nature, and however admirable it may be as a moral quality, it has vitiated his artistic career. As he renounced Christianity for agnosticism, so he renounced romance for realism. The novels written since 1875 are not only unlike his early pastoral romances in literary style; they are totally different productions in tone, in spirit and in intention. And, from the point of view of art, they are, in my opinion, as inferior to the work of his youth as Hawthorne's campaign "Life of Pierce" is inferior to "The Scarlet Letter." In every way Björnson is farther off from heaven than when he was a boy.

In addition to many short sketches, his later period includes three realistic novels. These are: "Flags Are Flying in Town and Harbor" (1884), translated into English with the title, "The Heritage of the Kurts," for it is a study in heredity; "In God's Way" (1889),¹ loudly proclaimed as his masterpiece, and "Mary" (1906). The first two originally attracted more attention abroad than at home. "The 'Flags'" hung idly in Norway, and the orthodox were not anxious to get in God's way. But the second book produced considerable excitement in England, which finally reacted in Christiania and Copenhagen; it is still hotly discussed. In these three novels the author has stepped out of the rôle of artist and become a kind of professor of pedagogy, his specialty being the education of women. In "Flags" the principal part of the story is taken up with a girls' school, which gives the novelist an opportunity to include a confused

¹In the original the title is "In God's Ways."

study of heredity, and to air all sorts of educational theory. The chief one appears to be that in the curriculum for young girls the "major" should be physiology. Hygiene, which so many bewildered persons are accepting just now in lieu of the Gospel, plays a heavy part in Björnson's later work. The gymnasium in "Flags" takes the place of the church in "Synnövé"; and acrobatic feats of the body are deemed more healthful than the religious aspirations of the soul. Kallem, a prominent character of the story, "In God's Way," usually appears walking on his hands, which is not the only fashion in which he is upside down. The book "Flags" is, frankly speaking, an intolerable bore. The hero, Rendalen, who also appears in the subsequent novel, is the mouthpiece of the new opinions of the author; a convenient if clumsy device, for whenever Björnson wishes to expound his views on education, hygiene or religion, he simply makes Rendalen deliver a lecture. Didactic novels are in general a poor substitute either for learning or for fiction, but they are doubly bad when the author is confused in his ideas of science and in his notions of art. One general "lesson" emerges from the jargon of this book—that men should suffer for immorality as severely as women, a doctrine neither new nor practicable. The difficulty is that with Björnson, as with some others who shout this edict, the equalizing of the punishment takes the form of leaving the men as they are, and issuing a general pardon to the women. Rendalen, the head-master of the school, is constantly bringing up this topic, and he makes it the chief subject for discussion in the girls' debating society! These females are going to be emancipated. A pseudo-scientific twist is also given to this novel by the introduction of mesmerism and hypnotic influence, matters in which the author is deeply interested. We are given to understand that a large number of women are annually ruined, not by their lack of moral conviction and will power, but simply by the hypnotic influence of men. One may perhaps reasonably doubt the ultimate value of a wide dissemination of this great idea, especially in a young ladies' seminary. To the unsympathetic reader, the one

question that will keep him afloat in all this welter, is not concerned with pedagogy; it is the honest attempt to discover why the book bears its strange title. Unfortunately he will not find out until the last leaf. Then

the commission of suicide with the poet are seen."

It is pleasant to take up the volume "In God's Way," for, however disappointing it may be to those who know the young Björnson, it is vastly superior to "Flags." It is what is called today a "strong" novel, and has naturally evoked the widest variation of comment. By many it has been greeted with enthusiastic admiration and by many with outspoken disgust. Psychologically, it is indeed powerful. The characters are interesting, and they develop in a way that may or may not be God's, but resemble His in being mysterious. One cannot foresee in the early chapters what is going to happen to the *dramatis personæ*, nor what is to be our final attitude toward any of them. Think of the impression made on us by our first acquaintance with Josephine, or Kallem, or Ragni, or Ole; and then compare it with the state of our feelings as we draw near the end. Not one of these characters remains the same; each one develops, and develops as they might in actual life. Björnson does not approach his men and women from an easy chair, in the descriptive manner; once created, we feel that they would grow without his aid.

For all this particular triumph of art, "In God's Way" is plainly a didactic novel, with the author preaching from beginning to end. The "fighting" quality in the novelist gets the better of his literary genius. We have a story in the extreme realistic style, marked by occasional scenes of great beauty and force; but the exposition of doctrine is somewhat vague and confused, and the construction of the whole work decidedly inartistic. Two general points, however, are made clear: First, that one may walk in God's way without believing in God. Religion is of no importance in comparison with conduct, nor have the two things any vital or necessary connection. This is a modern view, and perhaps a natural reaction from the strictness of Björnson's childhood training. Second,

that virtue is a matter entirely of the heart, bearing no relation whatever to the statute-book. A woman may be legally an adulteress and yet absolutely pure. This also is quite familiar to us in the pages of modern dramatists and novelists. Björnson has taken an extraordinary instance to prove his thesis, a thesis that perhaps needs no emphasis, for human nature is only too well disposed to make its moral creed coincide with its bodily instincts.

The same theme—mental as opposed to physical female chastity—is the leading idea of "Mary," a novel that has had considerable success in Norway and in Germany, but has not yet been translated either into French or English.* This work of his old age shows not the slightest trace of decay. It is an interesting and powerful analysis of a girl's heart, written in short, vigorous sentences. Mary, after taking plenty of time for reflection, and without any solicitation, deliberately gives herself to her lover, in a manner copied exactly from a scene in Maupassant's novel, "Notre Cœur." Her fiancé is naturally amazed, as there has been nothing leading up to this; she comes to him of her own free will. Her theory of conduct (which exemplifies that of Björnson) is that a woman is the sovereign mistress of her own body, and can do what she pleases. There is nothing immoral in a woman's free gift of herself to her lover, provided she does it out of her royal bounty, and not as a weak yielding to masculine pursuit. The next day Mary is grievously disappointed to discover that, instead of the homage and worship she expected, the erstwhile timid lover glories in the sense of possession. She fears that she cannot live an absolutely independent life with such a husband—and Björnson's gospel is, of course, the untrammelled freedom of woman. So, altho she is about to become a mother, she deliberately cancels the engagement to the putative child's father; this puzzles him even more than her previous conduct, tho he is forced to acquiesce. Then, in a final access of despair, as she is about to commit suicide, she is rescued by a man whose love is

like the moth's for the star—who tells her that no matter what she has done, she is the noblest, purest woman on earth, and the chaste queen of his heart. Thus, by a stroke of good fortune, rather than by anything inevitable in the story, the book ends happily, with Mary and her second adoring lover in the very delirium of joy. It is evident that the novel is nothing but a "Tendenz-Roman"; Björnson wishes us to approve of his heroine's conduct thruout—of the entirely unnecessary sacrifice of her virtue, of the subsequent sacrifice of her reputation, and of her remorseless joy in the arms of another man. Such is to be the doctrine of sex equality; men are not to be made more virtuous, but the freedom of women is not only to be pardoned, but approved.

In comparing the three late with the four early novels, the most striking change is instantly apparent to any one who reads "Synnöve Solbakken" and then opens "In God's Way." It is the sudden and depressing change of air, from the mountains to the sickroom. The abundance of medical detail in the later novel is almost nauseating, and would be wholly so were it not absurd. One has only to compare the invigorating scenery and the simple love scenes in "Synnöve" with the minute examination of Ragni's spittle (for tuberculosis) in the other book—but enough is said. Despite all that has been written in praise of Björnson's "courage" in dealing with problems of sex and disease, I sympathize with the cry of his friend in 1879:

"Come back again, dear Björnson, come back!"

It is easy to see that the influence of modern English skepticism cannot account entirely for the revolution in the Norwegian's mind and art. We can clearly observe an attraction much rearer, that has drawn this luminous star so far out of its course. It is none other than the mighty Ibsen. Ibsen's analysis of disease, his examination of marriage problems, his Ishmaelite attacks on the present structure of civilized society—all this has had its effect on his contemporary and countryman. As a destructive force Ibsen is stronger than Björnson, because he is ruthless. But one has the courage of despair, while the other has the courage of hope.

*A translation of "Mary" appears this week as Vol. XIII in the Edmund Gosse edition of Björnson's novels, published by the Macmillan Company.—[Ed.]

Björnson does not believe in Fate and is not afraid of it. He loves and believes in humanity. His gloomiest books end with a vision. There is always a rift in the clouds. Thruout all his career he has set his face steadfastly toward what he has taken to be the true light. Such men compel admiration, no matter whose colors they bear. And however much we may deplore his present course, we cannot now echo the cry of his friend and say, "Come back!" The

language of the poet expresses our attitude:

"Life's night begins: let him never come back to us!

There would be doubt, hesitation and pain,
Forced praise on our part—the glimmer of twilight,

Never glad confident morning again!

Best fight on well, for we taught him strike gallantly,

Menace our heart ere we master his own;

Then let him receive the new knowledge and wait us,

Pardoned in heaven, the first by the throne!"

SEVEN GABLES, HURON CITY, MICH.

The Silly Treun*

BY SEUMAS MAC MANUS

*In Irish-speaking districts the corn-crake is called the *Treun*, which signifies *strength*. He is so called, because, when he called he lies on his back and in awe-stricken admiration contemplating his raised feet cries (in Gaelic) "Strength with Strength! What wonderful strength for the two little feet of one poor bird to hold up all the skies!"

WHEN the gray dust of dayli'gone† was sifting on the lea,
Last evening, I wandered out, my wearied self to flee:
And down a pleasant meadow-field my footsteps carried me.

What place the grass grew long and thick a Treun I did espy
On broad of back prostrated, and his spindle-shanks on high,
A-shouting on the world to see him holding up the sky.

I paused, astounded at this fellow of the creaky tones,
And very big conceit, but nathless very puny bones,
Whom good-for-nothings chased from ditch to ditch with cobble-stones.

"With legs so long, and head so small," I said, "thou knavish bird
That overrun'st our peaceful fields, thou vile unbidden Kurd,
What gave thy brainless thimble-head idea so absurd?

Thou rank impostor," added I, "whose kind our meadows throng,
Sore vexing restful summer eves with this insensate song—
Discordant and impertinent as it is vilely wrong.

O, silly, silly amadan‡ of the conceited cries!
Rascal the most impudent that either walks or flies!
Dost truly think those foolish feet are holding up the skies?

All that vasty space from west to east with all its stars,
Where Cynthia grand and Phœbus fair alternate roll their cars,
And lurid comets trail their portents dread of bloody wars!

Avaunt!" I said, "thy vanity alone the skies might stay!"—
I startled him; he frightened flew into the twilight gray:
And lo! the skies moved not one bit when his heels were drawn away!

I shouted, "Ha, poor fool, art now dissuaded of thy lies?"
And from the distance, floating clear, came back his creaking cries.
"Oh, wonderful, one poor bird's feet to hold up all the skies!"

† "Dayli'gone" (daylight gone) is twilight.
‡ "Amadan" is half wit.

Hudson-Fulton Books

THE publishers are contributing their share to the celebration of New York's tercentenary. A few weeks ago Mrs. Schuyler van Rensselaer's "History of the City of New York" was reviewed in these columns, and now there comes, most timely and welcome, a volume to be set by its side on the bookshelf, and to be read and consulted in connection with it. *Narratives of New Netherland*¹ is the eighth volume of the valuable series of "Original Narratives of Early American History," whose publication in handsome uniform volumes was begun seven years ago under the auspices of the American Historical Association. This latest edition to the reprints is edited by their general editor, Mr. J. Franklin Jameson, and contains, if not all, certainly the most important of the contemporary representations of New Netherland, from Van Meteren's and Juet's accounts of Hudson's voyage to Peter Stuyvesant's report of the surrender of the province, fifty-six years later. De Laet, Wassenauer, De Vries, Father Jogues, Megapolensis, Domine Selyns—all the early authorities are here, the editor deserving special thanks for printing in full the "Privileges and Exemptions for Patroons, Masters and Private Individuals who will Settle any Colonies and Cattle in New Netherland" (1630), and the historic "Representation" of 1650. Special mention should be made here also of a "Description of the Towne of Mannadens as it was in September, 1661," an English document in the possession of the Royal Society of London, of unknown origin, and hitherto unpublished. The author's note on its possible authorship suggests a hidden page of

early New York history. The document is, in itself, of less importance, however, than the "Narrative of a Journey into the Mohawk and Oneida Country, 1634-35," brought to light in 1895, but the editor is not quite accurate in his statement that Gen. James Grant Wilson found it in Amsterdam in that year. As a matter of fact, it was brought to this country by a descendant of the Van Welys, who, like the Van Rensselaers, were pearl merchants in seventeenth-century Amsterdam, and purchased by General Wilson, who at once recognized its value and importance, and published a translation of it in *THE INDEPENDENT*, October 3, 1895. There are three contemporary maps, and a *fac simile* of the title page of the "Privileges and Exemptions." Apart from its service in placing within easy reach of the student sources of early American history which would otherwise have grown increasingly difficult of access, the series continues to be a growing storehouse of true romance, as our historical novelists of a decade ago well knew.

Miss Esther Singleton attempts, in *Dutch New York*,² to draw a picture of the daily life of the worthy burghers, their wives and children, their orchards and gardens, their houses, furniture, silver, glass, curios and ornaments, their housekeeping, servants and slaves, their provisions for the education of their children, their business, recreations, sports and festivals, their courtship and marriage customs, their physicians and surgeons, tavern and excise laws, their religion, superstitions, and many other things. The picture is largely based upon the assumption that the life of the Dutch in New Netherland differed but little in its daily routine and resources from that of the old, which probably was so, if not at first, at least later on; and its less admirable features are not blinked. The illustrations are in part of furniture, porcelain, silver, etc., in pri-

¹NARRATIVES OF NEW NETHERLAND, 1609-1664. Edited by J. Franklin Jameson, Ph.D., LL.D. "Original Narratives of Early American History." Charles Scribner's Sons. 8vo. \$3 net.

vate and public collections in this country, and in part of objects in the National Museum at Amsterdam.

The Picturesque Hudson,³ from its sources in the Adirondacks to the Battery, is described in a little volume by Mr. Clifton Johnson, whose reputation as a descriptive traveler needs no bush. The picturesqueness insisted upon in the title receives its due share of attention, but the author is mostly in the historic mood, oftener revolutionary than colonial, of course; and on his very first page he reminds us of Verrazano, in whose honor our Italian fellow citizens are going to erect a statue, Hudson being scrupulously designated as "the man to whom the river owes its name." The lore of Washington Irving furnishes many a page, from Communipaw to Sleepy Hollow, even as memories of the war for independence accompany the traveler from Harlem Heights to Saratoga. Mr. Johnson traces the name of Hoboken to an Indian village "in the far past" called Hobock; is this derivation quite to be relied upon? There are some pleasant, restful pages devoted to the Hudson's fish and fishermen. An informing, useful little volume, whose perusal will greatly enhance one's enjoyment of the Hudson trip.

Alice Crary Sutcliffe, too, takes us up the Hudson, from New York to Albany, but it is only at the end of her biography of *Robert Fulton*,⁴ which contains all the available material, some of it hitherto unpublished, to make complete the story of the "Clermont's" conception, building and historic first trip. A great-granddaughter of the inventor, the author would impress upon the world what she considers to be his other claims to fame—his experiments with submarines and torpedoes, his advocacy of canals, etc. "An artist with unbounded delight in the glories of color and form," she calls him, and "an American statesman." Sufficient unto this celebration in his honor is the cause thereof. The interest of the book lies in its new material, which includes Fulton's preliminary plans for his steamboat. There are also

some reproductions of portraits and miniatures painted by him in the early days of his career.

"The Hungry Heart"

It is a bad thing for everybody when an honest man without a clear moral sense seizes upon an important truth and develops it according to his point of view with a logic that clutches like ten-penny nails. This is what Mr. David Graham Phillips has accomplished in his latest novel.* He has dramatized, with a veracity that cannot be denied, one of the chief causes of the growing marital unrest of our times. And if he had not worked at his solution with what may be almost praised as a courageous disregard for decency and virtue, the book might be called a moral masterpiece in fiction. As it is, patient, thinking people whose logic is not so destructive as Mr. Phillips's will call it an immoral masterpiece.

Here are three important propositions the story undertakes to demonstrate: First, that marriage is degrading to women where it does not mean equal comradeship in all the relations of the two people married, including the man's business career and the woman's domestic and maternal duties; that the way wives have accepted their husbands, for better and for worse, helping to propagate the race legitimately, and living with all kinds of husbands until death released them, is degrading to women and bad for society. Second, that a woman denied this comradeship with her husband is benefited morally and broadened in the right wisdom of living by committing adultery. Third, that the merely chaste woman is often the most primitive, selfish, hypocritical, contemptible type of a woman, marrying shrewdly, not for love but for a support, less noble and less trustworthy than the other woman with the "hungry heart," who goes about seeking a comrade, as naively indifferent to mere chastity as any lower animal.

Richard and Courtney Vaughn are two young married people. Richard is a chemist engaged in an effort to dis-

³ *The Picturesque Hudson*, by Clifton Johnson. New York: The Century Co., 1907. Pp. 128. Price, 75 cents.

⁴ *Robert Fulton*, by Alice Crary Sutcliffe. New York: The Century Co., 1907. Pp. 320. Price, 1.00.

* *The Hungry Heart*, by David Graham Phillips. New York: D. Appleton & Co., 1907.

cover the secret of heat and a process by which a cheap fuel may be manufactured. He regards his young wife with tenderness, and the author has gone so far toward analyzing this tenderness as to destroy it and give it another name. He gives the reader the impression of interpreting Richard's affection for his wife, *not* as Richard meant it, but as he, Mr. Phillips, understood it—stripped to the polyp nakedness of human passion. Also he is absorbed in his chemistry as other married men are in their various man-businesses, and takes his wife as he would a cigar at the end of the day, just for pleasure. Most of the time he neglects her as most men neglect their wives. Nothing can surpass the power and veracity with which Mr. Phillips has portrayed this very real cause of marital unhappiness in an age when women are not content to be mere creatures of comfort and pleasure, no matter how tenderly cared for, because they are beginning to think ably, like men, and to have the same desire for achievement. Unfortunately, Courtney does not find enough to occupy her in the care of a large house and grounds, but she desires to share her husband's work at the laboratory, not so much because she has the same ambition as her husband, altho she is fond of chemistry, but because she desires to share life with him, and demands not only a home and support, but comradeship with him. He thinks this the foolish whim of a dear, innocent, babyish, inferior creature, and finally shows his teeth man-fashion when she forces the issue and he refuses to grant her wish.

Here follow some years of excellent martyrdom on the part of Courtney which will be recognized and appreciated by many women. Incidentally she becomes fully inspired by the author's views and begins to *think* what women in her position often feel, but rarely have the cleared mental faculty to interpret. We see that she is no longer Courtney, but Mr. David Graham Phillips, in the daintiest of muslins, with her lovely hair piled sweetly above his masculine brows and his eyes that point like bayonets at everybody's dear self-deceit. This metamorphosis is very broadening to her intellectually, but not good for her mor-

ally. Some righteousness eludes logic and mere intelligence, but it is the kind that Eve and Courtney lost when Satan and Mr. Phillips got into their respective gardens. Courtney says she is "glad I've had the sense to eat the apple," and forthwith accepts as her lover the man her husband has taken into partnership in the chemistry business.

Then comes the remorse of their mutual sin. Gallatin, the lover, begins to refer, in an incipient courtship with a "pure" woman, to Courtney as the "bad" woman into whose toils he has fallen, and Courtney finally casts him off because she discovers the same objection to his love that she had to the love of her husband, from whom she has been divorced, namely, that it is not comradeship love between two mated people, but merely male passion for a beautiful woman. Meanwhile Gallatin attracts the pure girl by sniveling about his fallen condition. She agrees to marry him in order to reform him, and more particularly to secure a handsome income and good social position for herself. Incidentally she discards a very worthy young man to whom she had become secretly engaged.

The point that Mr. Phillips makes is that in spite of her chastity this woman is neither good nor trustworthy, and the point is well taken. Men have demanded chastity of women more than they have truthfulness, and their punishment is that they have got what they demanded. But when Mr. Phillips represents Courtney as a greater and better woman because of the experiences she had with her lover, horror fills the reader's mind, and we see that, in the author's effort to destroy some foolish illusions about love, he has fallen into the grossest and most degrading of all delusions, that chastity should count for less than it does in the moral life of women, altho the rest of his contention is certainly justified, that truthfulness should count for more than it does and that women should have a better chance than they now have to tell the truth without fear.

The point where Mr. Phillips's argument breaks down completely is in the demand that women should necessarily share the whole life of their husbands. This would involve professionalizing

marriage by the capabilities of women, just as it has been commercialized by their incapacities. The physician would have to have a physician for a wife. The woman engaged to a lawyer would have to study law. The rogue's wife would have to become his accomplice. And the millionaire's spouse would find congeniality in establishing a co-operative trust; to say nothing of the other part of such a comradeship, where the husband would have to share the wife's domestic duties, like bathing the baby and canning tomatoes for family soup.

The truth of the business is that while an author with Mr. Phillips's remarkable intellectual integrity may discover and dramatize with frightful logic some of the evils that make unfortunate conditions for men and women in the marital relation, he cannot solve such difficulties by offering license in exchange for the restraints and tyrannies and indifference of husbands. What we need in marriage is more old-fashioned, narrow-minded righteousness, more children, cakes and flower beds for the women, and more non-sexual friendliness for the men from their wives. As a matter of fact, mere intellectual honesty that is indifferent to chastity is a rotten kind of honesty that ought to be suppressed.

§

The Development of the English Law of Conspiracy. By James Wallace Bryan. Johns Hopkins University Studies in History and Political Science. Baltimore: The Johns Hopkins Press. 75 cents.

Mr. Bryan has made a very careful and painstaking study of the gradual development in common and statute law of the English law of conspiracy. He claims that he has considered every relevant statute and case from the earliest to the latest which a careful search through ancient and modern law writings has enabled him to bring to light. He evidently believes that the law of conspiracy is righteous in principle and in general beneficent in working, and his prepossession in its favor is clearly shown in the last chapter, in which he deals with combinations of labor. It is somewhat curious that he omits all reference to any cases in the law courts between the Act of 1825 and 1847. The historic case of *Rex v. Loveless et al.*, in which six Dorsetshire laborers were sentenced

to seven years' transportation for forming a union and taking oaths, is not mentioned. It is true that the crime of which these men were accused was the administration of oaths by an illegal society, but it was the trade combination for the raising of wages and not the oaths against which the sentence was directed; and the case was of great importance for the impulse it gave to the movement in favor of the concession of the full right of working men to combine. Mr. Bryan makes a useful contrast of English and American law on the subject of labor combinations. In America labor unions have been dealt with largely under common law, and they have consequently been much more affected by the law of criminal conspiracy than have English trade unions. In England from the beginning of the nineteenth century the subject has been taken in hand by Parliament, and labor legislation has been directed against specific acts, while the combinations have been made legal. That Mr. Bryan fears that the English Parliament has gone too far in its favor to trade unions is easily to be perceived in his closing paragraph. It is greatly to be regretted that Mr. Bryan has not considered his monograph of sufficient value to furnish it with an index. Except for the guidance given by the chronological order there is no possibility of looking up in its pages any special case.

§

New Poems. By Stephen Phillips. New York: John Lane Co. \$1.25.

To those who believe that Mr. Phillips's dramatic efforts represent a false tendency of his genius, this issue of a new volume of verse will be particularly welcome. Like most of his poetry it is characterized by that classical affectation—we hardly know how else to name it—which is a curious symptom of what Taine would call the present literary "moment." To be sure there is something about the spirit of these after-writers, including Mr. Phillips, which might be designated generically as *Alexandrine*; but there is also an additional element quite foreign to a Theocritus—an element of *Traumerei*—something vague, elusive, not to be caged, which gives this poetry its charm as well as its weakness.

A History of English Journalism to the Foundation of the Gazette. By J. B. Williams. New York: Longmans, Green & Co. Pp. xi, 293. \$3.

Monographs covering particular periods or special aspects of English journalism are published at fairly frequent intervals. A little while ago a contribution of this kind of much value was issued in the Harvard Historical Studies—the work of Dr. Clyde A. Duniway, of Leland Stanford University—in which the constitutional history of the English press up to the breaking away of the American colonies was traced with completeness and success. Mr. J. B. Williams's *History of English Journalism* is another valuable contribution to the accumulating material that is awaiting the man who is disposed to write the full and comprehensive history of the English press for which students of constitutional history are waiting. Like Dr. Duniway, Mr. Williams is concerned only with the early history of the press, for his story begins with "A Currant of Generall News," which was issued in London in May, 1622—the first English news book—and is brought to a close with the establishment of the *London Gazette*, previously the *Oxford Gazette*, in 1665. Only forty-three years are covered in Mr. Williams's volume. But these were eventful and stirring years in the history of English journalism, and it is impossible to suggest an aspect of journalism—constitutional, political or personal—that is not adequately dealt with in Mr. Williams's pages. First-hand material has been almost exclusively drawn upon, with a resulting freshness to the story. It is well told from beginning to end; and not the least interesting part of it is Mr. Williams's sketches of the men—some of them not very reputable—who in these early days were putting their wits into the making of these newsbooks and newspapers. Newspaper advertising is nearly as old as the English newspaper press, for the first advertisement appeared in 1625, and by 1649 advertisements were universal in the London news books. The vendors of quack medicines were almost the first advertisers to cultivate the new opportunities that were offered by the development of

the newspaper press, and for a long time among tradesmen they had the new field to themselves. The only other advertisers were employers, not seeking new or additional help, but on the hunt for runaway servants and apprentices.

✱

The Moral Economy. By Ralph Barton Perry. New York: Charles Scribner's Sons. \$1.25.

The American college has long been in need of an ethics text-book which would appeal not only to special students of philosophy but to all college men. All our students are preparing themselves for life in a world where they must grapple with ethical problems of vast import and of tremendous difficulty and complexity. And in college itself the student comes into contact with questionable and often with positively bad ethics. He sees the college president lobbying for an appropriation from the Legislature or soliciting gifts of "tainted" money; he sees college advertising which is undignified and sometimes dishonest; he notices that the faculty is sometimes timid in dealing with breaches of discipline; he is urged to take part in a corrupt system of athletics; and, most fundamental of all, he has his own personal, daily recurring problems of simple honesty, industry, chastity and humanity. The old dogmatism which guided a man thru life by condemning certain modes of conduct without being obliged to answer why, has lost its hold upon students just as it has lost its hold upon other men. Ethics needs a new mode of appeal which will reach not only every student but every rational human being. In face of this critical situation, what have our college teachers of ethics been doing? They have been complacently drilling their students in subtle scholastic distinctions between "hedonism" and "transcendentalism" and what not, confirming their minds in the belief that there is no sound, unequivocal basis for morality at all. What the student really ought to get from the study of ethics is a clear and firm conviction that the basis of morality is rational and certain, not dogmatic and arbitrary, and that it is so simple as to be easily grasped by any man of responsible mind. Professor Perry, in this little book, succeeded in

putting ethics on such a basis. His point of view may be illustrated by a few quotations:

"To be moral is simply to be intelligent, to be right-minded and open-minded in the unavoidable business of living. Morality is a collection of formulas and models based solidly on experience of acts and their consequences." "Morality is the one interest that virtually represents all interests." "Morality is simply the forced choice between suicide and abundant life." "The first grumbling truce between savage enemies, the first collective enterprise, the first peaceful community, the first restraint on gluttony for the sake of health, the first suppression of ferocity for the sake of a harder blow struck in cold blood—these were the first victories of morality." "Morality is only the method of carrying on the affairs of life beyond a certain point of complexity."

India: Its Life and Thought. By John P. Jones, D. D. New York: The Macmillan Company. Pp. xvii, 448. \$2.50.

Dr. Jones has fitted himself to write on Indian life and thought by a third of a century spent in the country in continuous effort to understand and sympathize with the people whose uplifting he has made his life work. Loving sympathy is visible in every page, and the understanding that can come only from love makes Dr. Jones's pages a new revelation of the East to the West. Yet Dr. Jones makes no large claim for his ability to make India intelligible to men of Anglo-Saxon blood. After thirty years in constant touch with the people, eagerly studying their life and thought, he owns to oft-recurring surprises still brought to him by Oriental life and nature. Dr. Jones writes frankly from a Christian point of view and his great sympathy with the Indians does not lead him to overlook the awful evils of their religious and caste systems. He does not minimize the state of unrest which exists at present in all departments of Indian life. Yet he maintains that so far the unrest has been confined to the small class of Indians who have graduated from the university, and not finding any scope for their talents in the service of the Government, have become dangerous demagogues and fomenters of sedition. Nine-tenths of the population of India, he asserts, are satisfied with the Government and have no desire to change the present order.

Mendel's Principles of Heredity. By W. Bateson. London: George Allen & Unwin, Ltd. Putnam's Sons. Pp. 396. \$3.50.

Some seven years ago, when the re-discovery of the remarkable papers by the Austrian monk, Gregor Johann Mendel, on inheritance in certain hybrid plants was a recent event, Professor Bateson published a little book with the title: "Mendel's Principles of Heredity: a Defense." The present work is the successor to this first book on Mendelism; not an ordinary "second edition," but a developed, aggressive, even—by its own token—triumphant successor. For Mendelism, according to Bateson, no longer needs any defense; rather is it time now to take the offensive and challenge the world to fetch forth any phenomenon of heredity whatever which does not fit into the Mendelian formulæ. The constructive aim of the book is to show the futility of accepting such a challenge by cataloging and elucidating the various results which have been obtained to date by workers along Mendelian lines. These results make an imposing mass of data. Research has been particularly active in this field, and whether one at all times agrees with the Mendelian interpretation or not it is undeniably of the greatest value to the progress of biology to have such an enthusiastic and zealous band of workers piling up facts about the most fundamental and intricate phases of natural inheritance. Bateson's well illustrated and arranged summary of these facts is particularly useful as a work of reference for the biologist who is able to discount properly the too frequently exaggerated form of statement engendered by great enthusiasm and zeal for the cause. For while it will give the layman the best existing summary account of the known facts of Mendelian inheritance, it will tend to create a biased impression as to the present state of conservative, critical biological opinion regarding the theoretical significance and generality of these phenomena.

Salvage. By Owen Seaman. New York: George Holt & Co. \$1.25.

English has a long and honorable tradition of humorous verse, which Owen Seaman not unfitly continues. Those who have enjoyed his parodies

will not be disappointed by these skits, in independent vein, gathered most of them from *Punch*, for whom the writer seems to have acquired with reasonable success

the art of being funny.
Funny once a week.

Literary Notes

.... Alfred Bartlett, of Boston, is issuing a little book of verse by Sara Hamilton Birchall, under the title of *Songs of Saint Bartholomew*. The volume breathes of outdoors, of the woods and the fields, of wood folk, fairies and dryads. The little blind god wanders in and out of the verses and if the lines do not rise to very sublime heights they by no means sink down to the depths.

.... The first number of *The American College*, considering that it is a first number, presents a creditable appearance and seems to have a field of usefulness. Its policy may be inferred from the quotation from the *Columbia University Quarterly* with which the first editorial begins: "The question is really not whether there should be radical changes in the American college, but what changes should be made." The leading articles are a plea for better methods of accounting and bookkeeping in colleges by Clarence F. Birdseye, and a defense of university teaching by Edwin E. Slosson, against the sensational attacks made by Harold Bolce in the *Cosmopolitan*. (Pub. by Higher Education Association, New York).

.... Besides condensing into a short and entertainingly readable account all the facts to be found in Hudson's authoritative biographers, Thomas A. Janvier in his *Henry Hudson: a Brief Statement of His Aims and His Achievements* (Harpers, 75 cents) has made a valuable addition to Hudson memorabilia by publishing for the first time a newly discovered partial record of the trial of the mutineers by whom Hudson and several shipmates of his last voyage were abandoned to their death in Hudson's Bay in the summer of 1611. Heretofore the only source of information concerning the mutiny on board the "Discovery," which resulted in the murder of Hudson, has been the "Larger Discourse" of Abacuck Prickett, one of the mutineers; Mr. Janvier gives us not alone the sworn testimony of Prickett, but also that of five of his fellows recovered from contemporary documents which had lain hidden for three centuries in the Record Office in London. Thus the fact is established that the mutineers were brought to trial, tho as yet there is no clue as to whether they were ever punished. Altogether, aside from its merit of timeliness, the little book has a real and permanent value for all admirers of the brave explorer and great discoverer.

.... A critical edition of the Septuagint text is now in preparation and well under way. Prof. A. Rölle, who has taken up for the Association of Sciences in Goettingen, Berlin and Vienna this work begun originally by the

great savant de Lagarde, now reports that the whole manuscript material in a dozen languages has been thoroly sifted, and the settlement of the text has begun. The Papal commission appointed by the Vatican for the revision of the Vulgate text, with Dr. Don Gasquet as chairman, will co-operate, examining fragments of the Latin texts that have been derived from the Septuagint.

Pebbles

"Did you take a bath?"

"No, is there one missing?"—*Columbia Jester*.

HE UNDERSTOOD

"I have often marveled at your brilliancy, your aptness at repartee, your"—

"If it's more than five dollars, old man, I can't do a thing for you. I'm nearly broke myself."—*Houston Post*.

A DOUBLE-SIDED HOLE.

The latest story of German "thrift" is told at the expense of the proprietor of a circulating library, who charged for the wear and tear suffered by his books at the hands of his patrons. One volume came back to his scrutiny. "See here," he exclaimed, "there is a hole on page nineteen of my beautiful book. And see here," he went on, turning over the leaf, "there is another one on page twenty"—*The Argonaut*.

THE story of a certain bishop—of what Church I know not—points this characteristic. The dignitary in question was a trifle deaf. Once while attending a banquet he was assigned to a young lady who did not know of his affliction, with the result that conversation was found to be somewhat difficult. In a burst of enthusiasm the young lady inquired: "Bishop, do you like bananas?" At first the prelate did not reply, but upon the question being repeated he admitted confidently: "I must say I still prefer the old-fashioned nightgown."

TOOK HER AT HER WORD.

A woman came into the general store with a jar of butter. She desired to exchange it for another jar of butter. In churning her butter she had discovered a mouse in the churn.

"It didn't injure the butter," she said to the store keeper, "and to any one who did not know the circumstance it would taste all right."

Taking the woman at her word, the merchant carried her jar into the back room, transferred her butter to another jar, and the gratified customer took back her mouse butter with a thousand thanks for the accommodation.

There is a great deal of needless trouble in the world on account of squeamish sentiment. *Wikaauke Journal*

A WEEKLY MAGAZINE. FOUNDED IN 1848.

One Year, \$2.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, \$1.75 a year; extra to Canada, \$1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of *The Independent* are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with \$1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

Minnesota's Favorite Son

GOVERNOR JOHNSON died last week at the early age of forty-eight. His death is a great sorrow to the State which gave him extraordinary confidence and love and to the nation whose wider service he was likely to attain.

The fortune of birth did not seem kindly to him. He was not, like Vice-President Henry Wilson, brought up in an alms-house, but his father, an unfortunate dipsomaniac, died in an alms-house, and his brave mother provided for her children by taking in washing. She kept her children in school until John, the oldest, left school at twelve to help support his mother and himself at ten dollars a month. That was all the schooling he got, but he was a reader as well as a worker, self-made if ever man was. He devoured all the books in the local library, rose from one employment to another, supported his mother and educated her children, and at the age of twenty-five was asked, without any journalistic experience, to become editor of the home paper, the *St. Peter Herald*. From this time his political advancement was rapid and easy.

Fortune had done nothing else for him

but to give him Scandinavian parentage, and Minnesota is full of Scandinavians who have a just loyalty to their race. Nature, however, had given him brains, and he had learned for himself faithful diligence and honesty, and these will make up for any lack of fortune. It makes little difference to a man's future whether fortune has done much or little for him, if he only has natural parts and acquired persistence. Among our Presidents we match Lincoln and Johnson and Grant, for whom fortune did little, against Washington, the Adamses and Roosevelt, for whom she did everything. Even rich men's sons can succeed.

As a young man John A. Johnson was a Republican, but when he began to study the tariff question he joined the Democrats in a State that was solidly Republican. Nevertheless he was elected to the State Senate in 1901, and so made his mark that in 1904 he was Democratic candidate for Governor and was elected, altho at the same time the State gave 161,000 majority to Roosevelt. Our people are getting into the good habit of separating their State from their national politics. Two years later he was re-elected, and in 1908 elected for the third time. He is the only Governor of the State who has had such honor of re-election, and the only one who was a native of the State he ruled.

We might not call Governor Johnson a superlatively great man, but he had fine abilities, great practical sense, was a good speaker, and carried the conviction that he was thoroly honest in his appeals to the people. He had not that magnetic quality which distinguished James G. Blaine, and his followers loved him intelligently rather than passionately. He took up the policies which his State needed. He opposed corporate abuses, favored a State income and inheritance tax, sought to extend State control over street railways and telegraph and telephone lines. He was bitterly opposed to railway passes, sought the reduction of railway fares, favored municipal ownership, the initiative and the referendum. He was a full representative of those policies which both parties are pressing in the West, and was one that educated both parties, and so both parties adopted him. At the same time he was consist-

ently fair in his appointments to office, not using his power of patronage for political ends. He was a fit candidate for the Democratic nomination for the Presidency, and was Mr. Bryan's chief rival. He had every promise of getting the nomination in 1912, after Mr. Bryan's third defeat.

In his address in Boston before starting on his present tour President Taft criticised a late speech of Governor Johnson, in which he had said that "it is time for the West to throw off the shackles of the East." It had a sectional sound, and Mr. Taft said no more than the truth when he reminded his hearers and the country that States have equal rights in the two Houses of Congress, and that it is impossible for one section to dominate over another. But Governor Johnson meant no ill will to the East. He was calling on his people to stand by their own interests as farmers and consumers, and not to be tied to the skirts of a party whose interests are not their own. He spoke patriotically, as did also President Taft; and had Mr. Taft known that the next day Governor Johnson was to suffer a fatal operation he would not have said what he did. He gave Governor Johnson the heartiest appreciation and praise when his death was announced.

Such citizens are the nation's best dower. He was one striking proof out of many of the value to us of our Scandinavian heritage. The breed of able men is found in many races among us, but in none is it more choice than among the hardy sons of Norway and Sweden.

President Eliot's New Religion

WE did not wish to judge ex-President Eliot's excursion into prophecy and religion hostilely or unfairly, and have therefore waited to see the full text of his lecture on "The Religion of the Future," delivered two months ago at the Harvard Summer School of Theology, and now printed complete in the *Harvard Theological Review* for October. It is well worth reading, and not wholly easy to grasp.

In discussing this lecture let us begin by saying that religion is, properly, a branch of ethics. Ethics embraces the whole sphere of duty—duty to whatever

being exists or may be supposed to exist, duties to one's self, to other human beings or creatures less than human, to the material world, if such duties there be, and to other spiritual beings which exist or are supposed to exist. Religion is that branch of ethics which has to do with our duties and relations to the invisible Power, or powers, above and about us. These duties may be directly to God, or saints, or angels, or demons; or they may be to our fellow men because they are so required by God's will and command. Thus religion and ethics may cover the same field, for what is duty to man may also be duty to God. It is hard to separate them, and one who believes in God cannot say of any duty that it is not a part of his religion. The duty done for its own Stoic sake and the duty done for religion's sake are objectively the same thing, both virtuous, tho possibly having different grades of virtue as their motives are more or less exalted.

Ex-President Eliot's religion is a real religion, altho the philosophically ethical phase of it is more marked than the religious. He believes in God, a personal God, at least after a sort. He says of his religion of the future:

"It sees evidence in the moral history of the human race that a loving God rules the universe."

This God we must think of in much the same way that we think of the intelligent and moral men we know:

"As the best and happiest man is he who best loves and serves, so the soul of the universe finds its perfect bliss and efficiency in supreme and universal love and service."

Here he calls God "the soul of the universe," and gives to "it" affections and activity. The nearest definition of the new religion is found in this compact epitome:

"The new religion prepares as a basis of unity, first, its doctrine of an immanent and living God, and, secondly, its precept, 'Be serviceable to fellow men.'"

But, more nearly, what is this God whom Dr. Eliot thus affirms has intelligence and affection, but who is yet "immanent" as "the soul of the universe"? It is hard work for those who are untrained in the new theologies to get an exact meaning of this new word "immanent" as distinguished from the old

"omnipresent." Our lecturer does not make it clear whether, when he makes God immanent in everything, he also makes him do everything, altho he does deny "second causes," but he does not sink God into the mist of pantheism. He thus gives the "new thought of God":

"The God will comprehend the Jewish Jehovah, the Christian Universal Father, the modern physicists' omnipresent and exhaustless Energy, and the biological conception of a Vital Force. The Infinite Spirit pervades the universe, just as the spirit of a man pervades his body, and acts, consciously or unconsciously, in every atom of it. The twentieth century will accept literally and implicitly St. Paul's statement, 'In him we live and move and have our being,' and God is that vital atmosphere or incessant inspiration. The new religion is therefore thoroly monotheistic, its God being the one infinite force."

There is here a great emphasis on immanence, attractive to the physicist's law of atomic energy, but it is a doctrine neither of materialism nor of pantheism. It gives the basis for religion, whether Christian or other.

To this we add that ex-President Eliot's exposition gives scope to human dependence on God. It might properly allow prayer, but not prayer for objects that come under the laws of nature—he expressly excludes that, altho the reason is not clear. As any man can divert the operation of the laws of nature, we do not see why a personal God cannot do the same.

Ex-President Eliot's new religion finds its chief essential in service to one's fellow men. As this is of the essence of the Christian religion as usually expounded, this predominant element needs no further consideration than simply to recognize it.

The chief recognition of Jesus in this religion of the future we find in the concluding paragraph:

"Finally this twentieth-century religion is not only to be in harmony with the great secular movement of modern history, but also in essential agreement with the direct, personal teachings of Jesus, as they are reported in the Gospels. The revelation He gave to mankind thus becomes more wonderful than ever."

This is guarded and goes no farther than everybody is willing to go.

If this were all there could be little reason to criticise, for it gives a fair expression to natural religion and natural virtue, both in their essential elements:

and we cannot doubt that one who thus accepts the rule of the Fifteenth Psalm and the eleventh commandment is accepted of God, even if he goes no farther. Indeed, all that is beyond this is theology and not religious or Christian life. But in a number of particulars Dr. Eliot takes pains to condemn what he assumes to be the current Christian theology.

He says that "the religion of the future will not be based on authority either spiritual or temporal." What he means by temporal authority in religion we do not understand, but we know that he is right and herein agrees with Paul, who bade us "be able to give a reason for the faith." We all depend more or less on authority, but we first have a reason for it. He is more definite:

"The authority both of the most authoritative Churches and of the Bible as a verbally inspired guide is already greatly impaired."

We admit that it is not only "impaired," but verbal inspiration went long ago.

Again, he says that faith in fairies, imps, nymphs, demons and angels declines and fades away. Here he doubtless tells the truth. There is less belief in them. We do not concern ourselves as much about angels and the Devil as Saint Antony or Luther did. Whether they are personal or are impersonations, we have to do chiefly with the virtues or the sins which they represent.

Next the Unitarian doctrine is announced:

"There will be in the religion of the future no worship, express or implied, of dead ancestors, teachers or rulers . . . no identification of any human being, however majestic in character, with the Eternal Deity."

This is intended to deny the doctrine of the Trinity and worship paid to Jesus Christ as both God and the Son of God. He speaks of "the numerous deities revered in the various Christian communions—God the Father, the Son of God, the Mother of God, the Holy Ghost, and a host of tutelary saints." When he denies "any sort of magic, or miracle, or other violation of or exception to the laws of nature," he certainly means to deny the resurrection of our Lord.

Herein is the crux of Dr. Eliot's attack on current Christianity—he is a Unitarian. With the denial of the Trin-

THE LATE GOVERNOR JOHNSON IN HIS OFFICE AT THE STATE CAPITOL AT ST. PAUL, MINN.

ity goes the vicarious atonement and the redemption from Hell. Yet it is to be said in defense of the accepted doctrine that nobody does or can understand it. The divine nature, its internal constitution, is beyond us. We have as good a right to think of it as in some way three-fold as as we have to think of it as absolute and unitary. We can think of God in Christ, and when we worship Christ it is the God in Christ, not the man in him, that we worship. If it said that such worship of God in Christ might allow the worship of God in the image of a saint or an image of Buddha, we admit it. There is no real wrong, and sometimes much help, in worshiping God thru an image or a picture if one feels that he is worshiping God and not the fetish object before him. Was God in a special way in Jesus? That is a question for evidence, and there is reason to believe it.

Apart from this central point, the larger part of ex-President Eliot's affirmations are either philosophical, such as immanence and the denial of "second

causes," or are the commonplaces of present-day theology. Much is well said about anthropomorphism, cheerful religion, the Universal Father, the gradual revelation of God to humanity, divine justice, brotherliness and the passion for truth.

We do not accept either Dr. Eliot's religious philosophy or his theology; but we do not revile him as no Christian. A man can be a Unitarian and a good Christian; *probat ambulando*; look at Dr. Eliot and his minister son, and at Edward Everett Hale and a multitude of saints who have cried, "Nearer, my God, to Thee." If they do not discover a mystical union of God in Jesus and thus a Second Person in the Trinity, they yet reverence and follow the Jesus they see, "the revelation He gave to mankind," and they worship the one God thru whom that revelation came. Dogmas are taking new alignments of value in these days, and we are seeking more fellowship with all those who accept the first and the second great command of the Law; and one of them is Charles W. Eliot.

Errant Anniversaries

At a cost of several million dollars several million people have it firmly impressed upon their minds that in 1809 Robert Fulton steamed up the Hudson River in the "Clermont." Of course it is not so, but it is too late to attempt to correct it now when the rising generation have been made to believe it. It would be less trouble to change the original date than to change the minds of so many people. There are few things more difficult to do than to eradicate a misconception which is rooted in millions of memories.

The only reason for an anniversary celebration anyway is to fix a date, to connect a past event with a particular point in a person's life. In our strenuous efforts to teach history to the masses by this means we have been pretty careless as to what dates we fix. Just as the churches established feasts, processions and pilgrimages in honor of the relics of the saints without caring much whether the relics are genuine or fictitious, so we held expositions in commemoration of historic events at any time that is convenient. All of our world's fairs were arranged to teach falsehoods. On July 4, 1876, we invited all the nations of the earth to join with us in a great centennial jubilee at Philadelphia, altho nothing of any particular importance was known to have happened in that city on that day a hundred years before. Every year we reiterate the blunder by sending up sky-rockets on this false anniversary of a fictitious scene.

We may forget when Columbus discovered America but never when we went to the Chicago exposition, at least if we were young at the time. So we know that America was discovered in 1493. If a date in history and a date in our own lives come into conflict it is the former that must give way. Even rime, which is the next best way to memorize an arbitrary number, is less effective than a celebration. We may have committed to memory in plastic infancy the couplet:

"In fourteen hundred and ninety-two
Columbus sailed the ocean blue."

But the subconscious mind, who is the

archivist of our memories, sometimes usurps the functions of his superiors and falsifies the records to suit our supposed desires. So when we call for the original document to verify the date we may get:

"In fourteen hundred and ninety-three
Columbus sailed the dark blue sea."

Our third international exposition was the largest of all and was successful in diffusing thruout the country the idea that the western half of the United States was acquired in 1804, instead of 1803, as was supposed before the St. Louis fair.

Not that it matters much to ordinary people when it happened. Why should we trouble to make dates agree with the calendar when the calendar itself is set four years behind time, more or less. But *vox populi vox Dei* and neither pope nor higher critics could make us believe that Christ was not born on the 25th of December, nineteen hundred and nine years ago. We, each of us, have presents and pleasant memories to prove it.

Our centenary habit is due to the mere magic of numbers. The old method of marking eras by the accession of kings was much more rational, for a change of rulers does often make a difference with the character of the times while a change of figures has as little influence over us as crossing the 180th meridian. There is a difference between Elizabethan and Jacobean literature, but *fin de siècle* and Twentieth Century literature are separated only by an imaginary line.

Multiples of ten, which mean so much to us, have no preference in nature. The heavenly bodies got set in their habits long before man appeared on the earth and they refuse to adapt themselves to his ten fingers. The French revolution reformed the weights and measures but it failed in its attempt to reform the calendar. The prevailing chaos of units of length and mass under which we still suffer but from which the metric system freed continental Europe, was not a primeval chaos. It was the creation of men, and could therefore be altered by men to suit their convenience. But no revolution can do much for the reform of the calendar tho we might even up the months a little. The metric system cannot be applied to it nor can any other that

man will ever be able to devise. Our three units of time, the day, the month and the year, 'are fixt and incommensurate.

The Price of Peace

GREAT guns from little steamboats grow; this may seem to be an obvious moral from the Hudson-Fulton Celebration, with its assemblage of the navies of the world, but we do not concede that it is the true one. That naval power has increased, step by step, with the expansion of commerce since the application of steam to navigation is a fact that may be deplored without admitting that the enginery of war is the biggest thing that the modern world has to show for the daring and the sacrifices of its navigators and inventors.

Nevertheless, we do not see how a thoughtful man can reflect upon the elements of this present "greatest show on earth" without asking, "How long, O Lord, how long" before civilization, so yclept, shall expend a smaller proportion of its resources on the wherewithal to work its own destruction. That the problem is one of immense difficulty no men know better than those who are devoting their lives to the advocacy of peace. The population of the earth is not yet composed mainly of the reasonable, the self-controlled, the magnanimous. Stripped of the jargon of the schools morality consists in keeping the civilized man in each individual nature on top of the savage that survives in us all. In this sense, we profoundly believe, the world is becoming more moral, but the grip of civilization on slumbering savagery sometimes slips or weakens, and when the savage gets on top, he sets out to kill.

In the moral struggle that must go on between an inherited past and the unfolding future men of knowledge and resourcefulness must work for peace chiefly by aiding a wise direction of the forces that restrain selfishness and savagery. That an unscrupulous competition for material gain makes directly for war, no one not wholly ignorant of history can

doubt. If war is to be discouraged the advocates of peace must do more than talk about it, and more than create tribunals for international arbitration. They must work for those policies which subordinate an individualistic scramble for wealth to considerations of the general good. They must help to establish social usages and legal institutions which will compel men at every hour of their working lives to remember that they pursue gain and renown, subject to a social control.

The present day apologists for great armaments build on the peculiarly dangerous fallacy of the half true. They say in effect: "Modern warfare is less a brute encounter than a game of skill in playing a hand at poker. A good player does not bet against 'a full house' or 'a royal flush.' An up to date enemy does not attack a line or a redoubt that he knows in advance is invulnerable. Therefore be invulnerable." So far good. If every gambler at the table held a royal straight flush the betting would stop. If every navy was invulnerable and every army unconquerable, war would stop.

No nation can make itself invulnerable and maintain itself at that exalted military height; for, in the attempt, it must exhaust itself, and fall an easy prey. War calls for "munitions," and the price of munitions is the devotion of a busy population thru long years to the arts of peace. But it should be possible to make the nations invulnerable against the assaults of that lingering savagery that thirsts for the blood poured forth in war. This is the whole truth of which the armament argument is the perilous half.

The way to achieve this practicable invulnerability we have indicated. If the savagery within civilized man is to be restrained from the rioting of war it must be restrained from rioting as a daily exercise in the unscrupulous pursuit of gain. If the modern pursuit of gain were not to an alarming degree unscrupulous the world would not at this hour be apprehensive over the strained relations of Germany and Great Britain. The danger, as all the world knows, has grown out of no other cause whatsoever but a commercialism which, benign in itself, has become hostile to peace because it has

followed, and been permitted to follow, the relentless and merciless methods of war.

The Dramatic Critic and the Trust

FOR many years a bitter war has been fulminating between the theatrical trust and the dramatic critic. The public has only received vague knowledge of the potency of the manager and has hardly regarded the critic as much more than a theater reporter. The course of the struggle has been marked by the retirement of Mr. Norman Hapgood from the *New York Commercial Advertiser*, now the *Globe*, Mr. Walter Eaton from the *New York Sun*, and Mr. William Winter from the *New York Tribune*. The resignation in each case was accompanied by ugly rumor that the theatrical syndicate had demanded their release, a demand whose right was claimed as a concession to advertising.

In a previous editorial, we have said that this condition involves the large field of ethics in journalism.

This much is necessary to know in order to understand the present condition. The growth of the Theater Trust has resulted in an assured banking system which has raised the actor's profession above vagabondia, which has brought into solvency most factors connected with the running of the theater.

But inevitably, where one deals with art as a commodity, a point is soon reached where the two factors come into opposition; the Trust is face to face with a moral problem, incompatible with its business principles.

A large item on the ledgers of every theater manager is the advertising expense; the theater commodity must be made known to the public in exactly the same way as Sapolio is made familiar to the housewife; stray fences must be plastered with posters and lettering; the newspapers, each day, must have a sign post which turns the transient to the theater doors. The Trust has well organized its press department, so well that it furnishes material to a chain of papers from New York to San Francisco. A large per cent. of the theater

news printed in the Sunday newspaper, emanates from the cleverly facile brain of the press agent, who is either a paper reporter, lured into the theater business because of higher pay, or else a defunct dramatic critic.

Now, the newspaper is beholden to the theater for three things—first, for an occasional "story," which is out of the province of the critic's department, however conflicting with it; second, for the privilege of the theater "pass"; and third, for advertising, amounting to many thousands of dollars a year. It is difficult to measure what the paper gives in return; a large proportion of the theater audience represents interest created by the theater columns of the press.

But the manager, from his business standpoint, as well as because of the fact that his press agent has been doing much better work than the average newspaper reporter, is beginning to demand that nothing be printed by the newspapers accepting his paid advertising, to thwart the full force of that advertising. From this point of view, his bulwark of attack is the dramatic critic, who either has been antagonistic to the Trust's methods, or particularly caustic regarding the moral tone of certain "shows."

So long as a writer contents himself with the truth of a situation, speaking from fearless and honest conviction, he is within the realm of legitimate criticism; let him descend to personalities, or to an attack on the individual, and he should instantly be deprived of his prerogative. It is a certain sad commentary on the part of some of our journalist editors, that they have not been over-careful to limit the functions of criticism until impelled to do so by the financial end of their office. The theater managers have a right to protest on this line.

Again, there are two functions of the dramatic critic on the newspaper: First, to report a play, that is to give an adequate account of the story and of the acting, and second, to examine more closely the structure of the play and to question its purpose and its need. Some critics have reserved the last function of their office for the Sunday issue—in an article demanding more attention than

they could give between the hours of midnight and two on the morning after a "first production."

If, therefore, conditions are such that dramatic opinion cannot be uttered in conflict with the advertising column, what is to become of the dramatic critic? The newspapers have put the stigma upon him; he is no longer to be trusted; even the actor regards him indifferently; he is a "barker" to supplement the press agent. One remedy would seem to be to remove criticism from the realm of newspaperdom to that of the magazine. Such a step would take the critic away from the current demand of advertising, for the magazine is not dependent upon the publicity patronage of the theater. This would not be the only time the weekly and monthly press have been forced to assume the functions of the daily paper. The methods commonly described under the title of "muck raking" should have emanated from the newspaper press, but "special interests" prevented an outspoken attack on corporations.

But the magazines as yet, are scarcely more reliable. They are filled with pictures and with half truths, arranged by the press agent. The magazine editor still regards the stage as a tinsel house, not much raised above the "Punch and Judy" show of his boyhood.

There is fault on all sides: the press, the critic, and the Trust are all in a way culpable; they each have a tenable grievance. Art has ever been handicapped by a close corporation; one of the evils of the trust is this very fact. But to abolish the Trust, without something to take its place, would be to thrust the theatrical status into chaos; it is a necessary phase through which the theater has to pass. The situation must be met, however, by intelligent investigation and co-operation. Art and business may be reconciled, the same as dramatic criticism and advertising may be divorced. The manager is morally wrong in his attempt to coerce freedom of speech through the pocketbook. He is right to object strenuously to personal vituperation. The critic, if he is to exist, must have the moral backing of the paper he represents, but he must, himself, be competent and responsible.

The Revision of the Vulgate

OUR readers know that the revision of the Vulgate, on which work an imposing Papal Commission has been engaged for two years, does not at all contemplate any corrections from the original Hebrew and Greek texts, but solely by collation of Latin manuscripts, to secure the nearest possible approach to Jerome's translation as it left his hand. Such a revision after the Hebrew and Greek, such as Protestants have, may come later.

From an exceedingly interesting and instructive document which has lately been published by the Tipografia Pontificia dell' Istituto Pio IX in several languages, we gain an official account of what this Commission has been instructed to do and what it has done so far in the matter.

This *Commissione per la revisione della Volgata* particularly declares that it has been directed only to restore in a critical way the text of St. Jerome, but not in any way to offer its readers a new text. In this connection it, however, makes the interesting revelation that its work is to be regarded only as preliminary and preparatory to that of a commission to be appointed later, and which shall have for its purpose to examine into the merits of the Jerome text itself, which would seem to mean that the Vulgate is to be revised on the basis of the original text.

This report is filled with interesting data and details concerning its work. Its headquarters are in the International College of the Benedictines, St. Anselmo on the Aventine, in Rome, of which two photographs are given. Four or five other illustrations show proof sheets of the Bible, of which 240 copies have been made on different kinds of paper for the collaborators. Two-thirds of the pages is blank, the text without capitals, or punctuation, or division of syllables. In the case of the Psalter that which is common to the Roman and Gallican texts is given, the variants to the right and left, and the Hebrew on separate sheets. Fifteen assistants are already engaged in different countries in examining the chief Vulgate manuscripts, and one member of the Commission itself has been at work in Spain for several months in sys-

tematically examining the libraries and the cathedral archives. A catalog of all the Latin Bible manuscripts in the libraries of Europe is in preparation. The Commission states that it will cost about 25,000 francs per annum to defray its expenses and that it will take from eight to ten years to complete the work, and believes that this sum, altho considerable, should be promptly subscribed by Catholics, since Professor Von Soden, of Berlin, was able to secure from a single Protestant lady the sum of 400,000 marks for his work in revising the Greek text of the New Testament. So far about one-fifth of the 250,000 francs needed have been secured, the Holy Father heading the list with 12,000 francs.

In speaking of this work and this report, Professor Eberhard Nestle, the leading Protestant specialist in this department, expresses his regret that this document as published is so full of blunders. He adds, not quite generously:

"Germany still has reasons as in the sixteenth century to complain of Catholic negligence in these matters; but this task we will leave to German Catholics. We can only regard with good wishes this work of revision, as it has to all intents and purposes been Protestant Biblical scholarship that has brought this whole movement about."

Polar Ethics It is of no great importance to the world which of two men was the first to reach the Pole, nor is it of vital importance to either of the claimants that his claim be accepted. But it is of vital importance that they should show themselves generous and manly. We have been reticent on the subject of the charges of falsehood and imposture made by Commander Peary against Dr. Cook, but we do not feel inclined to be longer silent. The last word from Mr. Whitney confirms the impression received from Commander Peary's utterances, that he is consumed by an unworthy jealousy which warps his judgment of what is either true or right. We learn from Mr. Whitney's telegram to Dr. Cook, and from the correspondent of the *Herald* with Mr. Whitney, that when Peary allowed Mr. Whitney to sail with him on the "Roosevelt" he refused to permit him to take with him the in-

struments and any other things committed to his care by Dr. Cook, and he was obliged to leave them cached at Etah. He was not allowed even to take the sled Dr. Cook had given him. This is nothing other than petty spite against the man who claims to have anticipated him, and must have been meant to do an injury. This is a matter of morals, and morals is more than discovery. Mr. Whitney has no doubt that Dr. Cook reached the Pole. We feel compelled to say that thruout this unfortunate business Dr. Cook, assuming, as we do, his claim to be true, has spoken and acted like a gentleman, while Commander Peary has acted quite otherwise. An old rhyme tells us:

"Were I so tall to reach the Pole,
Or grasp the ocean by my span,
I must be measured by my soul;
The mind's the standard of the man."

Disfranchisement in Maryland Probably the worst, most unjust provision to make fraud easy and to disfranchise voters ever devised to put in a constitution is the amendment which the voters of Maryland are asked to adopt on November 2 next. It has grandfather clauses, but we are used to that, bad as they are, for they give the vote to those who can prove they are male descendants of those who had the right to vote in 1869, the idea being that this can be made to exclude negro voters. If he does not come under this provision or can't bring the receipts to prove that he has for two years paid taxes on \$500 of property, the applicant must, with pen and ink, and with no memorandum or help from anybody, answer from memory thirteen questions. They would tax the knowledge and memory of any intelligent man. He must tell the names of all his employers for the last two years, the "names in full" of one justice of the United States Supreme Court, of the Governor of Maryland, of one of the judges of the Maryland Court of Appeals, of the Mayor of Baltimore or of one of the County Commissioners. Every answer must be given "correctly," every name must be "in full." The Mayor of Baltimore is usually called Barry Mahool, but "correctly" it is J. Barry Mahool. The proposed amend-

ment is utterly undemocratic, and if honestly applied would exclude half the white voters. But that is not the purpose; only to exclude the colored Republican voters.

✱

Revolution in Great Britain

Mr. Balfour talks much about its being a revolution that the budget

should put the burden of the taxes on the rich landholders, the dukes and lords, and Lord Rosebery and Joseph Chamberlain follow him and hope the Lords will refuse to accept the bill. To reject the bill would be even more of a revolution. But equally revolutionary, in a country which has no written constitution, and all the constitution is merely old law and custom, is the alternative proposal now fully accepted by Mr. Balfour, to adopt the high tariff policy in place of free trade. By its fearfully expensive naval enlargement Great Britain is compelled to get somehow an enlarged income, and the choice is between taxing imports and taxing land and imposing death duties. The latter seems revolutionary because the landholders have escaped their share of taxation and they will feel the new tax, as they ought to. If you must make the navy equal to the two biggest other navies in the world you must pay for it, and wealth should pay. The old entailed estates were never bought, but were paid for in other men's service, the service of serfs in the King's army, and their wealth is the wealth of the people and should pay roundly. An import tax will fall most heavily on the poor, for England's imports are not chiefly manufactured products, but food-stuffs—wheat, tea, coffee and sugar—and the cotton and wool which the mills manufacture for the people to wear. England has got rich under the policy of free trade, and in order to save their share in the taxes the wealthy classes are trying to persuade the people that British industries now need protection. But a tax on flour and tea protects no industry.

✱

"Per Mortem Exterminandum"

We called attention some months ago to the attacks which Father Lépicier, Professor of Sacred Theology at the Propaganda College, in

Rome, made, in *Analecta*, an official Latin journal representing the Vatican, against certain theological statements of Dr. Hanna, of Rochester. A writer in the September *Contemporary Review* says that Dr. Hanna's name was rejected at Rome for Coadjutor Archbishop of San Francisco on the report of this same Lépicier. Dr. Hanna's respect for Father Lépicier's authority, whether as a theologian or a moralist, was probably not increased when he read his critic's book, "The Stability and Progress of Dogma," published last year, a book written for the use of students, and found several passages like the following:

"If any one makes public profession of heresy, or tries to prevent others by word or by example, he ought not merely, absolutely speaking, to be excommunicated, but he may also be justly killed, lest his contagious and dangerous example should cause loss to others. In fact, a wicked man, says Aristotle, is worse than a beast and does more harm, from which it follows that if it is not wrong to kill a beast of the forest, especially if it be mischievous, so it may be a good action to deprive a heretic man of the power of carrying on a mischievous life, as an injurer of the divine truth and an enemy of the health of other men."

And more to the same effect in resounding Latin, telling us that if warning and excommunication are ineffective, "*ecclesia remittit hominem hereticum judicio seculari, a mundo per mortem exterminandum.*" This in the twentieth century!

✱

If Japanese immigrants are allowed to become American citizens they will do so, if we can judge from the experience of Kona, the Hawaiian island presided over by the volcano, Mauna Loa. It is the one island in which small farms prevail, and some 500 Japanese have separate homes. They are sturdy, industrious little men, and they mean to stay, and they expect their children to be Americans, and they do not wish them to be sent to Japan for education. Already there are ten voting Japanese, and in ten years they will be more than ten times as many. The children go to the public schools and the teachers say they stand at the head of the poll for intelligence. They want their children not to forget the Japanese tongue while learning English, and they have a Japanese school, but they will not allow it to be

Buddhist, but make it non-sectarian, like the public school.

It will be harder to find any of the possessions of the United States more lavishly supplied with liquid refreshments than are the coasts of Alaska. Alaska is divided into three judicial districts. In the first, according to the Government reports of 1907, there are 26 saloons for every 346 white inhabitants, which might seem bad enough, but the second is worse, with one for every 151 inhabitants; and worst of all is the third district, which has 306 saloons for 11,000 inhabitants, or one for every 36, which perhaps beats the record. The judge who had the authority to grant or refuse these licenses was James Wickersham, who is now the Delegate in Congress for Alaska. The saloons remember their friends.

There are places in this country where the right to strike and refuse to work does not hold, and such a place is Talbotton, Ga. We take the report as the press gives it. A negro preacher "told the negroes not to work for white folks at all." That is, he did not like the labor conditions, and told them to work their own land for themselves. Therefore a number of white men went to whip the preacher and drive him out of town. They found him at the house of a negro who defended him, and shot one of the mob. That was resented, and a second mob killed the minister's defender, and later got the minister and lynched him. That is an efficient way to put down a strike.

The brewers and bottlers of Evansville, Ind., have got the right view of things when they understand that the main service of the militia is police duty and not war. They refuse to march in a procession with the National Guard, because in case of violence connected with a strike the militia would be called out to preserve order. This is hardly consistent, for the unions all tell us that they are utterly opposed to violence, and in case of violence by a sympathetic rough element they ought to welcome the aid of the militia to preserve peace.

With an overwhelming majority in the House of Commons Premier Asquith came very near defeat on that one provision of his budget which increases the tax on distilled liquors. The Irish members deserted and went over to the opposition, on the ground that to increase the tax on whisky would put a burden on the Irish. That desertion was poor politics and no real service to Ireland. If whisky could be taxed out of the Green Island it would be to its prosperity and wealth. With us whisky is very heavily taxed.

We occasionally hear reasonable criticisms of the marriage, baptism and burial services in the Episcopal Prayer Book, but seldom anything as sharp as what Dr. Osborn, rector of the old and strong Trinity Episcopal Church, in Newark, N. J., says of another service, in an ordination sermon:

"Be very careful in your use of the office for the visitation of the sick in the Prayer Book. Employ an experienced edition for as it stands it was evidently drawn up in the interest of the undertaker rather than the invalid."

There is no sympathy due to the militant English suffragets who try to advance women's rights by throwing brickbats and breaking windows and screaming to disturb public meetings. They have been treated leniently, but are now being put to hard labor, and when they refuse to eat they are fed with the stomach pump. They deserve no better treatment than is given to male hooligans.

President Taft has preached his first Sunday sermon in the Mormon Tabernacle from a text which we judge is a favorite one with him, "A soft answer turneth away wrath," but which was less esteemed by his predecessor, who was also more of a preacher. It was a good sermon, and not as long as some of President Roosevelt's.

Can this be? A Chinese near San Francisco has constructed a wireless telegraph and an aeroplane that flies, and he will soon take his invention to China. So the yellow man is even in the race.

Enthusiasm Necessary for the Life Insurance Agent

ASK any one if life insurance is a good thing and see what the answer is. No one ever says it is bad. And yet, altho life insurance is admittedly good and every man wants it, sooner or later, it is one of the hardest things to sell. Procrastination in the matter of taking out a policy is all but universal. To sell life insurance requires tact on the part of the agent. It requires knowledge also; knowledge of men and things. The agent who started out to try and sell life insurance and who could not intelligently explain to a prospect the difference between an ordinary life insurance policy and an endowment policy would probably not be able to report much progress day by day. But a man may be well fortified with facts and details and still not be able to sell life insurance. Supposing an insurance agent should ask a prospect the question, "Do you want some insurance?" and the prospect should answer "No." What would anybody think of an agent who would take no for his answer and go away satisfied? The agent who becomes a member of the \$100,000 club works with facts, figures and details, but he has something else in reserve that counts for more than any or all of these. Enthusiasm is his trump card. He believes in life insurance himself and its beneficence. He believes in himself and his work, and by means of his enthusiasm he impresses his prospect with his own viewpoints and paves the way for the needful application on the dotted line.

If the insurance salesman were to wait until his prospect was ready to talk about insurance, both he and the prospect might be dead in the interim, but with enthusiasm the solicitor takes the prospect's thoughts away from all that is distracting, and with enthusiasm, enthusiasm is kindled as a fire, and insurance comes like the gentle dew of heaven, blessing not only him that gives as well

as him that receives, but also the receiver's family when death overtakes him. No argument is needful nowadays to establish the fact that life insurance ought to be carried. Enthusiasm is needed, however, to point the way and to set the time for taking out the policy under which the insurance is to be paid. Enthusiasm inspires work. It makes a man strive after a goal, like the inspiration that comes to the tired soldier thru the agency of the military band. Enthusiasm, when properly directed, draws the prospect and the agent closely together, so that there is a meeting of minds and the needful co-operation, the end of which is symbolized and cemented by the binding policy. Enthusiasm makes light work. It sustains the agent when he fails, as the best one must at times, and it opens doors that would be closed but for it. Enthusiasm strikes out into new and untried fields full of confidence in the outcome. When the enthusiastic man comes home his wife and his children are glad to see him, where they would not be glad to see a discouraged and a despairing man. Business relations, domestic relations, and all other relations are gilded with a finer gold by means of enthusiasm, so that it behooves the insurance agent to seize fast hold of enthusiasm and to let her not go. If he does this, his will be a continual march of triumph and progress. Taking enthusiasm for his watchword he overcomes failure; therefore, be enthusiastic.

STEPS are now being taken looking toward the organization of a new accident company in Omaha. If successful the new company proposes to insure against accident for life upon the payment of a single premium. The amount of this premium is to be based upon the insurer's expectancy and occupation. The idea that there is nothing new in the insurance field does not seem to be well founded.

The Condition of Business

REPORTS concerning general trade are favorable. Prices are firm, and increase of the cost of raw material in several industries points to higher rates for finished products. The corn crop is believed to be out of danger. The hurricane of last week in a part of the cotton belt, causing considerable injury to the cotton crop, has stimulated speculation in this staple, with a sharp rise of prices. Railroad earnings continue to show gains. For the first seven months of the year the increase of gross earnings (about \$137,000,000) was 11.3 per cent. During the same months the increase of net, which is more interesting to the stockholder, was \$77,000,000, or 22 per cent. Within the last few days wages have been increased at the Borden cotton mills, in Fall River, and at the works of the Thomas Iron Company, in Pennsylvania.

In the iron and steel industry there is great activity, with rising prices, notably at the base of production. It is asserted that the pig iron output now exceeds the record figures of 1907, and that this season's shipments of lake ore will be even greater than those of that year. The entire capacity of the leading manufacturers of steel is now in use. This is an increase of 30 or 40 per cent. since the beginning of the year. President Corey, of the Steel Corporation, says in a published interview:

"We are right now in the midst of the greatest development in the history of the steel and iron business. Substantially all of our plants are now running and on practically full time and there is no branch of the steel industry that is backward. The Tennessee Coal, Iron & Railroad Company has rail orders ahead to run for four or five months, and the Carnegie and Illinois companies can make no promises under sixty days. There is a good demand for all grades of finished steel. Next year will witness a record-breaking production of steel in every line. One of the greatest increases will be in railroad supplies, rails and cars. Next year will be the greatest in railroad buying and building ever known in the history of the country. The railroads are awakening to a realization of the situation and are now jumping in with orders. The railway demands for next year will be simply enormous. A new

era of activity is on. It will vastly exceed anything ever before known."

Fisk & Robinson, the well-known bankers, in a recent bulletin, presented an instructive group of statistics showing the return to normal business conditions. For the fiscal year 1909, bank clearings outside of New York were almost exactly equal to those of 1907. Circulation and national bank deposits were much larger than in that year, which furnished a high record in many fields of financial and industrial activity. Building contracts, which were \$655,000,000 in 1907, and which declined to \$550,000,000 in 1908, rose to \$765,000,000 in the year ending with June last. In building operations, as in the iron and steel industry, the proof of recovery has been most convincing. Since the end of June there has been no reaction, but, on the contrary, a steady advance in those industries which are barometers of trade.

....The leading watch manufacturers of the country have increased the price of watches and cases by about 7 per cent., owing, it is said, to the high price of materials. An advance has also been made by the manufacturers of rubber shoes, on account of the continuing high price of raw rubber.

....The President of Brazil, in a recent message to Congress, directed attention to the fact that more than \$100,000,000 worth of iron and steel had been imported in the last three years, and asked for authority to promote the establishment and maintenance of furnaces and steel mills at home, speaking of very large deposits of iron ore in Brazil that might thus be used.

....On the Virginian Railway (built by the late H. H. Rogers) a train of 90 cars, carrying 4,500 tons of coal, was recently hauled by one locomotive from Roanoke to Norfolk, 243 miles. There have since been added to the road's rolling stock two mammoth locomotives, each capable of pulling a train of 152 loaded cars. Such a train would be more than a mile long.

Survey of the World

Mr. Taft on
Conservation of Resources

From Salt
Lake City
the President

went to Butte, Mon., where, wearing a linen duster and an old slouch hat, he went down 1,200 feet in the shaft of the Leonard copper mine. He also inspected the smelting works at Anaconda, attended the State Fair at Helena, laid the cornerstone of a building on the grounds of the Catholic University, and reviewed parades of school children. Arriving at Spokane on the 28th ult., he made a long address there upon the conservation of natural resources. He had reserved this address for Spokane partly for the reason that at the sessions of the Irrigation Congress in that city what is called the Pinchot-Ballinger controversy about water-power sites had been brought to the attention of the public. In the address he commended both Secretary Ballinger and Chief Forester Pinchot. "We like Taft," said Governor Hay, introducing the President at a luncheon party, "because Roosevelt liked him." The President responded:

"Your Governor said you trusted Roosevelt, and that because Roosevelt trusted me you trust me. I am glad to accept this method of winning your approval. As to Secretary Ballinger, I want to thank the State of Washington for giving me such a competent official. I am glad I have come out among those who know him to testify as to his efficiency and integrity."

At the beginning of the address upon conservation of natural resources he urged the States to take measures for the defense of the forests against fire and for the adoption of the best methods of forestry with respect to the timberland

owned by private persons. He pointed out that the timber on the 167,000,000 acres of the national forests was protected against fire and had the benefit of the best modern methods of forestry under the supervision of Mr. Pinchot; that four times as much timberland was owned by private persons; that only 3 per cent. of this was under proper regulations, and that the cost of forest fires was \$50,000,000 a year:

"The wonderful progress made by Mr. Pinchot, with the earnest support of Mr. Roosevelt and Secretary Wilson, at times has met the denunciation of persons in this Western country on the ground that property was being taken which Congress intended for individuals and was being withheld from them. But I think general opposition to Mr. Pinchot's plans has disappeared and that the great body of the American people recognizes the benefit of the reform in reference to forestry, and greatly regrets that it was not begun years before. Congress has come fully to recognize the necessity of pursuing forestry reform by making liberal appropriations for the purpose. The forest lands of the United States ought to be surveyed and carefully preserved, and the jurisdiction of Congress in respect to them clearly defined."

The work of reclaiming arid and semi-arid lands had been carried on rapidly by the Reclamation Bureau. All of the thirty projects in hand were to be commended, but the enthusiasm of the projectors had carried them to a point where they began to be embarrassed for lack of funds (supplied by sale of public lands), and there was need of relief. He thought it wise to ask Congress for it and to urge the passage of an enabling act permitting the Secretary of the Interior to issue \$10,000,000 or more of bonds for the completion of the projects,

the bonds to be redeemed from the money hereafter paid into the reclamation funds. There should be an authoritative classification of the mineral and the agricultural lands in the public domain. Turning to the subject of water-power sites, he said that "special provision should be made in the interest of the public for their transfer to private control." His statement of the terms upon which transfer should be made was one of the most important parts of the address. He said:

"The development of electrical appliances and the transfer of power thru electric lines for long distances has made the use of water power to produce electricity one of the most important sources of power that we have in this country, and will so affect the cost of production in all the fields of manufacture and production of the necessities of life as to require the Government to retain control over the use by private capital of such power when it can only be exercised upon sites which belong to the Government. Such sites can be properly parted with under conditions of tenure, use and compensation consistent on the one hand with reasonable profit to the private capital invested and on the other with the right of the public to secure the furnishing of such power at reasonable rates to every one.

"There should be a condition of forfeiture if the owner of the power site does not within a certain time expend capital sufficient to develop the power or after development shall charge rates to the public beyond what is a reasonable profit on the capital invested in the improvement, to be regulated by the Government. The amount of compensation that ought to be charged by the Government for the use of the water power sites might perhaps be left to readjustment every ten or fifteen or twenty years.

"The compensation to be charged in the outset might well be purely nominal, but after the project has become a complete success and the profit has grown to a considerable percentage of the amount invested, then there would seem to be no reason why the public might not be benefited by sharing in the profits of the transaction to an amount to be fixed upon by arbitration or in some other method at the end of a stated period of fifteen or twenty years.

"This is an arrangement toward which the tenure of all public utilities is tending, and I know of no reason why it should not be introduced into the governmental disposition of such sources of continuous power as the water sites upon public lands are likely to be. I know it has been the course in the past under the bounteous and generous disposition of the Government to give those water sites away under existing inadequate acts, but we have reached a time now when the importance of these water power sites has greatly increased and there would seem to be no reason why it

should interfere with a speedy development of the country to impose upon the use of such water sites restrictions equitable to both the public and the investor. This is a matter which Congress must take up. I shall therefore urge upon Congress at its next session the passage of a law authorizing the disposition of such water power sites upon terms to be agreed upon by the Secretary of the Interior with the proposed purchaser of the character already indicated."

He thought such restrictions would not prevent the investment of capital, but would secure the development of a power for manufacturing industries that would "probably in time exceed the utility and value of coal and become a substitute for it." The Secretary of the Interior, he explained, could not now impose these restrictions or conditions, and the water-power sites now withdrawn from entry were only temporarily withheld from settlement with the expectation that the action would be justified by legislation. As to coal lands in the public domain, either the right to take coal from them should be leased "at a specified compensation per ton," or the coal deposits should be sold outright. "But in every case restriction by forfeiture ought to be included to prevent monopoly of ownership." There should be a similar disposition of the phosphate lands in Wyoming and Idaho. These, with California's oil lands and practically all of the coal lands, had been withdrawn from settlement to await action by Congress. Alaska's coal deposits were so great that when developed they would doubtless furnish coal to the entire Pacific Coast:

"There has been a good deal of discussion in the newspapers as to the attitude of the present Administration toward the general policy of the conservation of resources, and some very unfair and altogether unfounded inferences have been drawn. The truth is that my Administration is pledged to follow out the policies of Mr. Roosevelt in this regard, and while that pledge does not involve me in any obligation to carry them out unless Congress gives full authority to do so, it does require that I take every step and exert every legitimate influence upon Congress to enact legislation which shall best subserve the purposes indicated."

Secretary Ballinger, he added, was in entire accord with him, and in his reports as Commissioner of the Land Office had urged the adoption of a Federal policy along these lines.

Ship Subsidies and Alaska

The President arrived in Seattle on the 29th ult., and on the following day, in the great amphitheater of the Exposition, he made an address concerning ship subsidies and the government of Alaska. China was waking up, he said, and Japan was moving forward with giant steps in commercial competition. In the next half century commercial progress would be seen more decidedly in the Pacific than any where else, and we should "repair a condition in respect to our merchant marine that is humiliating to our national pride and most burdensome to us in competition with other nations in obtaining international trade":

"We maintain a protective tariff to encourage our manufacturing, farming and mining industries at home and within our jurisdiction, but when we enter into competition upon the high seas in trade between international ports our jurisdiction to control that trade so far as the vessels of other nations are concerned, of course, ceases, and the question which we have to meet is how with the greater wages that we pay, with the more stringent laws that we enact for the protection of our sailors, and with the protective system making a difference in the price between the necessities to be used in the maintenance of a merchant marine, we shall enable that merchant marine to compete with marine of the rest of the world.

"This is not the only question, for it will be found upon an examination of the methods pursued in other countries in respect to their merchant marine that there is now extended by way of subsidies by the various Governments to their respective ships upward of \$35,000,000, and this offers another means by which in the competition the United States ship is driven out of business and finds itself utterly unable to bid against its foreign competitors. Not only this, but so inadequate is the American merchant marine today that in seeking auxiliary ships with which to make our navy capable of offence or defence, or indeed in sending it around the world as a fleet, we have to call on vessels sailing under a foreign flag to carry the coal and to supply the other needs of such a journey."

If compelled to go into a war we might be unable even to buy the needed vessels from foreign countries. By subsidies, European nations had diverted from South American trade which might otherwise have been drawn to our own country. "I need not tell you of the inadequacy of our merchant marine on the Pacific, and of the growing commercial power of the empire of Japan."

It seems to me that there is no subject to which Congress can better devote its attention in the coming session than the passage of a bill which shall encourage our merchant marine in such a way as to establish American lines directly between New York and Eastern ports and South American ports and between our Pacific coasts ports and the Orient, and the Philippines. We earn a profit from our foreign mails of from \$6,000,000 to \$8,000,000 a year. The application of that amount would be quite sufficient to put on a satisfactory basis two or three Oriental lines and several lines from the East to South America. Of course, we are familiar with the argument that this would be contributing to private companies out of the Treasury of the United States, but we are thus contributing in various ways on similar principles in effect by our protective tariff law, by our river and harbor bills and by our reclamation service. We are not putting money in the pockets of ship owners, but we are giving them money with which they can compete for a reasonable profit only with the merchant marine of the world."

He thought the country was ready now to try such a law in a comparatively small way. If it should be successful, experience would show how the policy could best be expanded and "the American flag be made to wave upon the seas as it did before our Civil War."—He believed it would be a great mistake to give Alaska the regular form of territorial government under which a Legislature and a Governor might be elected. The population was not of sufficient stability and permanence of residence. In his judgment, the Territory should be brought under the management of one bureau or Department at Washington, so that its interests might be centered in one responsible bureau chief, whose business it would be to present to Congress, thru the head of his Department, the needs of the Territory, to follow legislation and to attend to everything at the Capital in which the people of the Territory were interested. He suggested that local legislation should be vested in a resident commission of five members, appointed by the President. There was an opportunity, he added, for Congress to aid in the construction of certain railroads that would largely develop Alaska and which private enterprise would not undertake without some kind of guarantee from the Government. He would unhesitatingly recommend that aid be given, because Alaska was a place in which it could not be expected that pri-

vate capital would build the first railroads. He intended, he said, to visit Alaska next summer.—Speaking at a dinner, on the 30th, the President said that while he was in the Cabinet of Mr. Roosevelt he became imbued with the latter's spirit with reference to "certain policies rightly named his":

"Of course, in attempting to carry out these policies disagreements will occasionally arise as to methods and as to just what the policies are, and as they have a saying among Catholics that there are Catholics who are more Catholic than the Pope, so occasionally we may find gentlemen so earnest in their support of Mr. Roosevelt's policies that they are more Rooseveltian than Mr. Roosevelt himself; and with respect to these gentlemen all I have to say is that I am doing the best I can to carry out the policies as I understood them, and I had during four years at least a somewhat favorable opportunity to learn what they were."

Politics in New York City

The tickets for the approaching municipal election in New York have been completed. William J. Gaynor, of Brooklyn, a Justice of the Supreme Court of the State, has been nominated for Mayor by the organization (Tammany) Democrats, and the nomination of Otto T. Bannard by the Republicans has been approved by nearly all of the organizations which originally united in a fusion movement against the Tammany forces. Judge Gaynor, now fifty-eight years old, has been a prominent advocate of political reform, and was a leader some years ago of the movement against ring rule in Brooklyn. It was due to his efforts that, in 1893, John Y. McKane, the political boss of the Coney Island district, was sent to the penitentiary. Mr. Bannard, fifty-five years old, a graduate of Yale, is the president of the New York Trust Company and for years has given much time and labor to the promotion of organizations for the relief of the poor. President Taft writes that a friendship of thirty years enables him to testify to Mr. Bannard's disinterested patriotism, great administrative ability, broad-minded common sense and high ideals. The leading issue, except the general one of extravagance and the alleged maladministration of the Tammany government, relates to the construction of additional subways. The two platform utterances on this subject are as follows:

Republican and Fusion: All future subways should be owned by the city. They should be built with the city's funds, construction by private capital not being permitted except when it is positively demonstrated that the city is financially unable to keep up with the demands for transit extension, and then only on terms that will preserve strict and effective municipal control.

Democratic: We are in favor of the building of the subways necessary to relieve the present congestion of travel. We are in favor of the building of the subways by the city itself and of the complete separation of such building or of any contract therefor from the leasing of subways for operation after completion. We declare, from experience, that no necessary subway will be a source of expense to the city and cause any increase in the rate of taxation; on the contrary, the increase of taxable value of such a subway will yield in taxes more than the cost of construction and interest thereon. If it be found necessary to permit any subway to be built by private capital, it should be done on the basis of a lease of the subway for the lowest term of years to the builder in return therefor.

The Democratic platform also calls for "municipal ownership and control of public franchises and utilities." At the end of last week Congressman Herbert Parsons, president of the New York County Republican Committee, and a leading supporter of Mr. Bannard, published the following statement:

"In the last session of the Legislature we sought legislation to perfect the signature law. It was defeated thru a combination of Tammany men and some up-State Republicans. We discovered that it was part of the deal entered into to get support for Speaker Cannon and the rules in the House of Representatives from Tammany. No information of this deal was given to the Republicans from New York City. *Entered at Washington — Albany.*"

He added that Tammany now, benefiting from the defeat of the movement to amend the law concerning signatures in registration, was preparing for frauds on a large scale. The charge relating to action at Washington has excited discussion. Seven New York Democrats, led by Mr. Fitzgerald, voted for the House rules, and the Speaker afterward made Mr. Fitzgerald a member of the Rules Committee.

The Cuban Congress adjourned on the 1st, having been in session eight days. For public works in the district where much loss was caused by the recent hurricane, \$100,000 was appropriated. It is understood that President Gomez op-

THE MILITARY PARADE

Squadron A entering the Court of Honor on Fifth avenue near Forty-second street.

posed the appropriation of a larger sum. —When the schools in Porto Rico were opened last week, it appeared that the number of American teachers had been reduced from 160 to 100. Sixty had withdrawn from the service owing to a reduction of salaries by the Government. —The termination on November 1 of the reciprocal tariff agreement with France (due to our new tariff law) will injuriously affect the Porto Rican coffee trade, because a higher duty will be imposed by France upon coffee from the island. It is expected, however, that eventually the old duty will be restored.

—At the second trial, in Hawaii, of the ten Japanese indicted for rioting during the recent strike, the jury disagreed, standing 11 for conviction and 1 for acquittal. As the law does not permit a third trial, this is the end of the case. At the first trial there were 7 jurors for conviction and 5 for acquittal.

Countries South of Us

The Colombian Congress is in session, considering the tripartite treaty relating to the independence of Panama. It is expected that the treaty will be rejected. —Arrangements have been completed for the submission to the Hague tribunal of the claim of the Orinoco Shipping Company (a New Jersey corporation) against Venezuela. This is a claim for \$1,400,000. It has once been the subject of arbitration, but the award, \$28,000, was unsatisfactory to the claimant, and it is alleged that serious errors were made. —In the new agreement between Bolivia and Peru, Bolivia accepts the decision of the President of Argentina concerning the territory in dispute, and an allotment of the lands is made in accordance with that decision. —Panama has recalled her Ministers at London, Paris and Lima, and has discontinued all consulates where the fees do not pay the expenses. Much money has been saved by this reduction of the diplomatic and consular service. —At Indianapolis, on the 20th ult., Judge Anderson, of the United States District Court, denied the application of the Government for further postponement of the hearing in the case against Delavan Smith and Charles R. Williams, owners of the Indianapolis

News, who were indicted for criminal libel because of the publication of articles charging corruption in the purchase of the Panama Canal property. The pending question is whether they shall be removed to Washington for trial. The Government sought delay because the similar case against the New York *World* is set for trial on the 20th. The hearing in Indianapolis will be resumed on the 11th. This is the case in which the indictments assert that Mr. Roosevelt, President Taft's brother and other well-known men were injured by the published articles.

British Politics The Post Office Department has taken over all the coast stations of the Marconi wireless telegraph, with the exception of the long distance stations at Poldhu, Cornwall and Clifden, Ireland, used in the transatlantic service. The Marconi Company receives \$75,000 in return for all its land, apparatus and rights. The wireless stations maintained by the Lloyds are also acquired by the Post Office. The Government came to the conclusion that it must control communication with ships from both strategic and commercial considerations, that it was necessary for the defense of the islands and formed an essential part of the Government, postal and telegraph system. Postmaster General Buxton anticipates that the incorporation of the wireless system will result in a great extension of its use. Since wireless stations can be erected at very much less cost than cables can be laid, it is likely to supersede the cable system to a great extent in the future. —The suffraget prisoners at Birmingham, who were saved from starving themselves by forced feeding thru a stomach pump, are to bring action against the Government for cruelty and invasion of personal rights. Writs have been issued against the Home Secretary, Mr. Gladstone, and the prison officials at Birmingham. Keir Hardie brought the matter up in the House of Commons, and denounced the acts of the officials as horrible barbarism. Mr. Masterman, the parliamentary secretary of the Local Government Board, in Mr. Gladstone's absence, explained that he

sanctioned the use of forcible methods because it was the duty of those in charge of the prisoners to prevent them from committing the felony of suicide. It was the ordinary treatment, he said, applied to contumacious and weak-minded persons who refuse food.—The majority of the London bankers have petitioned the House of Lords to reject the budget on the ground that it would “not only destroy confidence and credit, but hamper commerce and industry and diminish employment.” Both parties are endeavoring to secure the aid of King Edward, but it is thought that he will refuse to take part in the controversy, altho he is said to be opposed to the rejection of the bills by the Lords, believing this to be unconstitutional and revolutionary action. It seems to be now the prevailing opinion that the House of Lords will pass the Finance Bill, but even in that case, that the Government will shortly appeal to the people.

Aviation A novel and somewhat sensational flight was made by M. Latham at Berlin last week. He flew over the city from Tempelhofer Field to Johannisthal, a distance of about 12 miles. His average elevation was about 400 feet, and he is reported to have reached a speed of 74 miles an hour. Otherwise the aviation meet of Johannisthal was not marked by any striking advances in the conquest of the air. Most of the flights were of a kind that we have come to consider ordinary, and several of the competitors failed to accomplish anything. The long-distance prize of \$10,000 was won by M. Rougier, for a flight of 74 miles, and the same aviator took the prize for altitude with a record of 560 feet. Farnam and Latham took second and third places in several of the contests. Orville Wright did not compete, but carried on his own experiments independently at Potsdam, near Berlin. Here he made a higher flight than has ever been accomplished before, reaching an altitude estimated to be 1,600 feet, altho no official measurement was taken. He was fifteen minutes in rising, but dropped to the ground in five. Crown Prince Frederick Wilhelm insisted upon being taken as a passenger in

One of his flights and circled the field at a height of 60 feet.—Our American champions, Wilbur Wright and Glenn H. Curtiss, were engaged for the Hudson-Fulton celebration and have been all the week on Governor's Island waiting for calmer weather. Mr. Curtiss has so far not made any flights, but Mr. Wright, on October 4, flew up the Hudson and around the battleships opposite Grant's Tomb and back, making the distance of about 18 miles in 33½ minutes.

A Spanish Victory Reversed

The people of Spain were excited to wild enthusiasm by the announcement that the troops under General Marina had occupied the summit of Mount Gurugu, the stronghold of the Moors. It was expected that this would be the conclusion of the war, and, in fact, Premier Maura is reported to have stated as much. Spanish warships on both coasts fired salutes and the cities were decorated and illuminated. Crowds filled the streets of Madrid and assembled before the royal palace, cheering the King. Even the republican papers congratulated the Government on the conclusion of this unpopular war and discussed the amount of territorial indemnity to be demanded of Morocco. General Marina received royal congratulations on his successful strategy, and it was reported that the Riffians were surrendering by the thousand. The next day, however, it appeared that they had again employed the Fabian tactics which they had often used before in this campaign. In their desultory style of warfare the occupation of a particular point or the destruction of a village is not regarded as important. Undeterred by the capture of Zeluan and Nador by a column which General Marina dispatched to the southward of Melilla, they countermarched to the north behind the hills and assembled in large numbers back of Mount Gurugu. The brigade of Spanish troops under General del Real was allowed to march from Melilla to the top of Mount Gurugu early in the morning without opposition. The Spanish flag was raised on the summit and cheered by the troops, but in a short time they were attacked by the Moors and forced to relinquish

the position. On the following day a Spanish column at Zeluan was ambushed and severely punished. A column composed of six battalions of chasseurs, three batteries of mountain artillery, one Schneider battery and three squadrons of cavalry was sent out from Zeluan to reconnoiter the position of the enemy. The Moors retired at first, but when the Spanish troops had entered the rocky defile, their cavalry was useless as they were attacked from the heights on both sides. Two hundred and thirty-five men are reported killed and wounded. One battalion of chasseurs alone lost 19 officers and 180 men. Gen. Diaz Vicario, who was supporting the movement, came to the rescue with his brigade and was himself killed, together with three other officers. These reverses, following so closely the announcement of the successful conclusion of the war, have produced a strong reaction in popular feeling in Spain, and both the Government and military officers are discredited. Still, there is no likelihood that the campaign will be abandoned, and reinforcements of 15,000 men are to be sent immediately. This will bring General Marina's forces up to about 75,000 and should enable him to crush the native troops opposing him. In how far they are supported by the authority of the Sultan cannot now be determined. Envoys of the Sultan are now in New York, and said to be trying to induce our Government to come to the defense of Morocco, in consideration of the cession of a port on the Atlantic Coast. The refusal of our Government to intervene has greatly pleased the Spaniards, who feared that America would join with Germany in opposing the Spanish plans. Spain is expected to demand an indemnity of \$20,000,000 from Morocco, and the occupation of additional territory in the neighborhood of Melilla.

Foreign Notes

The French bishops have declared war against the public schools, forbidding parents to send their children to them and threatening them with excommunication if they do. The pastoral letter condemns co-education as "contrary to morality and unworthy of a civilized people." The whole city of Adria, Italy, has been ex-

communicated as a punishment for the recent anti-clerical demonstration, during which Bishop Boggiani was stoned and severely injured.—The great Swedish strike is not so near settlement as was hoped. The Government, which undertook to arbitrate the dispute, at the request of both parties, has not been able to bring them to an agreement, and 60,000 men are still out. The question of compulsory arbitration of future disputes is the point on which the negotiations have been checked.—The dock laborers of Havre, to the number of 1,500, have struck for higher wages, and the loading of ships is carried on with considerable difficulty and danger.—The Finnish Senate has refused to contribute the \$4,000,000 which the Russian Government has assigned to the Grand Duchy as its share of the burden of taxation for the defense of the empire. The senators declared that \$2,000,000 a year is all that Finland ought to be called upon to pay, and that if a larger assignment were made the entire Senate would resign office except the judicial department.—The ex-Shah of Persia, Mohammed Ali Mirza, has crossed the Caspian to Russia, where he will live in exile. General Snarski, who invaded Persia from the frontier a few months ago and occupied Tabriz with a Russian force in order to put a stop to the conflict between the constitutionalists and royalists, will soon return to Russia, leaving in Tabriz a garrison of four companies of infantry and Cossacks, with four machine guns. The constitutionalists seem to be at least as successful in maintaining order and good government in Persia as the absolutism which they overthrew.—The British Government is likely to find it necessary to blockade the Persian Gulf to prevent the clandestine importation of arms into Afghanistan. The Waziri tribesmen, who not long ago raided the frontier of Northwestern India, are again manifesting a belligerent disposition and trouble is expected. The brother of the Amir, Mazrullah Khan, is at Kabul, endeavoring to rouse the tribes of the frontier to unite in a holy war against the English. In case of an outbreak the British troops would probably proceed to Kabul, which the agreement with Russia will now permit them to do.

GREAT AMERICAN UNIVERSITIES—X.

CORNELL UNIVERSITY

by EDWINE E. SLOSSON

THE University of Illinois and Cornell University are of the same age and the same size. Both are offspring of the Morrill Act, and their main strength has, consequently, been in engineering and agriculture. Nevertheless, they are about as unlike in general character as any two universities.

The contrast begins with their looks and location. The Labrador ice sheet which planed Illinois furrowed New York. Looking at the map of the State one would think that some primeval giant had tried to climb up the world to get at the North Pole and had dug his ten finger nails into the rock. The supposition would not be far wrong except that the giant was bigger and more inhuman than any the myth-makers could imagine. Two of these north and south scratches, or Finger Lakes, were dug deeper than the level of the sea, and at the foot of one of them, "far above Cayuga's waters," is Cornell University,

perched upon the terraces of the terminal moraine that dams the lake.* Two other universities alone can compete with it for beauty of situation—California, which overlooks the Golden Gate, and Wisconsin, which also has an extensive lake view. But Ithaca is unrivaled in the number of glens, gorges, waterfalls and what-nots within easy walks, rides and sails. Two beautiful streams, Cascadilla and Fall creeks, bound the campus on either side. Along one of these deep wooded ravines winds Goldwin Smith Walk, and a bridge across the other affords a fine view of Ithaca Falls, 165 feet high. I have heard the cultural value of the Cornell scenery estimated as equivalent to five full professors. Not knowing in what thermodynamic units professor power is measured, I was not able to verify this estimate. It was, however, the horse

*For an account of the glaciation and scenery of this region see O. D. von Engel's "At Cornell" Artil Press, Ithaca, 1909.

power of the falls rather than their esthetic value which fixed the University upon this site. Here young Ezra Cornell first showed his engineering skill in 1831 by running a water tunnel thru the soft sandstone and later by damming Fall creek made Beebe lake, which gives light and power to the campus and city. With this he ran his mills and laid the foundation of his fortune, which became the fortune of the University. Here he established his stock farm, which became the campus of the University. So did Senator Stanford at Palo Alto. The two men were much alike in character and career. Both were financial pioneers. They made their money by their faith in new things, in projects that others rejected and lands that others despised. The two universities they founded are much alike also, and would have been still more so if the educational ideals and purposes of the founders had been more closely followed out. Institutions do not seem to take after their parents as a rule.

In 1843 few people took stock in the alleged invention of a magneto telegraph by S. F. B. Morse. As the inventor was a college professor and, even worse, a sculptor, his machine could not be expected to work well, and it did not. But Mr. Cornell, being out of a job at the time and therefore open-minded, took up Professor Morse's scheme and invented a plow to lay the wires underground. The experiment was a failure, being an anachronism. For the next half century telegraph wires were to be strung on poles, so Mr. Cornell invented a method of stringing them on poles, all the way from Washington to Baltimore, and, to make a long story short, he was able some twenty years later, to back his endowment of the university with \$500,000 of Western Union bonds, a good paying proposition.

He also dabbled in politics with considerable success. He was in the State Senate, chairman of the Committee on Agriculture when Andrew D. White was chairman of the Committee on Education, and it was the syzygy of these two men, the conjunction of these two ideas, that produced Cornell University. Education and agriculture had walked far apart since the days when the earth

was young. Pagan, peasant, yokel, bumpkin, rustic, all the old names for countryman imply illiteracy and lack of culture. It was the object of the Morrill Act to change all this.

In previous articles I have told how the land scrip endowment of the Morrill Act in other States was largely wasted thru carelessness, fraud, necessity or lack of foresight. But in New York the case is different, owing to the speculative genius of the founder. He bought the scrip when nobody else would take it, at thirty cents an acre, and located it in Wisconsin timber and Kansas farms, returning part of the money doubled or trebled before he died and leaving an investment which has so far brought to the university about five million dollars. But the university was for many years in the condition known to the early settlers in those States as "land poor." In 1881 it had fewer students than when it started; its buildings and equipment were deteriorating; its endowment was reduced; its debt and deficit were piling up.

Cornell is sometimes called a State university of the East. There is undeniably some resemblance to the State universities, but to one who comes to it after making the rounds of them the differences are so much more striking that it does not seem like a State university at all, but rather like Yale, Harvard or Pennsylvania. It has neither the good nor the bad qualities of the State university type. Curiously enough, the agricultural department, which is really a State institution, has distinctly the atmosphere of the State university. In its social life, in its sense of responsibility toward the State as a whole, in its freedom and unconventionality, in the spirit of faculty and student body, something undefinable, but, it seems to me, quite perceptible. But the agricultural college is very different in its character from the university as a whole.

The deviation of Cornell from the State university type is the more remarkable when we consider the start it had in that direction. Both of its presidents during its formative period, Andrew D. White and Charles Kendall Adams, came to it from the mother of State universities, Michigan, and ob-

JACOB GOULD SCHURMAN,
President of Cornell University.

viously took this as a model in several ways. The institution which Mr. Cornell thought he was founding was more like some of the State universities than the Cornell of today. It was his expressed intention that the instruction should be "on such terms as the limited means of the most humble could afford." And, again:

"I hope we have made the beginning of an institution which will prove highly beneficial to the poor young men and the poor young women of our country."

His words, which form the motto on the seal of the university, "I would found an institution where any person can find instruction in any study," do not suit the modern Cornell any more than his style of wearing his beard, and this is the reason why Cornell, like the University of Chicago, is advertising for a new design and motto for the seal. Some of the State universities, with their free tuition, their accommodating entrance requirements, their extension and correspondence courses and the bureaus of universal information, make more of an attempt to live up to Ezra Cornell's impracticable ideal than the institution that bears his name. The State of New York thinks it cannot afford to do what is done by the poorest Western State—that is, offer a free collegiate education to every young man and woman within its borders.

Cornell performs the functions of a State university in giving free tuition to agricultural and veterinary students from New York and to 114 students in other departments nominated by the State Commissioner of Education, one for each assembly district. Other steps have been taken under the administration of President Schurman to make a closer connection between the State and the university. The last Legislature, for example, increased the public control by having five of the trustees appointed by the Governor, instead of being elected by the board. Other representatives of the public having ex-officio positions on the board are the Governor, Lieutenant-Governor, Speaker of the Assembly, the State Commissioner of Education, the Commissioner of Agriculture, the president of the State Agricultural Society, and a trustee elected by the State Grange. Fifteen trustees,

elected by the board, ten by the alumni, the librarian of the Ithaca Public Library, the president of the university, and the eldest male descendant of Ezra Cornell, make up this curiously composite body, apparently an attempt to get the advantages of all known forms of governmental succession, having hereditary, democratic, scholastic, plutocratic, oligarchic, corporational, appointive and elective members. Such a combination could not fail altogether. For the first time since 1895 there is no woman on the board of trustees.

Since the tendency in some Eastern institutions, in Cornell and Pennsylvania, possibly also Johns Hopkins, is to approximate the State universities in form and function, it will be interesting to observe them in the future to see if they also acquire more of the State university spirit, or whether this spirit is due merely to the fluidic conditions of a primitive and pioneer community and will disappear in the West when society becomes solidified and stratified. Certainly it would be hard for a State university to thrive in the Eastern atmosphere of caste and exclusiveness, of wealth and family pride, of vocational predestination, and of the subordination and segregation of women. I do not mean to imply, of course, that the caste spirit is absent even in the newest and poorest of communities. I lived once in a mining town of five thousand inhabitants. It was only two years old and mostly composed of one-room log houses with tin-can roofs, but the ladies on Ohio street, who had come the year before, refused to call on the ladies of Michigan street, who had been there only six months. In the rawest of Western universities the "barb," even if a six footer, is below the "frat" man's line of sight. Social psychology not being under the laws of arithmetic, there is more difference between \$250 and \$500 a year in student expenses than between \$1,000 and \$2,000.

The most marked inferiority of the State universities has been and still is in graduate work. This may be roughly measured by their output of doctors.* There have been 3,471 doctorates of philosophy and science conferred dur-

*For these statistics see *Science*, August 20, 1909.

ing the past twelve years, and of these only ten per cent. are to be credited to the State universities. The universities considered in these articles have conferred four-fifths of these degrees, the nine endowed institutions 2,634 and the five State institutions 289. Contrary to the general impression the State universities are not so largely devoted to science as the others. The endowed universities gave 46 per cent. of their doctorates for research in physical and natural science, while the State universities gave 40 per cent. in these branches. The contrast in individual cases is more striking. The leading State university in graduate work is Wisconsin, which has 32 per cent. of its doctorates in science, while Cornell, on the other hand, has 60 per cent. in science.

The distribution of graduate students at Cornell is quite unusual. In most places the chemical department is far ahead of the others. More than twice as many men have gained the doctorate in chemistry than in any other subject.*

The chief reasons for this are that chemists have more opportunities for employment outside of educational work and that there is a better chance for successful research. It is known that in chemistry there are just as good fish in the sea as ever were caught. A man can throw in his line almost anywhere and hook an *Arbeit*, at least a little one, which with ordinary care and luck may be landed. Other departments, particularly the humanistic, cannot give promise of such sure reward for industry.

*The number of doctorates conferred in the leading sciences for the last twelve years is: Chemistry, 413; physics, 202; zoology, 100; mathematics, 107; botany, 153.

At Cornell the chemical department has always been a strong one, and was the leader in taking up earnestly the now dominant branch of physical chemistry. But in the number of advanced

students two other departments have now passed it. According to the latest report of the president the leading departments had in 1907-8 the following number of graduate students working for higher degrees:

Agriculture	44
Physics	40
Chemistry	35
Philosophy	29
Political Science	28
Mechanical engineering	21
Zoology	19
Botany	19

That is, Cornell has more graduate students in the single department of agriculture than some universities

have either in their entire graduate schools or in their undergraduate colleges of agriculture. Of more significance than their number is the high quality of the young men now being attracted to agricultural research. This is due, as I have said before, not so much to the practical demands of the industry or to the heavy subsidizing of such work by the Government in the Adams and other experiment station funds, but rather to the new field of discovery which has suddenly been opened in this direction. One of the most interesting doctor's examinations that I attended in my rounds of the universities was one in Cornell on the methods of manufacture of new kinds of fruit. Even an outsider could catch something of the fascination there must be in the modeling of plants and animals according to a preexistent concept. "Frankenstein" and "The Island of Dr. Moreau" employ clumsy and antiquated devices compared with the new tools of the creative biologist of today. Whatever may prove to be the validity of Mendelism as a law it has demonstrated its value as a guide and stimulus

HIGH BRIDGE IN FALL CREEK GORGE.

to research in heredity. Students of ambition and ability seem to seek by a sort of instinct those fields which are to be for their generation the most profitable and those instructors who have a message for the future, often obeying this instinct in opposition to the prevailing college opinion and authority of the official leaders of thought. We see apparent instances of such teleological tropism in reading biographies of famous men and in watching the career of our students in school and after. A special providence seems to watch over the destinies of students, of some students, and guide them safely thru the chaos of the elective system. But this may be a superstition of mine, induced by the feeling that a special providence is more needed in the elective system than elsewhere.

The department of physics at Cornell has an exceptional record for produc-

tivity, both of papers and professors. This is due to the fact that Professor Nichols, who has been at the head of it for over twenty years, is not only a zealous investigator, but has the rare ability of being able to impart his zeal to others. The new building, the gift of John D. Rockefeller, is worthy of especial attention from other institutions because of its commodious and convenient arrangement. It is not of the hermit-crab style of architecture common in our universities. It was obviously designed from the inside. Professor Nichols apparently had something to say about how it should be constructed, as well as Carrère and Hastings. Its only claim to beauty is, however, that based on the proverb "handsome is that handsome does." Here are handled, I believe, a larger number of students, elementary and advanced, than in any other physical laboratory in America, and yet with an unusual amount of personal attention and opportunity for individual work.

The visitor who climbs to the top story of the old Morrill building will find an interesting department, the psychological laboratory, occupying a desultory series of twenty-six rooms. Philosophy at Cornell is especially favored by having a separate endowment of its own, the gift of the late Henry W. Sage, chairman of the board of trustees from 1875 to 1897. At the time when the school was founded, some twenty years ago, there was a prevalent impression, at least among those of us who were young, enthusiastic and inexperienced, that there was some sort of a philosophical millenium soon to come about, an era of good feeling, when physician and metaphysician should fall on each other's necks; when Platonist and Aristotelian should understand one another's tongue; when psychologist and physiologist should see both sides of the shield; when all should join hands and rally round the kymograph and a little child should lead them. My language is a little confused, but all the better represents our state of mind at that time. It seems long ago when I think of it, for the millenium has been indefinitely postponed, as all milleniums have to be, and probably the vision that

THE NUMBER OF STUDENTS IN CORNELL UNIVERSITY, 1885-1905

THE NUMBER OF STUDENTS IN THE DIFFERENT DEPARTMENTS OF CORNELL UNIVERSITY, 1888-1908.

inspired us has faded from the sight of the younger generation. Anyway, there seems to be at Cornell no such concentration of forces on the problem of the mind as we once hoped for. The de-

DISTRIBUTION OF STUDENTS AT CORNELL UNIVERSITY, 1908-9.

the *American Journal of Psychology*, but over in Goldwin Smith Hall, Plato and Kant and Thomas Aquinas pursue the even tenor of their way undisturbed by this machinery. Professor Burt G. Wilder has a unique collection of 1,600 brains in McGraw Hall, but what have they to do with the living brains of the children that are being experimented upon in the educational department? I do not mean to find fault with Cornell for failing to do what is done nowhere, but I merely note the fact that even the centripetal force of a special endowment has not succeeded in founding a school of philosophy, in the traditional sense of the term; it has merely brought to one place a number of philosophical students.

Cornell has the commendable custom of printing in the president's report a list of the articles published by the faculty during the year. The bibliography for 1907-8 includes the names of 183 authors, about a third of the faculty, which would rank Cornell in this respect somewhere between Yale and California. The publications seem to be all of a scholastic, none of a belletristic, character, and I should judge from the titles that about 128 men were more or less actively engaged in research, four-fifths of them in the natural and physical sciences.

Notwithstanding the preponderance of scientific students at Cornell, greater

partments have all grown, but not grown together. They are scattered topographically and logically. Professor Titchener's machines spin freely in Morrill Hall, grinding out papers for

than in any other of these universities, the true university spirit has shown in the preservation of the balance of power. The minor departments have been overshadowed, but not stunted. They have kept their work at as high a grade as the same departments in institutions where they are in the lead. To take an example from the extreme right wing of the faculty, the Greek department last commencement turned out three doctors. This is a small number, but a large proportion, for the total number of Ph. D.'s granted in Greek was only eleven. Now the same year there were thirty-nine doctorates conferred in chemistry in the United States, of which Cornell is credited with six, only Yale, with seven, being above it. That is, Cornell had this year a higher relative standing among the universities of the country in Greek than in chemistry. It must, however, be noted that this was an exceptionally good season for Greek at Cornell.

The literary publications of the university are a series of *Studies in Classical Philology* and *Islandica*, the latter devoted to the exposition of the unique collection of 9,000 volumes on Iceland. Other Cornell periodicals are *The Philosophical Review*, *The Physical Review*, *The Journal of Physical Chemistry*, *The Cornell Civil Engineer*, *The Sibley Journal*, *The Cornell Countryman*, and the publications of the agricultural, medical and veterinary schools.

Those who fear the extinction of "the college" thru the encroachments of the professional schools should study the situation at Cornell, where they will find much of interest and not a little of encouragement. Here, where the technical departments predominate more than elsewhere, humanistic studies, both in their ordinary and in their more recondite forms, have thriven from the beginning. At the present time the College of Arts and Science is growing more rapidly than the technical schools, and for the last few years has been the subject of special consideration by the president and faculty. In some institutions the early demise of the old college seems to be accepted as a foregone conclusion, and the quiet of the deathbed is disturbed by squabbles over its estate.

In Cornell it is recognized that the difficulty with the college of arts is not the strength of its new competitors, but the lack of a clearly defined and generally accepted idea of its own purpose. As Dean Willcox put it: "The most vital need of college education thruout America is the formulation and application of some definition of a liberal education which will apply to the new conditions." The chief tangible results of the prolonged and active discussion of this question at Cornell have been the housing of the humanities in Goldwin Smith Hall and the creation of the Administrative Board in Charge of Freshmen and Sophomores. The intangible results, such as the clarifying of ideas and the development of a spirit of unity and self-consciousness in the college of arts, are doubtless more important.

The new building devoted to the Arts departments has been placed in the center of the campus, and stretches 384 feet north and south. Its architecture has been admired and criticised with equal warmth. It is, at any rate, dignified and imposing in appearance and commodious in arrangement. It was fittingly named for the scholar and statesman who, coming forty years ago, from the oldest of English universities, endowed this new one with something of its ideals of culture and service to the State. On either side of the entrance are long and lofty halls containing a larger collection of casts of Greek and Roman sculpture than any other university possesses. Most of the work in literature, philosophy, education, history and politics is done in this building, which is in direct charge of the dean of the College of Arts and Sciences. Here are numerous seminary, study, office and consultation rooms for students and professors, and a reference library. I might mention here that the habit of home reading by the students has been very greatly increased by the simple expedient of setting apart a room in the library building for a circulating collection of 3,500 volumes on open shelves. Last year each volume of this library was, on the average, drawn twice for home use and read twice in the room.

Placing the Freshmen and Sophomores in charge of what is practically a

special faculty composed of the professors under whom most of their work is done, is a recognition of the fact which President White was the first to discern and President Harper to put into effect, that here is the true line of cleavage in the college. The Cornell committee in initiating this movement stated the point very succinctly as follows:

Among the best of our colleges and universities the great break in the course of a collegiate or liberal education comes at the end of the second year, both as regards the curriculum and the methods of instruction. This differentiation of the work, methods of instruction, and educational aims of the first two years of the course in the College of Arts and Sciences in contrast with those of the later years of that course calls for a corresponding differentiation in the staff of instruction, which could not fail to insure greater thoroughness of instruction, greater simplicity and effectiveness of administration, and closer personal and social intercourse between teachers and students.

How far this idea will be carried I do not know. There is at present strong opposition at Cornell against facilitating the entrance of students with advanced standing, or even granting degrees for less than four years of work in residence. In this, as in several other respects, the policy of Cornell is opposite to that of Columbia.

The efforts of the President have for some time been directed toward having all the technical and professional schools put on the basis of two years or more of collegiate work. The Cornell Medical College in New York City has been made a strictly graduate institution, requiring a college degree covering a minimum of a year's work in each of chemistry, physics and biology. The faculty of law favor the requirement of a year and in the near future of two years of arts work for admission. But the engineering faculties have not been induced to go farther in this direction than to authorize as an alternative to their established four year course, a five year course containing extra work in the humanities, the same expedient as has been adopted in the University of California.

This question of entrance requirements is now one of the most puzzling problems of American education. They have been raised so rapidly of late that it is fair to ask if the optimum limit has

not been reached or even in some institutions surpassed. The universities have always been inclined to take—and waste—too much time. Seven or eight years of a young man's life is a large amount to spend in non-productive labors preparatory to his career. It was doubtless a good plan for Cornell to make its medical school strictly graduate. It does not follow that all other medical schools and the Cornell engineering schools should follow this example or feel ashamed of themselves because they do not. At least it might be well to wait a while to see what sort of men are turned out by the new graduate engineering schools established at Harvard. It cannot be decided on theory alone. Harvard says you cannot make a scholar without four years of collegiate work before the engineering course begins. Cornell retorts that you cannot make an engineer without four years of strictly engineering work.

The engineering authorities at Cornell are rather set in their ways. This is natural, because their ways are good and have been tested by long experience. A degree in engineering from Cornell is as good as gold. It passes current all the world over at the highest rate of exchange. Every effort has been devoted to making the four years' undergraduate course thoro and efficient, and there has been no time for fads and fancies. It is, however, customary to criticise those who are doing something well on the ground that they are not doing something else, so in accordance with that custom I would call attention to the fact that Cornell undertakes no shop courses, correspondence work, mechanics' institutes or evening classes; prefers not to devote much of the students' time to acquiring manual dexterity or to making their own machinery; does not believe in a minute specialization and the differentiation of undergraduate courses; has no system of industrial fellowships like Kansas or of alternating shop work and study like Cincinnati; and supports no engineering experiment station like Illinois. Whether these be virtues or deficiencies must be left to those who know more about it than I. But I will venture the opinion that the addition of a

(Observatory.

strong and well endowed department of research in applied science would be of benefit to Cornell as well as to the country. This would be in accordance with the Cornell spirit, at least the old Cornell spirit. The people there told me of the setting up of the first dynamo in America and the illumination of the campus by arc lights, and in the Sibley museum I was shown many historic machines, early turbines and gas engines, typesetting machines and telegraph instruments, but I could not find what I most wanted to see, that is, inventions bearing the same relation to the future that these old dynamos and turbines do to the present. Perhaps they had them, but were afraid I would steal the patents. Research in pure science is no longer discovery; it is invention. Most of the compounds used by the chemist, most of the electric waves used by the physicist, are not found in nature. It may come to be the same in botany and zoology. In research in pure science the universities have led during the last half century, giving their discoveries freely to the world. Is it not possible that the same method, that is, experimentation by public institutions for the benefit of the people as a whole instead of by private persons for their own profit, would result in greater progress and public advantage also in the applied sciences? As it is, the universities are generally content to follow the shops and often content to follow at a long distance. The average technical professor thinks he is doing pretty well if he can describe to his students the manufacturing processes employed today or even a few years back, without attempting to forecast or control the future. Yet even the purely educational function of a university would be more efficiently performed if students were prepared not merely for existing professions, but for those which are to be opened. In agriculture, which, as I have said, is the most enterprising branch of American education, this has been done. Several universities began to educate foresters long before there was any demand for their services. Cornell was one of the first in this field, but has abandoned it now, when Columbia, Harvard and Yale are actively entering it.

This year Cornell has established a course of training in professional limnology. Now, it cannot be said that there has been so far any public clamor for limnologists, but I am willing to believe that there may be a place for them and the profession is not overcrowded like the others.

I will, as usual, be specific in my suggestion, even at the risk of being absurd. Why did not Cornell University in 1901 offer a research professorship in aviation to Wilbur Wright of Dayton, O.? It was at that time apparent even to a layman that the problem of aeroplane flight had been brought within the range of practicality* and that he was exceptionally well fitted to promote it. Mr. Wright was recently offered a professorship of that kind by the University of Paris, which has received donations amounting to \$240,000 for aeronautical research and instruction. He refused it on the ground that it was easier to fly than to speak French. This objection would not have applied to Cornell, and it is probable that at a time when he was mending bicycles for a living and getting the necessary mathematics from his schoolma'am sister, he would have accepted the chair. If he had, and if he had not gone to sleep in it, the progress of aviation would have been smoother and more rapid; the Wright patents would be public property; America would have had an undisputed lead; and a half a dozen Cornell graduates would have known more about flying machines than the rest of the world or than anybody knows now. As it is, if any of the Cornell boys want to learn the science of flight they must either go to the universities of Paris, Berlin or St. Petersburg for instruction or else learn it as the Wright brothers did, in the University of Hard Knocks.† Of course Cornell and the other leading, I should say, foremost American universities will, in time, have to give some training in this branch of

*This paper presented to the Western Society of Engineers, September 18, 1901, appeared in the journal of December, and reprinted in the Report of the Smithsonian Institution, 1902. For free distribution to the public, contributed by the Smithsonian Institution, mental demonstration of this. In fact, it is remarkable how little has been added by the eight years of active investigation since, to what is contained in that article.

†This institution, altho one of the Great American Universities, is not included in this series of articles.

applied science, and they may in time catch up with the universities of Continental Europe, but it would have been cheaper and more profitable to have got in on the ground floor.

The reason why I am applying this to Cornell instead of to equally delinquent universities is because we expect more of Cornell. Cornell, in order to be conservative in the sense of being true to its traditions, must be radical and progressive, for that is the way it started. I do not mean to say that Cornell compares unfavorably with other universities in this respect, but does it not compare unfavorably with its former self? Is the university as conspicuous an educational innovator in any of its departments as it was a generation ago? Yet one would have to be very much of a conservative to maintain that educational innovation is not now as much in order as it was then. I realize and wish to make plain that Cornell is in a vigorous and healthy condition, is growing rapidly, is improving all the time, and developing in many new directions, but somehow I get the impression that it is now in its forties beginning to settle down, and I do not like to have Cornell settle down.

One indication of approaching maturity is perhaps the tendency toward conformity. The old Cornell, or rather the young Cornell, prided itself on being very different from the other Eastern universities. Now I fancy there is a desire to be as much like them as possible. Among other things, there is developing a spirit of caste and exclusiveness from which the Cornell of earlier days was largely free. This is usually laid to the fraternities, but not altogether justly, for, altho they manifest it most conspicuously it is due to more fundamental causes. It is to be found in institutions like Pennsylvania and Yale, where the fraternity influence is not so great, and is still more evident in Princeton, where there are no fraternities, while in the State universities, where fraternities are strong, it is not yet so perceptible. It is not purely a social exclusiveness, as is commonly supposed, but takes the form in the universities of an intellectual illiberality, even of an aversion to the greater diffusion of knowledge.

I here was in my time—in dealing with college students I am forced to acknowledge that I belong to another generation—a very decided propagandist impulse, a desire to spread our new ideas as widely as possible, to preach to the world the revelation of science which had been vouchsafed to us, to open the doors of the university to everybody. I can see now that this was a sort of priggishness, but it was an altruistic priggishness, which is a mitigating circumstance. The spirit was much like that which drove hundreds of young Russian students of both sexes to abandon homes and career to "go out among the people," tho devoid of their revolutionary and political aim. This was the era of the rise of the Chautauqua movement, of university extension, when Proctor and Tyndall and Huxley were giving popular expositions of the latest science in language hitherto unprecedented and since unequaled for clearness and force, and in almost every college professors were imitating them according to their ability.

Now it seems to me, in spite of the popularization being carried on in some directions, that this missionary zeal has very largely disappeared from both professors and students. Why I do not know; perhaps because they have lost faith in the all-sufficiency of knowledge, perhaps they are disappointed in the educability of the masses, but more, I believe, because the caste or gild spirit has developed. Our modern industrial professions are assuming the arrogance of the old clerical professions. As education has become more vocational the trades union idea has come in. An engineer who has invested \$5,000 or \$10,000 in an education as a capital for his life work does not want to give away his information. He is opposed to short cuts to knowledge and in favor of the limitation of apprentices. Raising fees and admission requirements is now not always looked upon as a disagreeable necessity, but rather welcomed as a good thing because it "keeps out the muckers."

Concomitant with the growth of this professional spirit comes a contempt for the non-professional students of the old college. In Yale, where the college and

the scientific school have been kept separate, we have the most amusing spectacle of the two sets of students trying to look down on each other, one from the vantage ground of the time-honored

course, the other uplifted by the consciousness of being more practical. So far as I could find out, neither party is having much success in making the other realize that it is being looked down upon.

Women as the weaker and more submissive sex, forming the majority of those who stick to purely cultural courses, get a large share of this contempt, and when they enter the professional departments, are in some places met with a cold shoulder. One way out of it I have previously suggested—the development of vocational courses for women, in which they can take a professional pride. But women have always been used to being treated with contempt, and if they don't get anything worse they have reason to think themselves fortunate.

After long consideration of the subject I have come to the conclusion that the disposition to discriminate against women which is shown by most Eastern institutions is due rather to these two motives—the caste spirit and the gild spirit, social and professional exclusiveness—than to any anti-feminist ideas or instincts. This can be clearly seen at Cornell, because here the two motives coincide, since, by a curious reversal of status the engineering schools have become fashionable and aristocratic. The sons of rich manufacturers of New York and Pennsylvania, for example, are apt to be sent to Cornell for an engineering course, while girls who have to support themselves by teaching are likely to go in for the liberal arts, so called because they are the arts that are liberal enough to give them a living. Consequently we have the spectacle of young men sitting on the porch of a luxurious fraternity house and criticising certain passing "co-eds" with an acridity almost feminine, expressing disgust because their clothes do not fit them and their hands are not neatly manicured. The criticism, altho unjustifiable, might not be unfounded. It might happen that the girl under scrutiny had not shown artistic genius or even creditable craftsmanship in the dress she had made herself, and that her hands were the worse for wear, for she, unlike her aristocratic critic, had slaved and saved for years to

ROCKETTEER HALL OF PHYSICS.

get an opportunity for the education which he obtains without sacrifice, and of which he would, if he had his way, rob her.

The class of young men who object to the presence of the young women is, however, small at Cornell; smaller than in the other Eastern universities, tho larger than in the Western. But as they are leaders in the fraternities, which here, as everywhere, dominate the society life of the university, they make themselves unpleasantly conspicuous at times. One episode will have to be mentioned, altho it is rather sickening, for it is a part of Cornell's social history. The leader of the Sophomore cotillon not long ago asked a university girl, his fiancée, to take part in that function with him. His associates thought this an undue recognition of the existence of the "co-eds" and prevailed upon him to break or get released from his engagement—the dance engagement—and take an outside girl instead.

The incident was unfortunate, be-

cause it caused some natural resentment even among those who were far from aspiring to the honor of leading a Sophomore cotillon, and more because it misrepresented the spirit of Cornell young men as a whole. They are not as a rule unfair or even ungallant toward their feminine colleagues. For example, when Miss Cook won the Woodford, a prize in oratory which has always been highly esteemed, it called out admiration rather than resentment. She also secured a position on the debating team, and when the Columbia boys objected to her appearance on the platform as one of their opponents, there was no thought of yielding on the part of Cornell. Such an incident, in my opinion, outweighs a hundred cotillons, tho perhaps not all young ladies will agree with me. The enthusiastic advocates of co-education in Cornell probably equal in number the bitter opponents. Some of the finest young men in the university have chosen Cornell in preference to Princeton or Yale partly because they believed in co-

education. The great majority of the students are altogether indifferent on the subject, and it is not to be regarded as a serious question.

The statement that at Cornell the young women are ostracised is a pure fiction, which a perusal of the list of married *alumnæ* would promptly refute. Two hundred callers on a Sunday afternoon is not an unusual number for Sage College, the principal woman's dormitory, almost one apiece, altho I presume they are not evenly distributed. At any rate, it does not look like ostracism. On the whole, I think the women in Cornell get as much masculine attention as is good for them, and I know that some of them get more than they desire. As for "social recognition," that is something which the "co-eds" may hope for, but cannot rightfully demand. In the State universities they get altogether too much "social recognition."

Within a few years of the opening of

Cornell the question of the admission of women came up. A committee, of which Andrew D. White was chairman, gave it careful consideration. They first wrote to theorists and their replies were mostly unfavorable. They then visited institutions where co-education was in vogue and found that their experience was mostly favorable. They fortunately decided to give greater weight to experiment than to opinion. So co-education was adopted and Sage College was founded, not an independent college like Radcliffe or Barnard, but a residential hall.

But Sage has kept a secret. The founder of the university was in favor of equality, but he had his misgivings. He wrote them in a letter and put it in the cornerstone. He did not think it would fail, but if it did he knew why it would, and he wanted posterity to know that he knew it. I wonder if any of the Sage girls have been kept awake by

curiosity to know what is in that letter. I have. What was the weak point which the shrewd old man suspected in its foundations? The chances are that it is something that the experience of a quarter century of feminine education has proved quite illusory, like most of the fears and not a few of the hopes enumerated in that curious old pamphlet, the Report of the Committee on Mr. Sage's Proposal to Endow a College for Women, 1872. One of the benefits which President White looked for as a result of the higher education of women, the reformation of feminine costume, is so far from having been attained that I must give his own words:

Among the curiosities of recent civilization perhaps the most absurd is the vast tax laid upon all nations at a whim of a knot of the least respectable women in the most debauched capital in the world. . . . Young men in vast numbers, especially in our cities and large towns, are harnessed to work as otherwise they would not be; their best aspirations thwarted, their noblest ambitions sacrificed, to enable the partners of their joys and sorrows to vie with each other in reproducing the last grotesque absurdity issued from the precincts of Notre Dame de Lorette, or to satisfy other caprices not less ignoble. The main hope for the abatement of this nuisance, which is fast assuming the proportions of a curse, is not in any church, for, despite the pleadings of the most devoted pastors, the church edifices are the chosen theaters of this display; it would seem rather to be the infusion, by a more worthy education, of ideas which would enable women to wield religion, morality and common sense against this burden, some perversion of her love for the beautiful. This would not be to lower the sense of beauty and appropriateness in costume; thereby would come an esthetic sense which would lift our best women into a sphere of beauty where the Parisian grotesque would not be tolerated; thereby, too, would come, if at all, the strength of character which would cause woman to cultivate her own taste for simple beauty in form and color, and to rely on that, rather than on the latest whim of any foolish woman who happens to be not yet driven out of the Tuilleries or the Bréda quarter.

I refer to the debating societies of Sage College the question why educated women as a class have in this particular completely failed to justify the confidence which President White placed in them. So far as the masculine eye can discern, there has been no improvement of feminine dress in the direction of economy, taste or hygiene, and college women, whether rich or poor, do not seem to show any more independence of

fashion or originality in esthetics than their unlettered sisters. The year 1872, when these words were written, was, if I remember right, the era of the pull-back and the polonaise, immediately succeeding the fall of the crinoline. We have seen worse things since, and the financial burden which was then "fast assuming the conditions of a curse," has enormously increased. We cannot today share President White's hope for relief thru the women's colleges, for the elevation of the standard of taste in general, if such elevation has been accomplished, has not shown itself in the realm of costume. Even the specific training in this department which has been recently introduced seems inclined to intensify the evil rather than to remedy it. It is impossible yet to say what may be done in Cornell, because the work in the domestic arts is barely begun there, but in Teachers' College, of Columbia University, there is a thriving department. I visited the exhibition of the best work of the advanced students last commencement, and I must say that I saw there more grotesque, ugly and ungainly hats than I have ever seen at large on the streets of New York. And the women who designed them were to be sent out thru the country as teachers of domestic art! But is it not possible that all critics of women's costume, from Isaiah to White, have misdirected their attack? May it not be that the reason for the failure of dress reform movements lies in the fact that feminine extravagance and bad taste are not, after all, feminine but masculine vices?

There are no sorority houses at Cornell. This is strange, for in some Western universities these are almost as many as fraternity houses. One reason, doubtless, is that the comparatively small number of women at Cornell are mostly taken care of at the residence halls, Sage College and its annex, Sage Cottage, on the campus, besides the unofficial Alumnæ House near by.

No provision at all is made for the boarding of the men and there is no general clubhouse, like the Harvard Union, or Houston Hall in Pennsylvania. Consequently the fraternity system is more highly developed at Cornell than anywhere else. There are thirty-five fraternity houses, some of them

very large and elegantly furnished. The earlier ones were given sites upon the campus and command beautiful views. Students not in fraternities are scattered about the city in private residences and small boarding houses. There is only one large private dormitory of the kind common in Cambridge and New Haven. The necessity of keeping up so many expensive chapter houses makes the competition for desirable recruits very keen. The rushing campaign is short, sharp and decisive,

undergraduate by seeing on his cap or pin inscriptions in Greek, Hebrew, Arabic, Assyrian, Sanskrit or Egyptian characters. At Cornell the scientific honorary society, the Sigma Xi, is more highly esteemed than its venerable rival on the literary side, the Phi Beta Kappa. Phi Beta Kappas are in fact not so popular as the Kappa Beta Phis, a group of young men whose ideals and mode of life are quite the reverse of those of the former society.

At the end of the first term there is

FRESHMAN-SOPHOMORE RUSH, 1909.
Freshmen captured and branded by the Sophomore.

and is strictly regulated in all details by pan-Hellenic rules. This quick work is said to have the advantage of keeping the fraternities more even in strength than where students are elected on longer acquaintance. Besides the house fraternities there are innumerable other secret societies of all sorts and purposes, and the stranger is very strongly impressed with the scholarship of the Cornell

apt to be room in the fraternity houses. Some are not merely desolated but emptied when the "busting-out notices" are issued from the registrar's office. Cornell has a reputation for hard work to maintain, and idlers are weeded out without hesitation or qualms. The Cornellian will not allow that any other institution can be compared with his in the amount of work required, except

perhaps the Massachusetts Institute of Technology. Students are admitted on certificate and the credit of the accredited schools depends on the record of their graduates. The list is frequently revised, and schools are added, dropped, warned, advised and reprimanded, according as their output keeps up to sample. As seems to be everywhere the case, the public high schools turn out better students than the private schools. A committee which investigated this question in 1905-06 found that 58 per cent. of the students came from public and 42 per cent. from private schools. Of the students from the public schools, 3 per cent. were dropped at the end of the first term; of the students from the private schools, 7 per cent. After the first term, 9 per cent. of the public school students were warned and 15 per cent. of the private school students. Consequently, the committee recommended that the certificate privilege be withdrawn from all the private schools.*

I presume that there is more good work done at Cornell than ever before, and probably there are as many self-supporting students as in the days when it was known as the "poor man's college." But of late another class has come in which has quite overshadowed them and given the institution a very different reputation in the country at large from what it used to have. Twenty-five years ago President White stated that:

"Neither the attention of the faculty nor my own attention, has been called during the entire year thus far to any offense of any sort, for which any faculty in the land would deem it necessary even to reprimand any student."

President Schurman could not now say the same. In fact he has said things very different.

Referring also to those Edenic days of 1884 Mr. J. F. Gluck, one of the Alumni trustees, testifies to "the total absence of a dissipated and boisterous class, or even of a jovial and happy crowd." If we ac-

cept this statement we must agree with him when he says further that the "conduct of the students for uniform excellence is probably without a parallel in the history of American colleges." But if he had been with me in the Dutch Kitchen last June after Cornell had beaten Harvard on the lake he would have seen a crowd which without exaggeration could be called "jovial and happy."

The university authorities have made special efforts during the last few years to suppress student disorders. The Sophomore-Freshmen conflicts have been ameliorated and the Senior banquet, which had degenerated into an official spree, has been sobered up. In his opening address last year President Schurman announced that "any man who gets drunk, if the authorities of the university can ascertain the fact, will be dismissed from the university." This has doubtless had a good effect altho the authorities of the university have not ascertained as many such facts as the police courts or the public.

In the promotion of these reform movements the student body has not taken an active part. A system of student self-government has long been in vogue but its officials have not always been truly representative of the great mass of the students. The honor system of examinations has been adopted in the colleges of law and of civil engineering, but not in arts and mechanical engineering. The students tell me there is about the same amount of cheating under one system as the other, but the evil is not serious in Cornell anywhere. I do not think the *morale* of Cornell in any respect is inferior to great universities in general, but the student body seems to be unfortunate in its leadership. Its chief efforts seem to be now directed toward preventing the faculty from cutting out the week's recess devoted to athletics in order to extend the working season, which is short, at Cornell.

The summer vacation is utilized by a large proportion of the technical students to get practical experience, and there is a summer session of six weeks, in which, however, the work is almost entirely confined to the college of arts, for the engineering departments so far are not inclined to take advantage of it. In fact, the university has from the first

*A useful exposition of the intricacies of this question is given in the report of Prof. Edward L. Thorndike, published as Bull. No. 1, U. S. Bureau of Education. He found that the public high schools and their teachers in general were better than the private high schools; also that the public school teachers had, as a rule, longer and more thorough training. Another interesting point he brings out may be mentioned here, altho it has nothing to do with the subject, that is, that the men teachers have, on the average, had less training, very little more experience, and are generally less efficient than the women teachers.

adopted a somewhat stepmotherly attitude toward the summer school, and is not yet ready to accord it full recognition. Instead of offering special opportunities for graduate work, as Chicago and Columbia do, and encouraging undergraduate students to enter it, as Harvard does, Cornell is reluctant to permit work to be done in summer for advanced degrees or for shortening the undergraduate course. In spite of the hesitancy, if not hostility, manifested by the faculty toward the summer session, it has grown and prospered amazingly, doubling in numbers in the last five years and improving greatly in quality.

graduate work from 227 institutions, of which the most prominent are:

Cornell	840
Indiana	52
Michigan	32
Ohio State	32
Smith	25
Toronto	24
Dalhousie	23
Harvard	21
California	20

There has always been an unusually large foreign contingent at Cornell, attracted chiefly by its reputation in engineering. The catalog of 1908 reports 70 students from Latin America, including 19 from Cuba and 12 from Argen-

THE NEW BUILDINGS OF THE NEW YORK COLLEGE OF AGRICULTURE AT CORNELL

It offers an educational opportunity that should be eagerly embraced, for Cornell is exceptionally favored by its location. The country, especially such a country as surrounds Ithaca, has attractions which will rival those of a large city, in the opinion of many summer students, and the climate is better than in New York or Chicago. There could be no better way of making known to all parts of the country the advantages of Cornell for advanced work than by developing a large summer session of high standing.

The geographical distribution of Cornell's *clientèle* is shown by the following figures. During the past twenty years 1,872 graduates have been admitted to

tina. There are 50 Asiatics, 33 from China and 10 from Japan. The Cosmopolitan Club of Cornell, composed of foreign and American students, is one of the oldest and most flourishing of these organizations. It maintains club-rooms and is planning to erect a large residential clubhouse near the campus. The presence of these young men from all parts of the world tends, like the hill-top site of the university, to widen the horizon of the Cornellian.

Architecturally, the Cornell campus makes a pleasing impression on the visitor, notwithstanding that it is without systematic arrangement or consistency. This is because the buildings are so picturesquely placed and are scattered over

such a large area that they do not come into conflict. One of the reasons why Cornell differs from the State universities is because it has from the start given recognition to the esthetic element in education, instead of having to graft this on after years of crude utilitarianism. Symbolic of this, the McGraw chimes rang out at the dedication of the university in 1868. The Sage chapel and memorial apse are decorated in painting and mosaic with a lavishness unwonted in America.

Both Director Smith, of the College of Mechanical Engineering, and Director Bailey, of the College of Agriculture, have so far forgotten what is expected of men in their position as to write poetry, and publish it, too. Poetry is allowed to creep into the bulletins of the Agricultural Department, also decorations and pretty pictures, even funny ones. Liberty Hyde Bailey has a twinkle in his eye; you can see it even in print. He is distinguished among the directors of experiment stations by his discovery that a man could be scientific without being solemn, and that bulletins intended for the people could be made readable without detracting from their value. The students and professors over in the agricultural building believe in art, and what is more, they practice it, the art of presentation in all its forms—writing, drawing, painting and oratory. The young men who go out with the educational train make as many speeches in a day as a Presidential candidate swinging around the circle, and they are harder speeches to make, for it is easier to persuade a crowd of farmers that you

know more than they do about politics than that you know more than they do about farming. The propaganda spirit which it seems to me has declined in general is more active than ever in agriculture. The young men and women go out from the Cornell college of agriculture with something of the zeal of missionaries, spreading the gospel of applied science and applied art and the love of nature in her various forms. Five series of publications are issued from Cornell for the education of the people of New York State: The bulletins of the experiment station with the results of investigations; the Home Nature Study Course, the Rural School Leaflets for both teachers and pupils, the Farmers' Reading Course, and the Farmers' Wives' Reading Course; all of them attractively printed, illustrated and well written. Here is nothing of the professional or trades-union tendency to monopolize knowledge. Perhaps it is because Professor Bailey insists that the college of agriculture is not a technical institution, training for a single profession. He is trying to give "a liberal education in terms of country life."

"All civilization develops out of agriculture and occupations, and so it comes that agriculture is properly a civilization rather than a congeries of crafts. The colleges of agriculture represent this civilization, in its material, business and human relations. Therefore, they are not class institutions, representing merely trades and occupations. The task before the colleges of agriculture is nothing less than to direct and to aid in developing the entire rural civilization."

Such an ambition is a worthy expression of the true Cornell spirit.

GREAT AMERICAN UNIVERSITIES.—This is the tenth of a series of articles on the present condition and future prospects of the larger universities of the United States by one of the editors of THE INDEPENDENT. The dates of publication of these articles are as follows:

The American Wife and the Dot

BY CAROLINE E. MacGILL

AMID the manifold discussions of *das ewig Weibliche* there has arisen of late a parlous cry. 'Tis that when joined to *das ewig Mannliche* in a "life sentence at darning his socks" she becomes the inmate of a private almshouse. This condition is said to prevail whether the lady in question is the type who would rather play bridge than Bridget, or she who is most addicted to the game of the checkered apron. Whether we be of New England ancestry or no, we all object to such a stigma, and our deepest psychoplasm rebels at the imputation. Still, these writers demand that madame shall be summoned to the bar of economics to show cause why she should be considered outside the ranks of the defective, dependent and delinquent classes. There is certainly precedent for so placing her, for by our suffrage laws she belongs there anyway.

Now, of course, when the whole trend of modern philanthropy is to eliminate these undesirable citizens as speedily as possible, there are many kind and learned souls who pay much attention to the problem of the dependency of the housewife. Two solutions of the situation appear to be rivals for popular favor. One is to offer the civic efficiency test of wage earning as a standard for all and each person of adult age. The result is a circular species of reasoning very curious to contemplate. It is that if a wife and mother goes into the market and earns by her skill a certain amount of hard cash by which she may pay a servant for keeping her house and minding her children, she thereby becomes an independent and productive social factor. Whereas, if she stayed at home and did the work herself she would not be "earning her living." It is the more curious that this idea is held by the very women who ought to know better! The writer met not long ago a dear little lady, a college graduate, back for her ten year reunion. She was the wife of a professor in a small Middle West college, where neither his salary

nor opportunity would afford a maid to assist her. Her hands were rough and showed unmistakable signs of hard work, and her face wore lines of care upon it. Her beautifully trained six-year-old son was the envy of many there, and she mentioned a little girl too young to be brought with her. Speaking to a group of teachers in her alma mater she said: "I know I've got everything I want most in life, and yet sometimes, when I think of you girls here, and look back upon the days when I taught just after I graduated, I wish I could be *earning my living again*." It is granted that if the married woman earns wages outside her home and pays a servant to do the menial work, she probably makes a sum over and above the amount so paid out, but *the deficit of service is forgotten*. Only the laziest and most inconceivably incompetent of women would do less for **the comfort and happiness of their own homes** than a hired servant, and it is not this class who would be able to earn good wages outside. One wonders if any woman can really think an ignorant girl more capable of taking care of her babies, to say nothing of her husband, than she would be. Of course, the wisdom of our ancestors as exprest in popular proverbs is too far out of date for our modern notions; yet one is impelled to recall the adage that a "penny saved is a penny earned." Several of the most learned of the professorial economists not so long ago engaged in a heated discussion of the question whether savings were capital or income. I don't think they have decided it yet, either to their own satisfaction or any one else's, but it raises an interesting question as to the ultimate analysis of the family income, where money is spent in servant hire that would otherwise be spent for the direct benefit of the family or put in the savings bank. It makes a nice problem in bookkeeping.

The United States Census Bureau adds its mite by excluding housewives from the list of those women "gainfully employed." Yet if one of these passes

from the labors of the cook-stove and broom to become a "lady-housekeeper" for some over-rich captain of industry, tho her duties be merely as to keys and dignity, Mr. Census Man immediately recognizes her rise in the economic scale. Mrs. Farmer, who cooks for an indefinite number of hired men, washes, scrubs, makes butter, tends the chickens and garden sass, needn't live in such terror of the county-house, for if she does come there at last she will experience no change of status. Mrs. Carpenter, Mrs. Smith, Mrs. Weaver, Mrs. Butcher, Mrs. Shoemaker, Mrs. Mason, Mrs. Clark, all the worthy dames whose energy and toil-worn hands keep comfortable and tidy the rows upon rows of little homes in our towns and villages, add nothing by their labors to the incomes of the families housed therein, because forsooth, they receive no pay for them.

The second solution offered is based upon observation of the difference between American women and their European sisters, who are in this respect, as well as many others, in a so much more favorable position. The Continental wife, provided with her dowry, or *dot*, need have no fear of being dependent upon her husband, for she is clearly an asset in the matter of income, not a liability.

A certain learned judge, writing of the law of husband and wife, says that in the early days, before the true position of women had been recognized, the husband was supposed to take for his own the property of his bride, as a recompense for the expense to which he was about to subject himself. Sociologists, going a step farther into the matter, talk about this transfer of property as a survival of the time when a woman was merely property herself, and passed along with her jewels and clothes into the hand of her new owner. In days gone by, when some of us American women have contemplated this custom as it exists in Europe, when we have heard of the societies founded to provide portions for girls otherwise ineligible to matrimony, we have let the eagle scream a bit, and prayed the Pharisee's prayer. We have rejoiced in the fact that in free America marriage is for love, and not

for revenue only; yet our philanthropic friends assure us that in that very fact lies our greatest defect. If we, as the thrifty Frenchwoman, would be assets instead of liabilities, we must provide ourselves betimes with *dots*.

Wherefore, let us see how that may be done. The proper French *jeune fille* is provided in that matter by her fond parents. Therefore, the American father must do likewise, or else the American daughter, who is teaching, or typewriting, or standing behind a counter, must save, save, save, to buy herself a husband. Maybe from a purely economic point of view, any additional incentive to saving must be *ipso facto* a good thing, as tending to lessen extravagance and increase the supply of capital, but from the point of view of the young woman herself it is likely to be disastrous. Man, being a bird of dull plumage, appears to prefer his mate the opposite, and the saving young woman would be likely to find herself hopelessly cut out by the wiser virgins who used their surplus in the purchase of smart clothes with which to snare the susceptible masculine. And if in pursuit of the *dot* one lost the husband, what a horrible catastrophe! So the only really safe way is for the American father to rise to the occasion and provide the cash. It is always assumed by these merry writers that the American father will at once recognize the beauty of this proposition, as well as the American daughter, and the American young man. Supposing we put it up to each of them and see what they would say. Paterfamilias loves his daughter dearly and would do a good deal for her, but this seems pretty tough. He is asked to rake and scrape when he is already engaged in that business to what he had supposed the best of his ability, to deny himself even his favorite cigar and yearly fishing trip, to hand over the proceeds thereof to a husky youth who, under the present young man industrial régime, is in a much more desirable position than his prospective father-in-law. Do I hear a rumbling echo from the wilds of British East Africa? Methinks I do, and it sounds like "mollycoddling!"

Next, what about the American daughter—is she waiting around for

"Dad" to marry her off to the hungriest applicant for his bank account? Not so you'd notice it. She is out after "Mr. Wright" on her own hook, and he isn't the youth who's after any one's bank account but his own, either. Meanwhile she's taking care of herself one way or another, and letting her father put by his savings for his own rainy days. She is ready for the comradeship of marriage, and for the hard work, but she is not ready to add another burden to the father who has cared for her so loyally up to now.

Lastly there appears the American young man. What is his verdict? He is no mollicoddle; on the contrary, he has a healthy notion that for a man to be so low in the scale that he must ask his wife's father to help him support his family is about the deepest depth of disgrace. If his wife happens to have property, that is purely her own affair, and he regards with supreme contempt the man who "marries for money." An honorable man's business is to take care of his family himself, not to marry to be taken care of, like the darky who retired from active life after taking to his bosom a cullud lady with a large wash practice. The French system does not seem to possess a prepotent charm for him.

There is a beautiful want of logic in this *dot* theory. Maybe it is the traditional feminine lack in that respect cropping out; I will not venture an opinion. Anyway, to the man in the street, there would seem something a trifle peculiar. Let us make the case concrete. John Carpenter marries Lucy Clark. Like all young couples, they have a dim dream of the twilight path down which they shall go, hand in hand, their children and grandchildren around them. They cannot provide in advance that none but sons shall be born to them, nor would they desire it. Each daughter, however, presents a very real problem. John's wages are not large, and in the nature of industry they are more likely to decrease than increase as he grows to middle life, and can no longer compete with active youth. An appropriate *dot* for little, curly-headed Jennie would be, say, five hundred dollars. One couldn't endow a great deal of financial independence on less. So John Carpenter is

confronted at the very beginning with the question of five daughters at from a thousand to twenty-five hundred, or one daughter at a thousand, or two at the same. Obviously, to the man out for a wife with a *dot* the larger sum will be the more attractive, and, of course, the fond father wants his little girl to have the best the market affords. But he faces this also: If he has to save so much for his daughters he cannot afford to spend much on his sons, and as he cannot absolutely insure that only so many of either sex will be born as will be perfectly convenient, the only remedy is to cut off on the population supply when there are as many little Carpenters as he can safely look out for. Again methinks I hear a rumbling from British East Africa. And really, we have never envied the French birth rate; it doesn't seem to pay.

Let us suppose again. This time, under the beneficent workings of the system, two daughters are brought into the world by Lucy and John, and that they have grown to womanhood. A thousand dollars is carefully put away in the bank, waiting for the day of their departure with the young men who have decided that a five-hundred-dollar article in a wife is about their style. There are, of course, three ways in which the money may be employed. It may be spent at once, in furnishing the house; or it may be divided up into yearly instalments, based on the insurance tables of the probable length of life to be enjoyed by the brides, and the resultant quotient spent each year; or it may be invested. In the last case, if a wonder of careful management were given to it, it might yield a small interest, or even a profit that would buy numerous things about the household. But what are the probabilities that the latter will happen? Not very likely, even the most ardent advocate of the system would have to admit, and we cannot predicate either perfect health, perfect business acumen, or unbroken employment. Life is too uncertain nowadays for even the most honest and industrious and skilled of workingmen. If the money is spent at once, in the furnishing of the new home, or in some similar way; or if in the course of a few years the store vanishes

under the stress of long unemployment or illness, behold the tragedy! The "independent" wife, the source of her independence being gone, is in the same lamentable position that her undowered sister has been all the time. Poor thing, she finds her fancied glory but ashes, because it was based upon such perishable things.

Work, hard work, disagreeable work, washing dishes and peeling potatoes, scrubbing floors, making bread and cooking steak, all the weary round of it all, in the isolation of the farm or the cramped, overcrowded city, work with the constant interruptions of child-birth and child-care, all this is *dependent*, done for no reward save that intangible one of virtue, and the charity of the husband. Yet if she could do the same work for some other man she could earn four or five hundred a year and her board, too, for the equivalent labor—or less! Surely our friends who demand the "economic independence" of the married woman are wide of the mark when they esteem the ability to contribute a cash sum yearly, which must in the vast majority of cases be very paltry indeed, of more real worth to the family than all the daily labor of the housewife. The lawyers have for once a far better

theory on the subject than the sociologists. They recognize a property right belonging to the husband in the services of the wife as housekeeper and housemother, a right arising out of the marital relationship itself. It is a right that, if injured by third parties, as in a railroad accident, renders such parties liable for damages. The law holds this right of the husband to be the legal return to which he is entitled for fulfilling his obligation to support and maintain his wife. The money or other property which the wife happens to have is considered to be wholly outside the marital relationship, and in respect to it the husband has no more rights than he would have over the property of an unmarried woman, during the lifetime of his wife. In the eyes of the law, therefore, the husband's right of *consortium*, the "aid, assistance, comfort and companionship" of his spouse, is the very real and tangible means by which his wife "earns her living." It is surely reasonable. It would be a strange folly if in this enlightened age we could have no measure of value but that which is expressed in terms of definite money payment. The *dot* system, like the common law by which it once was justified, is a relic of barbarism, to which we should be scarcely anxious to return.

MADISON, WIS.

Pathfinders

Hendrik Hudson—Robert Fulton

BY EMILY HUNTINGTON MILLER

ONE sought a nearer way to Orient lands

By stormy seas, and bleak unfriendly shores;

And knew not that his keel had touched a strand

Where East and West should bring their richest stores,

But passed to quench the splendor of his dream

Where icebergs in the chill aurora gleam.

One caught and bound with magic chain and bar

A subtle spirit—strong, exultant, still—

And said, "There is no longer Near nor Far;

Lo, here are wings to speed you where you will!

Yours are the highways to each waiting land,

The Isles of Spice, Cathay, and Samarcand."

WHITE BEAR LAKE, MISS.

Baron Shibusawa

BY YONE NAGOUCHI

[The following interesting sketch of the leading business man of Japan, who is now traveling thru this country at the head of a large party of Japanese bankers and merchants as guests of the various Chambers of Commerce of the cities of Oregon, Washington and California, is most timely. It is the first instance, we believe, that a large party of foreigners have come to our shores on the invitation of representative Americans. It is an example of international hospitality that is sure to be followed much in the future. Mr. Nagouchi is a Japanese poet and author of note.—EDITOR.]

IT was Walt Whitman who saluted, in "The Broadway Pageant," the first Japanese delegation of *samurais* of two swords and fantastic queues, led by Prince Iwakura in 1872. Our new delegation that is just entering America is second only in importance. They may

English. However, many a point has been missed in the telling which should be emphasized; I am here to jot down some of them.

To begin with, he is by no means a rich man. He is a pigmy in money beside the men of Iwasaki or Mitsui, even

BARON AND BARONESS SHIBUSAWA.

not make a poetical subject in itself, for their gorgeous kimonos of silk brocade of the former days have been cast off for simple sack coats. They are business men. While each of the delegates is a man of distinction and achievement, there is one towering figure; in fact, the leader. He is Baron Shibusawa, and his life has often been briefly written in

of Yasuda or Murodo; but our public respect places him on a high where these richer men hardly aspire. It would have been not a difficult feat, I believe, for him to amass a far greater fortune with his prophetic foresight and most cautious dash; but his greatness lies in his tireless thought of the nation's welfare before that of his own self. He was

one of these *Yukoku no Shishi*, or patriots, in his younger days, who swarmed into Kyoto, and raised a vigorous cry for the reverence of the Emperor and the expulsion of foreigners. It is a contradiction—however, not difficult to understand—that these propagandists of foreign hatred, when their minds awoke to enlightenment, became in the course of less than ten years the greatest friends of the foreigners. Before he went to Kyoto in his twenty-fourth year he stayed in Tokio meaning to study, and from the sheer madness of patriotism he plotted with less than seventy men to turn Yokohama to ashes; the intrigue, however, was stopped under the advice of a friend who returned from Kyoto with a wiser opinion on the state of the country's affairs. In his thought foreigners and their existence were dreaded as a potential cause of Japan's fall.

The story of his younger days is as interesting as that of any of the *genro* statesmen who built new Japan politically. And it was Baron Shibusawa that made the new Japan in business; it is proper to call him the father of business men in Japan. His work may be only equaled by that of Prince Ito, whose achievement with the reins of government looks grander, but of their relative merit we may speak further.

He was not a *samurai* originally, altho he took on the form of retainer to the Hitotsubashi clan, one of the branches of the Tokugawa family, and from which the last dynasty of Shoguns sprang in the person of Keiki. He was born in 1840, in the village of Chiaraijima, of the Musashi Province, about 45 miles from Tokio. His father was in the business of selling indigo. Unlike his countrymen, he was well informed in Chinese classics. It was his idea to make his son his successor; but he was a child of the age of turbulence when, as he thought, any one could become a hero, and being dissatisfied at home, he left his village for the center, where he could be somebody. He was glad, then, to become even the lowest rank of *samurai*, and be given a chance to associate with the men of the time. I read, however, in his "*Amayo no Monogatari*," or "The Rain-Night Story," how he was sent in his fourteenth year into the country towns to buy indigo, and used his wit and tact when

no sellers took him seriously. Doubtless, he had no small business instinct from his childhood.

When Prince Keiki was called upon to succeed Iyemochi as Shogun in Yedo (now Tokio), he took Shibusawa with him thither from Kyoto. Shibusawa became an officer of the Shogunate government for a while; till an opportunity fell on him in a strange shape. Prince Minbutaiyu, a younger brother of Keiki, was announced to be sent to France to study the Western institutions, and Shibusawa was appointed to be one of his suite. He was then twenty-seven years of age. His stay in Europe was less than two years, but you can see without explanation what knowledge he reaped for his future use. When he returned home he found that the restoration had been enacted already. It was a kind of *samurai* etiquette, he thought, not to accept any appointment from the new Government, and to devote his whole life to agriculture and commerce at Shizuoka, the place of Keiki's retirement, whither he hurried. His ability was too great to be hidden, so that he was forced to receive the appointment of chief treasurer of the Shizuoka household, in which capacity he arranged the family finances. And soon the invitation of the newly formed Imperial Government at Tokio was forwarded to him, which he wished to decline, but came up to Tokio to become tax controller in the Department of Finance, under the Minister Okubo. He was immediately promoted to be Assistant Vice-Minister of Finance and Chief Inspector of Trade, and then Junior Vice-Minister of Finance to Bunta Inouye, the present Marquis Inouye. When Inouye resigned in consequence of a difference as to the budget estimates, he also resigned, and when Inouye resumed the same office again soon afterward, Shibusawa's refusal was final, altho he was strongly urged from many quarters. His official life thus ended.

New Japan was not, in the strict meaning, a revolution or a creation of the people, but the most ambitious attempt of the then young *samurais*. They cried first "*Joi*" ("Out with the barbarians or foreigners") and "Reverence for the Emperor," and then, "Opening of the country." Tho their cry was thus various, their central plan was to estab-

lish their own ideal government, which fortunately resulted as we see today. At the beginning of the career of the new Government, everything was patterned upon the Western nations, whose first influence appeared in the forms of politics and law. Since the Government was not the creation of the people, there is no doubt that the officers were nothing but dictators; indeed, it seemed at once that they were a thousand steps too far ahead of the people, who found it difficult to follow. It was only natural in these days to create a general atmosphere of "respect for the Government and contempt for the people." It was harder than one can imagine today to leave the Government's office then, as did Baron Shibusawa, as if it were worn-out sandals, as we say. It was still the time when we could not forget the conception of the "feudal days, and we utterly despised money and business in any shape. It was the most courageous action for him to come down among the people and become one of them. He thought that the nation was not a nation without the people whose financial strength must decide her future; such a thing only a few wise men could see in those days. It almost terrifies us when we think of our state of ignorance at the beginning of the new *régime*. A man of business was unknown then, such as Shibusawa became amidst the great disapproval of his friends. His achievement of the last forty years is just a story of wonder. There is one other great person beside him in Yukichi Fukusawa, the founder of Keiogijiku or Keio University, who stood as a protest against the age, and advocated the power of money and the respect of business; however, he was only a preacher or a man of pen and tongue. Baron Shibusawa was the practiser in the full sense. The work that he started alone gained speedily many followers; he gradually opened the road along which the nation began to make a normal advance. He was not, however, without recognition when he was given a peerage by the Emperor in 1890. It was the first occasion in Japanese history to place a business man on the highest level officially.

It suffices to say that there is almost

no business or enterprise for the commercial development and national advancement with which he was not connected after his resignation from the Government in his early days; it is said that he had some forty-one companies of his connection in one way or another, when he announced his retirement from all of them except the presidency of the First National Bank, which he originated, some months ago. If we have any representative of our country in commerce, that man is Baron Shibusawa. To call him merely a business man does him hardly any justice; he is ever a patriot, as he was in the time of the Restoration, and thinks first of the nation's prosperity before anything else. It is not a wonder that he is universally loved in Japan, tho he is a business man. Some ten years ago he wrote precepts which his whole family are enjoined strictly to observe:

"Bear in mind patriotism and loyalty, and you must not neglect to serve the people."

"Be true in your word, be respectable in your conduct; and you must be sincere in dealing with men and things."

"Be near your good friends, be parted from bad associates; and you must not, under any circumstances, make one fawn upon you as your friend."

"Make respect important in meeting with people; and you must not lose it even in the place of feast and pleasure."

"You must put your whole body's spirits in doing a thing, and must not make light even of the smallest affair."

"You must not be proud of your wealth, must not grieve over your poverty; but you have to improve your knowledge, administer your conduct, and aim at the truest happiness."

"As the mouth is often the gate of misfortune, you must always be cautious of what you speak."

He has been an ardent student since his boyhood. He wrote in his "Rain-Night Story":

"I was sent round to offer the New Year's congratulations when I was eleven or twelve years old. I walked with a book, and while reading it fell in a ditch and spoiled my spring dress. I was scolded by mother when I came home."

He is a fine scholar in Chinese classics, like his father; his occasional Chinese verses are often admired by scholars in that line. He found a fountain of wisdom especially in the book of Confucius, and his liberal understanding of the book made him able to discover the meeting point with the true Christianity.

Airship-Destroying Automobiles

BY MAX A. R. BRÜNNER

THE great success of dirigible balloons has created a demand for the invention of means to destroy them in war time. Of these the fire from rifles and machine guns was not sufficient, on account of their small caliber and the difficulty of watching the moving airship. Cannon have therefore been designed in Germany—the greatest manufacturing country of war material—for the sole purpose of attacking and shooting balloons, flying machines, and the like. To do this effectively such a cannon must comply with the following requirements: Unlimited moving ability sideways, shooting at any angle up to the vertical, highest speed of the projectile or smallest time for flying. In addition it must be possible to move the gun from place to place in the shortest time.

The automobile illustrated herewith

complies with these many and difficult requirements. It has been built by the famous Krupp concern and was exhibited in the recent international aeroshow at Frankfort. The fact that the gun is rather long favors a high speed for the projectile. Above it is a brake with a liquid and air compressor. When a shot is to be fired the bolting of the gun is disengaged and the latter slides out by the expansion of the air. The total weight of the car is 4,315 kilograms, and that of the gun alone 450 kilograms. A 50 horse-power engine is mounted under the hood and propels the vehicle with a speed of 70 miles an hour-average. All four wheels are connected with the motor, and thus any rough ground and steep grades can be overcome. On the platform seats for five men are provided, and room for thirty-two cartridges.

AIRSHIP GUN.

BALLOON HIT BY GUN AND EXPLODED

The cartridges deserve some description, as they have some novel features. It is necessary to watch the path of a projectile if applied to a balloon. Shrapnel hit only the cover and these holes are mostly closed again by the inner gas pressure, so that not much gas escapes. The best result comes from brisance grenades, which explode inside the bal-

loon and not only hit the envelope, but ignite the gas. Thus an airship will be completely wrecked, as the photograph shows. Another valuable feature is that each projectile contains a burner ignited as it leaves the gun, and this produces a wake of black smoke, showing the line of flight by night or day.

BERLIN, GERMANY

Unconquerable

BY ELTWEED POMEROY

AUTHOR OF "BY THE PEOPLE"

IT was a station on a new railroad in a new country in Texas. Around lay the desert scantily clothed in mesquite and cactus. Nearby a raw new town was smeared. It was June and the stifling Southern heat was only slightly mitigated by the usual arid country breeze. The tracks stretched sweltering and hot into a monotony of distance, and over them the single daily train panted to a stop. The conductor got off wiping the perspiration from his face, and helped a slight girl with a baby at her breast to alight. After her came the husband, a slender, young carpenter. He left her at the station, got a team and drove to

the land he had bought with a small load of lumber. Later he returned and took his wife and baby and their household gear, consisting of a few small boxes, a cooking stove and his kit of tools.

I was worried lest they might have no place to sleep and walked out to see them in the evening. She was sitting on the boxes in the uncleared wilderness, looking weary but with a smile on her face. The baby, healthy but tired, was just whimpering on a shawl on the grass at her feet. Night was coming on and she was getting some supper, while he was planning a place for them to sleep under the stars.

Later a kind neighbor who had five children in a half-finished, four-room cottage, gave them supper and took them in to sleep. But while sitting there, prepared to stay over night in the open, the tired woman turned to me with a happy smile and said: "Well, we have a home if we haven't any house." The woman's intuition unconsciously struck the keynote of the situation, tho the husband's thought and purpose were identical.

Foreigners often wonder how it is that the Anglo-Saxons have spread over the world, possessing it. This hunger for a home, this reliance on themselves, this willingness to face hardship and desire

to get a living not from their fellow-men but to wrest it from nature, are the secret. That tired family, leaving home and friends and with too scant resources to afford even one night at the hotel, ready to camp in the wilderness as long as it was their land and making that land their home as soon as they touched it, is typical and of tremendous import of Anglo-Saxon self-reliance, initiative and home-building. Unconsciously that woman was sublime. A race that can produce women who, sitting in a wilderness, can say: "We have a home if we haven't any house," is unconquerable.

BROWNSVILLE, TEX.

Shall the Government Issue Bonds to Develop Waterways?

BY E. J. BURKETT

UNITED STATES SENATOR FROM NEBRASKA

THE development of our internal waterways seems to have struck a popular chord with the American people. But the more serious and practical question is, Will they all approve of the issuance of several hundred million dollars' worth of government bonds to pay for it. Before Congress will undertake the work it will want to know not only that the people favor this great internal improvement, but also that they will sustain Congress in voting the bonds. Men may permit themselves to be carried away with the idea of waterway development, without much thought of the cost and with little knowledge or concern as to how the cost shall be provided. One such person called on me within a year to urge the importance of this internal improvement to the extent of five hundred million dollars. When I told him that the real question was whether or not he would approve of Congress issuing bonds and going into debt for the five hundred millions he hesitated and finally concluded that he did not want to see the government go into debt. But that is the real question, and enthusiasm for waterways, unless

coupled with a readiness and willingness to issue bonds for the amount required, will be of no avail. The government does not have the money at hand for so large an undertaking. It could not raise it fast enough by taxation to complete the work, and if it could it would not be proper to make this generation pay so large a sum for work that few men now living could get much benefit from. The question is, then, Shall we break away from our teachings and traditions of the past and launch forth upon this new undertaking? Shall we begin this great work for all the ages to come, even tho in doing so we must trample upon some of our political ideals.

The American people have learned to dislike a national debt. It has been the dream of every American that the good day will surely come when our national debt shall all be paid and when no bond of American liability shall be hawked about the market places of the world. But can we afford longer to neglect opportunity for a fetish and abandon duty for tradition? Idealistic as it is to keep out of debt, it is not practical always with men or nations if they would

achieve in the largest way; and dear as traditions always are, they are not to be compared in obligation to duty with our responsibilities to the future.

Every generation has been called upon to do some great work, to solve some great problem, and to make some great sacrifice for the future generations of Americans. First was the Revolutionary War of the fathers that their children might have liberty. Then the Civil War by our more immediate predecessors that their children might be one in political affairs and affection. One generation defied almost the Constitution itself that the future generations might have homes, and every generation has wrought that its successor might have improved opportunity. We of today with our unlimited credit and cheap money owe to our successors our endeavors for their welfare. If greater transportation facilities are needed now, what will it be with the multiplied millions of a half century hence? If commerce needs more economical transportation now, how much greater will it need it then; if the brains of men must be racked now to cheapen production sufficient to the demands of consumption, how much more difficult will the problem be then. While we and our predecessors have wasted millions our successors must be prepared to save the pennies. They must harness the waterfall for power and utilize its flow for economical transportation.

While it is our duty to undertake this great work, it is not necessary or proper that we should pay for it all, any more than that the Revolutionary War should have been paid for by the fathers of the Republic, or that all the cost of the Civil War should have been paid for by the same men who fought its battles. It is no less our duty to begin this great work for the benefit of future generations than it was for other generations to do what they did. We would be as recreant to our trust as Washington would have been negligent of his obligations if we should hesitate because of the great expense and national indebtedness that it would imply.

We have not only been wasteful as individuals in the past, but we have been extremely careless of every rule of econo-

my in our industrial and commercial affairs. It has been so easy to produce from the virgil soil, and markets have been so ready at almost any price that we have been too little concerned at the loss between the producer and the consumer. This cannot always continue. I had occasion recently to investigate, and found that the people of Nebraska lost nearly twenty millions of dollars last year on their crops as compared with Kansas by reason of larger transportation charges. Kansas has railroads to the Gulf, is closer to the seaboard, and the difference in price received for a like amount of corn, wheat, oats and other agricultural products that Nebraska produced, amounted to almost twenty million dollars. Corn in Kansas was four cents more than in Nebraska. Wheat was six cents more. Oats and barley five cents more. Based upon the entire production of the State at these differences the loss was almost twenty million dollars to Nebraska. No doubt there would have been a difference in price even with a system of internal waterways, but the difference would have been less on account of the cheaper transportation. Kansas and Iowa and Missouri are all losing enough every year by reason of their transportation rates to more than pay the interest upon the most extravagant amount mentioned as required to develop an internal waterway system. What is true of the Mississippi Valley is equally true of other portions of the country. While the soil is new and the expense of production comparatively cheap the producers can stand it, but when conditions are changed by lapse of years a more economical method of reaching the seaboard must be had. The great master minds of transportation have called attention to this and have admonished us of our duty. They have pointed out the physical inadequacy and the economic incompetency of the railroads in the years to come and have warned us to be prepared against the emergencies of tomorrow. They have told us of the need of a cheaper transportation for certain kinds of freight. We should take possession of the great Mississippi and Missouri and Ohio and other rivers for the purposes of commerce and where nature has not pro-

vided us with canals we should build them. And because we cannot and ought not pay for them now we must charge them to the future. The Panama Canal has been a precedent for us in this particular, and surely if we are justified in issuing bonds to aid the commerce of the world, we ought not to hesitate to do as much for our own people and the com-

merce of the forty-six States of this republic.

The question then is not the desirability of the system, for that is settled, nor the plan of its execution, for that will come thru skilled hands, but the greatest of all problems is to arouse the American people to sustain Congress in providing the means.

LINCOLN, NEB.

Dr. Cook at Copenhagen

BY THEODORE STANTON

I ARRIVED in Copenhagen on the same day as Dr. Cook, two or three hours after his enthusiastic reception by the official world and the people of the Danish capital. The next morning I met Mr. and Mrs. Edwin D. Mead, of Boston, who happened to be on the quay when Dr. Cook disembarked and who were the first Americans to greet him, if we except the American Minister. "What impression did he make on you?" I asked. "He is a simple, modest, genial man," was their reply in chorus; "and roughly attired as he was, with a plain cap on his head, he was, by the very lack of dress, the more conspicuous, surrounded as he was by the ceremoniously attired gentlemen who had gone out to meet him. In a word, he looked just as a traveler coming from the Pole should have looked, and the democratic population of Copenhagen seemed to like him all the better for coming among them just as he was."

An hour after I reached Copenhagen I went to the American Legation, where I learned that Dr. Egan was at the Palace presenting Dr. Cook to the King. But between the landing and the presentation Dr. Cook had had time to go to a big clothier's and procure a ready-made dress suit and a top hat. The remarkable cordiality of his popular reception at Copenhagen comes out in a curious way when I state that when Dr. Cook went to pay for his new clothes, the head of the store said very simply, "Let me have the honor of making this little gift to the discoverer of the North

Pole," and he could not be induced to receive even an *ore*.

At the Legation I found the intelligent young secretary of the Minister, Mr. D. K. Laub, of Washington. "Well, what do you think of him?" It was the question I was continually putting at Copenhagen, and with a purpose. Mr. Laub replied very modestly: "I am not awfully old and have not had much experience of men, but Dr. Cook makes a deep impression on me for sincerity, as he does, in fact, on everybody who approaches him. Here we are all convinced that he got there." Mr. Laub only reflects the opinion of his chief, who a few days later said to me twice: "As to the moral man, I consider Dr. Cook perfectly incapable of acting the lie which some would have us believe he is acting. He is unquestionably perfectly honorable and honest. As regards the scientific side of this affair I am incapable to judge. But this has been done for us by the highest and most competent bodies of Denmark, and I am quite ready to accept their conclusions, which are all favorable to Dr. Cook."

I journeyed back from Copenhagen to The Hague with Mr. W. T. Stead. "Why is it that the London *Daily Chronicle* is about the only great European journal which seems to come out squarely against Dr. Cook?" I asked of the editor of the *Review of Reviews*. Here was his reply: "Its correspondent at Copenhagen, Mr. Gibbs, was perhaps the only journalist—there were some sixty of us—who was not present at the

famous catechising of Dr. Cook which took place at his hotel on the day he landed, when Mr. Walter, of the *London Times*, and myself were designated by our confrères of the international press to conduct the investigation, to which Dr. Cook submitted with the greatest good will, which, by the way, would not have been the case with all the men I know. In fact, this longanimity of Dr. Cook is one of his most pronounced characteristics, rendering his personality particularly agreeable and winning him many friends. His prompt and good-natured answers to our many and pointed questions were so straightforward and satisfactory that every one of us went away from the inquiry convinced of the *bona fides* of the man and of the explorer."

This opinion of Mr. Stead was not confined to the English-speaking correspondents at Copenhagen. At a reception at the American Minister's on my last day at the Danish capital, I met the brilliant staff correspondent of the *Paris Matin*, one of the leading French dailies, who said to me: "My paper telegraphed me to tell them what course they should pursue editorially in the matter of the trustworthiness of Dr. Cook. After due reflection, I unhesitatingly replied that, in my deliberate judgment, they should come out squarely for Dr. Cook; and this we have done."

Professor Georg Brandes, the distinguished Danish author, who had sat next to Dr. Cook at the American Minister's table the day before, said to me as we were sipping coffee in the Hotel d'Angleterre:

"I consider Dr. Cook a good, honest, sincere, but *maladroït* man. Could anybody have bungled more completely his affairs when he was here than he did if he wanted us to believe in his veracity? I doubt it. The first question I put to him was this: 'Why didn't you bring back with you your Eskimos?' He replied that they were afraid to leave home, because a year or two ago two Eskimos went to New York, where one died and the other disappeared. But he never imagined that anybody would doubt his word as to his having reached the Pole, and he informed us at the university festivity in his honor that

Sverdrup, the Norwegian explorer, with Knud Rasmussen, as interpreter, would go and get them. But there was no head nor tail to this statement, since the ship could not start till next May, he would have no authority over his Eskimos, it is not so sure that Knud Rasmussen would be at liberty to go to New York, as he has many other things to do here, and all this was to take place a year hence, when the whole thing would probably be forgotten! It is much the same muddle about his papers and his instruments, which he, of course, should have brought with him and never let leave his hands. But all this does not change the fact that he has, like Aladdin, found the treasure, and that Peary detests him like Nouredin, Peary, whose whole life has been one long effort to find what this lucky rival has found without much science, or, comparatively speaking, without much effort. But we must not overlook the fact that his feat was a brilliant one, and that he himself is the perfectly simple hero. These are not small things as the world goes today."

Tho I saw Dr. Cook three or four times while I was in Copenhagen, twice quite alone, I did not take the liberty of questioning him on the various points mentioned above, as my calls were for quite another purpose. But a friend of mine who did question him gave me this report of what he said. "This discovery of the North Pole," began Dr. Cook, "has been the dream of my life, a veritable possession. Is it probable, therefore, that I would fool myself, even if I were willing to fool the public, and only pretend to have done what I have been longing for years to do? Human beings are not built on those lines, at least not those born up in the Southern Tier." And this friend, a man of wide knowledge of the world, made this comment on the foregoing statement: "This very natural presentation of the matter is, to my mind, one of the strongest proofs of the honesty of Dr. Cook. He would not fool himself, even if he was willing to fool the public. When he made the above very philosophical remark in his quiet way, I was more convinced than ever that I had to do with a perfectly honest man."

Such are samples of remarks that I heard on every hand during my sojourn in Copenhagen. I might lengthen the list considerably. But whether it was a man of position and experience of the world who spoke, or a person of more humble origin, the opinion was much the same—everybody who talked with Dr. Cook came away prepossessed in his favor. And the impression which I myself received did not differ materially from that received by the many people whom I consulted on the subject. I recall particularly Dr. Cook's bearing and manner at the final reception at the American Minister's, to which I have already referred. I there studied the man carefully for an hour or so. I was especially struck by the fact that he was the most modest and retiring guest, male or female, in the whole room. He not only spoke in a low, quiet voice, but he scarcely spoke at all. At one moment I found myself in a little group consisting of Dr. Cook and two Danish scholars. Just as I came up, the conversation showed that a reference had been made to Dr. Cook's linguistic accomplishments, and I banteringly exclaimed: "But how is it, Doctor, that you have got possession of all these tongues, for up in our birthplace (Dr. Cook and I were born in inland counties 'up the State') there are not many chances to learn the languages?" Here was an opportunity for Dr. Cook to dilate before two learned men on his own intellectual accomplishments. In fact, to give him this opportunity was my real reason for "butting in." He simply smiled at the recollection of the linguistic possibilities of Sullivan and Seneca counties, and turned the conversation to meteorological conditions in the Polar climes.

At another moment at this same reception, Mr. Stead was holding forth with some vehemence on some favorite theme, and, for some reason or another, was gesturing with his legs, when he suddenly put his right one thru the Minister's pane of glass. There was a crash and the editor's trousers were badly rent at the knee. Everybody was excited by the noise except Dr. Egan and Dr. Cook, the first, out of natural Irish politeness, and the second because he had found that the leg was not cut. That

was the essential thing. "I must go back to London in this way," remarked Mr. Stead resignedly, for he was leaving for the station in a few hours, whither his luggage had already preceded him. "What of that?" put in one of those present, quite inappropriately; "Dr. Cook has got to go all the way to America with a bigger rent in him than that!" "Yes," chimed in very wittily a New York journalist, "but Stead's rent is made by glass and Dr. Cook's only by Peary!" Dr. Cook stood as tho he had heard none of the conversation, as tho he were fishing on the banks of the Delaware at Callicoon, and quietly remarked: "It's good you didn't get cut." This whole scene was typical of the man. Cool, not easy to take offense, grasping the important thing in a situation, and seeing nothing else.

There is another proof of Dr. Cook's *bona fides* in this Pole dispute which I have not seen mentioned. During my journey home, I ran over Dr. Cook's copy of "To the Top of the Continent," which appeared two or three years ago. In this account of this wonderful climb to the soaring peak of Mount McKinley you see a feat accomplished in exactly the same fashion as the famous "Dash to the Pole" described in the *Herald* articles and soon to appear in book form. This bold and stirring action reveals the same man, whom you follow step by step to "The Nail" of the Eskimos. In both instances the incentive is the same, simply a burning desire "to get there." The difficult ascent was also accomplished practically alone and the attainment was likewise questioned in some quarters. But no fair-minded reader of the volume can, I think, honestly doubt the accomplishment of the feat, and when you lay down the book you feel somehow that the author must have done all that he now claims to have done still further north and under somewhat more difficult circumstances, it may be. When the new book appears, I feel confident that it will do for the discoverer of the North Pole what this one did for the hardy climber of Mount McKinley—it will force even the most reluctant, if any then exist, to admit that in Dr. Cook the world has nothing to do with a colossal "faker," and Copen-

hagen's royal welcome, like that of New York, will not have been misplaced.

I may mention in closing still another proof of Dr. Cook's uprightness. Scarcely had he put foot on land, when he was assailed by a perfect deluge of tempting offers for this future book, which, by the way, he informs me is practically done, and can be handed to the printer by November 1. These came by telegraph, by letter and thru personal visits, and they poured in from all quarters of the globe and in various tongues. A leading Berlin publisher stood ready to give him 50,000 marks for the German rights in the two Teutonic Empires, while a well-known Danish firm proffered 20,000 crowns for the Scandinavian rights (Denmark, Sweden and Norway). These brilliant propositions seemed to bewilder Dr. Cook. He had already received a severe shock when he reached the Shetland Islands, where James Gordon Bennett telegraphed him to fix his own price for the telegram to the *Herald* which startled the whole world, and on which occasion he displayed "his marked unfitness for business," as a friend of mine who knows the value of things justly remarked. "One doesn't discover the North Pole every day in the week," remarked Mr. Stead in this connection; "Dr. Cook should have charged a round sum, say one thousand pounds, or five thousand dollars. Mr. Bennett would have paid that as quickly as he paid the inadequate three thousand dollars." A common friend of Dr. Cook and myself, Mr. E. G. Wyckoff, of Ithaca, who was at Copenhagen when Dr. Cook landed, says that "if it had not been for the intervention of friends, Dr. Cook would have practically given away all his publication rights, without a thought of money value." In fact, Mr. Wyckoff generously started off the next day on a tour to the Continental publishers in order to try and place the future book to the best advantage, while Dr. Cook, quite at sea in Copenhagen, adjourned all these fine proposals, saying: "Nothing will be arranged definitely until I get to New York." In a word, he did not feel equal to the occasion. He could discover the Pole, but he did not know how to sell a book recounting this discovery. A

man who thus lets thousands of dollars slip carelessly thru his fingers is not likely to be a party to a huge deception such as would be simply discovering the North Pole on paper.

In the early spring or the early summer—I now forget which—of 1886, Henry M. Stanley was in Paris, and one day I was a member of a little party of four who invited him to drive to Versailles to dinner. On our return late in the evening, one of the ladies asked the famous explorer if he had ever experienced stage fright. "Yes, on one occasion," was his reply; and then, after a pause, he continued: "It was after my return from Africa when I had discovered Livingstone. I had been invited by the Royal Geographical Society of England to give an account of the expedition. I was on the platform in the presence of an immense audience largely drawn there out of curiosity to hear my story. I was last on a list of distinguished speakers, some of whom, including the chairman, Lord Somebody, paid their respects to me in the course of their remarks and not always in a very complimentary fashion. Finally, I was boiling over with rage at these ill-timed and unkind aspersions on my veracity, and I began thinking out a suitable reply. But when my turn came and I was at length standing before this 'sea of up-turned faces,' my tongue clove to the roof of my mouth, and I could only utter: 'My Lord, Ladies and Gentlemen.' This formula I repeated three times, when my head began to reel. To prevent myself from falling, I quickly reached behind me and seized hold of the chair on which I had been sitting, which I placed firmly in front of me and leaned on the back for support. Then the whole speech which I had thought out and arranged on that chair suddenly came back to me." Thereupon Stanley rose in the victoria, and while we were driving thru one of the broad alleys of the Bois de Boulogne in the moonlight, he repeated to us the bold but well deserved rebuke, which he had spoken so many years before, when, with the hearty approval of the audience, he hurled back at their authors their insulting insinuations. This speech was the sensation of the week, and tho it

was much regretted among some of the young explorer's friends, nobody could deny that it was richly deserved. From that moment, none of those who were within sound of his voice doubted that the speaker had done what he claimed, and this opinion became universal when, soon afterward, "How I Discovered Livingstone" appeared as a book. To-day, nobody, of course, questions the remarkable feat.

During the past month, I have often been reminded of this treatment of this other great American (for in those days Stanley considered himself a fellow countryman of ours), by the Rawlinsons and the Kiepert of that time, by the reckless press and the thoughtless public, and I have more than once asked

myself whether, if Dr. Cook had displayed some of Stanley's fire and unpentup indignation, he might not have stopped more quickly these indecent aspersions on his truthfulness. But all men are not built on the same lines. Like the Wright brothers—another comparison quite to the point—Dr. Cook prefers to hold his tongue, keep his temper and let the cold facts tell the story, and it is not necessary to be a prophet to be able to predict that when Dr. Cook's forthcoming book appears, it will confound his hasty and ungentlemanly critics, as did Stanley's slashing speech at Edinboro and the volume which followed close upon it. Unless this proves to be the case, my experiences in Copenhagen have been mightily deceptive.

PARIS, FRANCE, SEPTEMBER 1, 1907.

The Parrot

BY GEORGE SYLVESTER VIERECK

O BIRD, grotesque and garrulous,
In green and scarlet liveried,
Thy ceaseless prattle hides from us,
The secret of thy dream indeed.
But in thine eyeball's mystic bead
Are mirrored clear to them that read
Vague, nameless longings like the breed
Of some exotic incubus.

Where is thy vision? Overseas?
In some bright, tropic far-off land
Where chiding simians in tall trees
Swing, by luxurious breezes fanned,
While at fantastic savage feasts
Brown women uncouth idols hail,
And thru the forest sounds the wail
Of the fierce matings of wild beasts?

Or are thine other memories,
Of other lives on other trees,
Encasements in some previous flesh
In far-off lost existences?
For as the tiger leaves his spoor
Upon the prairie, firm and sure
Life writes itself upon the brain.
The soul keeps count of loss and gain;
And in the vibrant, living cells
Of thy small parrot's brain there dwells
A sparkle of the flame benign
That makes the human mind divine.

The self-same Life Force fashions us:—
He writes on thy skin on high,

Its transient mansions thou as I.
Thru Plato's mouth it speaks to us,
Thru the earth's vermin even thus.
The heaving of a baby's breast
And the gyrations of the sun
To its omnipotence are one
And make its meaning manifest.

We are both wanderers of time
Who risen from the primal slime
When God blew life into the dust,
Press to some distant goal sublime.
And often thru the thin soul crust
Rush memories of an alien clime,
Of gorgeous revels more robust
Than any dream of hate or lust
In the gilt cage upon us thrust,
And visions strange beyond all rime.

The Life Force with itself at war
Molds and remolds us, blood and brain,
Yet cannot quench us out again,
And after every change we *are*.
The soul-spark in all sentient things
Illumes the night of death and brings
Remembered, immortality.
Time cannot take thy soul from thee!
All living things are one by kind,
Heritors of the cosmic mind.
Thus deemed the prophet on whose knee
The kitten slumbered peacefully,
And surely good Saint Francis, he
Who as his sister loved the hind.

—New York City.

Literature

The New York of Today

MANHATTAN ISLAND, altho comparatively only a small part of the greater city into which "little old New York" has so rapidly and enormously expanded, is still the real New York; the four other boroughs now comprised in the American metropolis are only its dormitories, and here and there the scene and space of the overflow of its energy, its ceaseless activities of both work and play. And so it is not surprising to find Professor Van Dyke and Mr. Pennell devoting themselves almost exclusively to the description of Manhattan Borough in the attractive and engaging volume of their joint production entitled *The New New York*.* Specifically, only one of its twenty-five chapters, and that next

to the last in the book, deals with "the larger city"; and less than a dozen out of Mr. Pennell's 124 drawings took him away from Manhattan. And surely this wonderful island—the nucleus, the backbone and at the same time the heart and brain, of the most wonderful and the most picturesque city of the modern world—has never before been described so completely, so vividly and so volubly. Yet, despite the vastness of it all, and the rather sprawling aspect of Greater New York, with its "waterways, landways, bridgeways, railways, radiating and crossing, leading outward and onward," the city is coming to be a real entity, a homogeneous unit; and there is tacit recognition of that fact, a sort of undercurrent of feeling that it must inevitably be so, all thru Professor Van Dyke's book. By way of preface he says:

*THE NEW NEW YORK. A Commentary on the Place and the People. By John C. Van Dyke. Illustrated by Joseph Pennell. New York: The Macmillan Company. \$3.50 net.

"The writer and the illustrator have not es-

LOWER CITY IN MIST
From Van Dyke's "New York" (Macmillan)

caped the embarrassment of many points of view, but gradually the belief has come to them that, pictorially, the larger aspect of New York is the life and energy of its people projected upon the background of its commerce. It is this character of the place and its inhabitants that they have sought to set forth, convinced that character is interesting in itself, and that true municipal beauty must be more or less beholden to it. Those who believe only in the planned and plotted city will, no doubt, shake their heads over this; but many times in civic story the characteristic has proved more attractive than the formal. It has been demonstrated in the present day, here in New York. Those who have erected the new city, as need has dictated, have builded better than they knew. They have given us, not the classic, but the picturesque—a later and perhaps a more interesting development."

In upholding that contention the author has left untouched few phases of the city and its teeming life. Beginning with "The Approach from the Sea," he takes up in turn the downtown financial district, Broadway, ancient landmarks, Fifth avenue, shops and shopping, New York by night, homes and houses, the Bowery, the tenement dwellers, bridges, parks, municipal art, and many other things. He has a good word for the skyscrapers:

"Everywhere they are safe, serviceable, absolutely necessary buildings; and it may be added that eventually people will find them not wanting in beauty."

He enjoys and marvels at the late afternoon Fifth avenue throng. He feels the spell of the "Great White Way":

"The electric signs show everywhere, and, tho one wearies unto death with what they say, the light of them helps on the general illumination and is rather attractive than otherwise. Letterings, patternings, arabesques, figures of birds and beasts and men, are outlined by small electric globes, and the whole thrust upon the night in giant proportions. . . . All told, the glitter and glare of these signs make up a bewildering and (it may be admitted) a brilliant sight."

It may be seen that Professor Van Dyke is a kindly observer; perhaps at times a trifle too apologetic in tone over such things as he finds here to admire; but his criticisms are perfectly sound and just. Worthy of the most careful consideration are his suggestions for bettering the East Side slums by excluding the criminal, vagrant and pauper classes (if not by further restriction of immigration, then by imposing an admission fee, or suitable tax, that would prohibit the worthless element from

entering), by more stringent health regulations as to the number of people any given space should house, by compelling the same class already here to work on the public streets—in short, by sympathizing with the city rather than with those who would ruin it. He knows his New York and seldom mistakes in description or fact, but it would have been easy enough for him to find out that the old mills in Van Cortlandt Park were destroyed by fire more than a decade ago. It would seem to have been possible also to modify in the proof sheets a note of fulsome praise of Mayor McClellan in the otherwise deservedly laudatory chapter on "City Guardians." "Honor to General Bingham, who is credited with implanting this new spirit (of precision, accuracy, obedience) in the police! And honor again to the Mayor, who, in spite of party pressure and partisan virulence, has resolutely sustained the Commissioner of Police in his office and in his work," was written, of course, before the Mayor's craven removal of General Bingham from office; after that catastrophe it sounds ridiculous. But these are almost negligible blemishes in an extremely interesting and entertaining book.

Mr. Pennell's pictures, regrettably, are not on a par with the text. They are disappointing. Even the pastel drawings reproduced in colors somehow lack the delicacy of touch we have been accustomed to find in this artist's work. They, no doubt, have suffered in the process of reproduction, but evidences of careless haste abound. The crudely sketchy impressions in black and white are many of them so slipshod as to belie the true aspect of the street or the building portrayed.

✽

Italian Travel

THAT professional traveler and travel writer, Mr. Francis Miltoun, adds to the growing list of his books one on *Italian Highways and Byways from a Motor Car*, a sizable and informing volume, that, as is but natural in a book of automobile travel, covers a great deal of

ITALIAN HIGHWAYS AND BYWAYS FROM A MOTOR CAR. By Francis Miltoun. With Illustrations by Blanche McManus. Boston: L. C. Page & Co. 8vo. 16.50. \$3.00.

ground very rapidly, all parts of the kingdom being represented. It is not the first time this writer points out to us that the motor car offers facilities for departing from the beaten track, and re-discovering localities deserted by the traveler since the days of the stage coach and the grand tour. Italian roads are not so good as those of the rest of Continental Europe, he informs us, always

Mr. Miltoun rhapsodizes at inordinate length about the country's historic and artistic interest in his introductory chapter, nor does he fail to give his readers snatches of these cultural associations in his later pages, after the manner of the conscientious guide. The information is of necessity fragmentary and unrelated, but there is the whole winter in which to trace continuity and connections—to

DEMETER'S WELL-BELOVED CHILDREN
From Bisland and Hoyt's "Seekers in Sicily." (Lancet)

barring Spain; garage facilities are uncertain, gasoline is dear, but, notwithstanding these drawbacks, the trip is eminently worth while. In fact, there are many trips for many summers in this book. There is much sage advice about hotels, especially in the small places—in short, it will prove of real service to the automobilist planning next summer's tour.

Blessed be Italian history, there is so much of it, and all of it is so interesting.

"read up." It all has a somewhat rushed, sixty-miles-an-hour effect, but he who follows Mr. Miltoun's itinerary will, of course, do as he undoubtedly has done, stop wherever he lists, to expand the brief note of the book again into the paragraph, the page, the chapter of leisurely travel from which it has evidently been condensed. It is almost needless to add that the colored and other pictures are by Blanche McManus.

Even more breathless is the pace of

Elizabeth Bisland and Anne Hoyt's *Seekers in Sicily*²—not the pace of actual physical travel, but of incessant historic and prehistoric interest, of recollection and allusion ranging all the way from Phœnician and Greek, thru Roman times, to the period of Saracen conquest and Norman supremacy, with a decided preference for Greek antiquity and mythology, for Pan, Persephone and the Idylls, and a romantic *penchant*—as becomes two feminine enthusiasts—for Roger de Hauteville. One is reminded a little of the hot-house erudition of the woman's college, one sympathizes with "Jane" when she informs "Peripatetica" that she is "suffering from an indigestion of history," and is going away from there, or words to that effect, but the book is worth reading, nevertheless, provided that one does not attempt to read too much of it at one sitting: thus will the cultural "indigestion" be forestalled.

Sicily and the Sicilians of the present are sketched in with a clever pen, but one wonders a little at the toplofty attitude of these two travelers from the "States" toward their fellow *forestieri* in Sicily—English, Polish, Austrian, German—especially German. We who have not yet altogether outgrown our sensitive habit of resenting foreign brickbats should not set the example by being quite so free with stones of our own. Besides a number of illustrations, the volume contains a series of curious chapter headings, reproducing the tribe signs or totems of the aboriginal inhabitants of the island, which are still considered as talismans and defenders against that direst of all Italian dangers, the Evil Eye.

Mr. Monroe's *Sicily* is a more sober and sympathetic account of the island, and seems to touch upon everything from the voyage of Ulysses to the earthquake at Messina, finally adding a annotated list of other books about Sicily in four languages. He recommends winter as the best time for a tour of the island and

discourages walking, cycling and automobiling on account of bad roads and bandits. An unusual feature of the work is the attention given to recent Sicilian writers, musicians and artists about whom most of us know nothing. Like most of the Page books it is handsomely illustrated, there being fifty full page half-tones of people and places.

And now for a restful summer of dreamy enthusiasm in an Englishman's book, Mr. Edward Hutton's *In Unknown Tuscany*.³ He does not drag the dead, romantic past into the bustling, rushing present; he drifts back to it. He is not pressed for time—no "return ticket" gives him its daily more urgent warning. He sees, he feels, he surrenders to Nature, who does not age, beautiful today as she was when Italy set about creating her wondrously variegated historic human background.

The Score

THIS book* is made up of two remarkable stories very different in material, but similar in theme. The theme is put forward on the title page in the form of a challenge. "For and against—how stands the score?" The author has depicted crucial moments in the lives of two persons brought before the eternal judgment bar of their consciences.

The scene of the first story, entitled "Out in the Open," is fixed at a watering place in modern England. The characters are a middle-aged "battered butterfly" playwright; his leading lady, whom he has come to consult concerning changes in his latest play, and a young, rawboned politician, full of his recent successes, who dashes upon the scene to bear away the lady in a British Lechivar style. The situation is simple, but the characters complex. Anthony Hammond, the playwright, as seen in the prim, sleek words of the author's characterization, appears at first to be nothing more than an egotistic fool trying to take life *à la carte*. But gradually a certain twinkling quality of his mind to appreciate his own absurdity and mince

¹SEEKERS IN SICILY, Elizabeth Bisland and Anne Hoyt. The Independent, 1915. The Publishers, 1915. 100 pp. 10c. New York: The Century Co., 1915. \$1.00. (1915.)

⁴THE SCORE, by W. Somerset Maugham. New York: E. P. Dutton & Co. \$1.00.

out of it becomes perceptible, and soon we laugh with him as much as at him. Lucius Denier, the politician and lover, with his very red blood, dominant physique and square-jawed mind, is essentially brutal save for intermittent and softening streaks of boyishness. Neither of the men in the course of nature is complex of himself. They grow so trying to understand the tangled mental processes of our old acquaintance, Poppy St. John, the third line in this irregular triangle. She is young only because she is beautiful, and lilting in spirit. In the past she has had more experience than virtue. But now, in the full bloom of her life, whatever society may say, she has freed herself bodily and mentally from any clinging garments of passion and purged herself with the hyssop of hard work. It is only when Denier rushes forward with an ardent proposal of marriage that the dead she has buried within her fling off their grave clothes and settle to a mortal combat with virtue, which dictates that "damaged goods" has no right to wifedom and motherhood, no matter what penance has been done. The battle is grave, even tragic, in its progress, but her whimsical common sense saves it from hysteria.

The scene of the second story, entitled "Miserere Nobis," is laid in a hospital in Florence. The chief character is a young Italian mortally wounded by his own hand, who is attended by a father confessor. In the background there is a group of praying Catholic sisters, and on a nearby bed a cursing Neapolitan conscript. The atmosphere is electrical and the danger of melodrama imminent, but the author manages it so that we see and hear only the lad who is giving his dying confession. He represents youth caught in the octopus-toils of fate, made a criminal not thru any agency of his own nature, but thru a twisted sense of right which an evil man has used to further his own revenge. By a long line of intrigue the boy has been forced unwittingly to murder his own father, whom he has been induced to believe was his mother's lover. When he discovers the truth he becomes mad with the horror of it. Such has been the poetic sensitiveness of his mind, the

whole horizon of life is reddened by a bloody blight, and his imprisoned innocence seeks some line of escape. It finds this in the blood-atonement which he makes. As he gives his confession, which is damning not to himself, but to man-made revenge, the unsullied shine of youth comes back, and somehow out of all the curse of his crime and the pain of his body his spirit rises dominant over the evils which life has sought to cast upon him.

Lucas Malet is a dramatist and a preacher. She is a dramatist in two senses—she has an eye for stage effects and for dramatic "lifts." Her scenery is carefully shifted to support the moods of her actors. Sometimes she has charming frills to her descriptions that tickle one's imagination and humor with their tiny completeness. Sometimes she uses great words that hurtle across the page, sweeping and darkening the skyline of action. At no time does she leave her people without surroundings made to fit them. But nothing would save the book from being more than a brilliant monolog if it were not for the "lifts." The action of the play is in the main potential, but suddenly there come whirlwinds of violent movement that leave the reader anxious to rest until the next storm. However, Lucas Malet is important to us now as a preacher. She is representative of a sort of predestinarian morality that comes like writing on the Babylonish walls of present day fiction. She has taken as her text, "Tho He hold his hand and seem to forget, yet, in the end and by ways they least look for, He will have from every man the full price of his sinning." The score is, after all, reckoned by God and not by man.

Love Letters of Famous Poets and Novelists. Selected by David Strecher and prefaced by Walter Latham. New York: The John McBride Company. \$2.

This book is a collection of love letters from seventeen well-known writers of fiction and poetry. Each set of letters is prefaced by a short biography of the correspondents, which, altho too general at times to give an exact idea of the true situation, succeeds in furnishing the reader with a comparatively correct im-

pression of the persons concerned. The letters themselves have the quality of most letters of their kind. They charm us and yet slightly mar any intellectual picture we may have had of these great men. Few of them succeed in tiding their love affairs with dignity, rarely with attention to the moral laws of society. Scott and Keats appear to have been the only ones that conducted their romances with propriety—the former because he cared for the conventions, the latter possibly because he was too ill and sensitive to do otherwise. Some of the letters are bare and gross, others ridiculous, as that of Bulwer Lytton, in which he addresses his love as "My Dearest and Darlingest and Angelest Poodle," and

goes on to bestow a thousand kisses upon the poodle named Rosina. On the other hand, the selections from Victor Hugo, Heine, Keats and George Sand abound in passages of exquisite tenderness and fine emotionalism. Reviewing the work as a whole, however, it seems a little unfortunate that we should have to know so many of the shortcomings and infelicities of these literary lovers.

A Handbook of Modern French Painting.

By D. Cady Foster. New York: Dodd, Mead & Co. \$2.00.

A handbook we expect to be dry; in fact, have come to believe that it must necessarily be so, on account of the necessity of including a large number of

GERÔME'S PAINTING OF THE MARTYRDOM OF ST. DENIS.
From Foster's "Handbook of Modern French Painting" (Dodd, Mead & Co.).

names, dates and details. But this handbook by the Professor of the History and Criticism of Art in Yale University is an enjoyable exception to this rule. Altho he gives biographical sketches of two hundred artists in 360 pages, he finds room for at least a few words of criticism or characterization on the work of each one of them. His comments are not of the customary guide book character, but have a personal touch that make them interesting, however brief. The following remark, for example, in regard to Bonnat's picture of the martyrdom of St. Denis, in the Pantheon, does not, we believe, occur in Baedeker or the encyclopedists:

"Nothing of an extraordinary nature occurred at the execution of these minor saints; but when Saint Denis's head was lopped off, he grabbed it with his hands and marched back with it to the site of his present cathedral. The further statement that to cross the river Seine he took his head in his teeth and swam over is an addition of a later day and not worthy of credence."

In another respect Professor Eaton violates the conventionalities; he talks about the pictures in the book (there are two hundred and fifty of them), whereas it is customary for art critics to pay no attention to their illustrations, but to discuss some other works of the artist, which the reader has no chance to see.

The Struggle for Imperial Unity. Recollections and Experiences. By Colonel George T. Denison. New York: The Macmillan Company. Pp. x, 422. \$2.25.

During the reign of the late Queen Victoria, Colonel Denison was long widely advertised in Ontario as "Her Majesty's most loyal colonial-born subject." This was indeed a remarkable distinction; for in the later years of her reign Queen Victoria must have had not less than four or five million subjects born in Canada, Australasia and South Africa. How Colonel Denison, who, by the way, is a stipendiary magistrate at Toronto, came by his distinction is now made plain to all the world; for *The Struggle for Imperial Unity* is chiefly the story of his persistent and valorous endeavors to prevent the gobbling up of Canada by the United States. Colonel Denison's military career dates from 1855, when he became cornet in the Gov-

ernor General's body guard; and since about 1871, when he began a propaganda to develop a national spirit in Canada, he has apparently been losing much sleep at night from an apprehension that the United States had sinister designs on the integrity of Canada. At no time has Colonel Denison been able to convince even a cornet's guard of his fellow Ontarians that this danger was really at hand. Colonel Denison describes in detail an academic discussion which took place as far back as 1883 or 1884 at the National Club, of Toronto. Mr. Goldwin Smith was in the chair, and according to Colonel Denison's own showing not more than fifteen or twenty members of the club were at the dinner. When it came his turn, he writes:

"I simply said that I could not argue in favor of either independence or annexation; that I was vehemently opposed to both; and that if ever the time came that either should have to be seriously discussed I would only argue one way, and that was on horseback with my sword. As I then commanded the cavalry in Toronto [Colonel Denison omits to state what the numbers of the cavalry were—whether they were twenty or twenty-five all told] and had sworn to bear true allegiance to Her Majesty, it was the natural way for me to put it."

There is much more of this comic opera colonel sentiment in Colonel Denison's four hundred pages, especially when he is concerned with the movement for commercial union of 1888-90, with the Bering Sea arbitration, or with any discussion of Goldwin Smith's utterances as to the future of Canada. He has long regarded Mr. Smith as a traitor—long regarded his views as treason of the worst kind. He writes:

"Such persistent hostility to the national life in any other country would not be tolerated for an instant. In Russia under like circumstances Goldwin Smith would long since have been consigned to the mines of Siberia. In Germany or Austria he would have been imprisoned. In France he would have been consigned to the same convict settlement as the traitor Dreyfus; while in the United States he would long since have been lynched."

It is an unneighborly book both as regards Colonel Denison's fellow-Canadians and also as regards the United States. It is a book that would surely never have been published had Colonel Denison spent six months in this country and realized how utterly indifferent are the people of the United States to the

politics of Canada. Except when tariff legislation is pending either at Washington or Ottawa, the newspapers of New York today give little more attention to the internal affairs of Canada than they do to those of Natal or New Zealand; and this in spite of the fact that it is the acknowledged aim of most daily newspapers to give the public what it demands in the way of news. In the Imperial Federation movement in Canada of 1885-1893 Colonel Denison had Mr. George R. Parkin as one of his most zealous colleagues. Mr. Parkin, like Colonel Denison, has written a book; and it is to be regretted that Mr. Parkin's neighborly spirit, as expressed in his "Great Dominion" has not actuated Colonel Denison in writing *The Struggle for Imperial Unity*. Mr. Parkin describes Canada as leading her own life, "but," he adds, "while living its own life the Dominion grows more cordial with its great neighbor as the latter learns to respect it."

Irene of the Mountains. By George Cary Eggleston. Boston: Lothrop, Lee & Shepherd Co. \$1.50.

One is reminded of Tennyson's poem about the little brook when one takes up Mr. Eggleston's latest "Romance of Old Virginia." There is no essential difference between it and the unnumbered ones of the past save for a new pink sash of politics. But then, politics has always been so fashionable the author could not be accused of an innovation even here. Irene, a young mountain girl of unusual beauty and mind, is discovered by a benevolent gentleman who later becomes Governor of Virginia, and is brought by him to his home and reared there. Tom Hardaway, a young man of old and honored lineage, falls in love with Irene and marries her in spite of all protestations from his mother, who is a great respecter of family. Mr. Eggleston's romances are less harmful than the "Elsie Books" and give more useful information. The fact is he mutilates the story and the reader's respect for his own intelligence with an unnecessary glossary of manners and customs, and successfully expurgates all local color from his book by a profuse use of quotation marks. Mr. Eggleston, with his heroes and heroines,

and, of course, a chaperon, ought to be retired to an old Virginia plantation and kept there, pensioned by his readers.

The Works of Victor Hugo. Handy Library Edition. Boston: Little, Brown & Co. 22 vols. \$1.00 each.

From the specimen volumes before us the present edition of Hugo would seem to be what may be called a publisher's rather than an editor's edition, got together in the first instance for the convenience of English readers more curious than scholarly. In the case of "Napoleon the Little," for instance, there seems to be no one to take responsibility for the translation; at least, no translator's name is given, while the "Poems" are made up of translations by various hands, including Swinburne's well-known rendering of *Prenez garde à ce petit être*. At the same time the first lines of the poems are given in the original, so as to make identification possible. The volumes, too, are all well printed and of comfortable proportions. And the edition as a whole is a very presentable one of its kind.

Recent Christian Progress. Studies in Christian thought and work during the last seventy-five years. By Professors and Alumni of Hartford Theological Seminary, in celebration of its seventy-fifth anniversary, May 24-26, 1909. Edited by Lewis Bayles Paton. 12mo., pp. 597. New York: The Macmillan Co. \$3.

This is a most comprehensive book. It contains over eighty short essays averaging scarce eight pages each, in which the writer attempts to tell as succinctly as possible the progress of three-quarters of a century. Of course the treatment must be very fragmentary on such subjects as "Oriental Archeology," "Higher Criticism," "Apologetics," "The Doctrine of God," "Religious Literature," and "Theory and Method of Foreign Missions." The commendable purpose has been simply to instruct the reader as to the direction to which a student must look for further information, to show drifts, and to illustrate the productive scholarship of the graduates of Hartford Seminary. As the essays cover the whole theological and religious field there is something for all tastes, and we commend it as a comprehensive sort of encyclopedia, in which the reader can trust his informants.

The Columbia River. Its History, Its Myths, Its Scenery, Its Commerce. By William Denison Lyman. Illustrated. New York: G. P. Putnam's Sons. \$3.50.

This is a book rich in illustration and in verbal description. All the wonders of the wonderful land drained by the Columbia are related, and many of them are pictured. The historical parts, tho brief, are well narrated, and a due sense of proportion between great things and small is observed. A wealth of material has been gathered, and it is on the whole carefully used, tho an occasional slip is to be noted. There is one on page 70, which credits Verendrye with setting forth from Montreal in 1773 and reaching the vicinity of the site of Helena.

give to men of other regions a new sense of the commercial importance of this wonderland. It is in all respects an excellent book.

✱

Hellas and Hesperia, or the Vitality of Greek Studies in America. Three Lectures. By Basil Lamman Gildersleeve. 16mo. pp. 130. New York: Henry Holt & Co. \$1.

We don't care what Professor Gildersleeve writes about, or whether he sticks to his subject. We would follow him, tho his course be as scoliodromic as the track of a rabbit in the morning dew. But every turn is to nibble a flower; flowers of rhetoric, he tells us, not flow-

ILLUSTRATION FROM LYMAN'S "THE COLUMBIA RIVER" (PUTNAM'S)

It was not Verendrye, the great explorer, who made this journey, but two of his sons, François and Pierre; the start was not made from Montreal, and the date was 1742-43. Such slips, however, are not common. Much space is given to the commerce and general development of the Columbia River country, and the data make an impressive showing for the region. That a million and a quarter persons live within the American part of the Columbia watershed; that this section yields annually seventy million bushels of grain, three billion feet of lumber, sixty million dollars' worth of minerals and fifty million dollars' worth of other products, will

ers of sulphur. He is a Greek to his dactyl-tips, but he can quote Kipling, and Mark Twain, and Max O'Rell as easily as Plato and Herodas. The purpose of these three lectures before the students of the University of Virginia is to show the vitality of Greek literature, and particularly the likeness of the Greek and the American genius. The subject is attractive, but the treatment would still be sparkling if he were discussing the Greek itacism, no less than the witticisms of Aristophanes, which, he remarks, have to be interpreted at length by a German commentator, but which give no difficulty to an American reader.

Literary Notes

....The most attractive feature of *Americana*, the successor of the *American Historical Magazine*, is its illustrations, old and new. An official history of the Mormon Church is running in it as a serial. (Pub. by National Americana Society, New York).

....The Library of Congress in a 241-page want list of American periodicals recently issued shows that it lacks copies of THE INDEPENDENT for July 18, August 29, September 5 and October 10, 1867 (Vol. 19). Also the title page and index to 1899-1900 (Vols. 51-52). Any subscribers who can supply these missing copies would be doing the Library of Congress a great service.

....One of the best works called forth by the recent Calvin centennial is a collection of Calvin's characteristic and historical letters by Rudolf Schwarz, with introduction by Prof. Paul Wernle, in two volumes, published by J. C. B. Mohr, of Tübingen. It is entitled *Johannes Calvin's Lebenswerk in Seinen Briefen*. Volume I contains letters down to 1553, and Volume II to 1564. These are books for students of church history.

....The International Bureau of American Republics at Washington has issued a handbook of *Chile*, packed with information and statistics concerning the country's geography, topography, etc., its area and population, climate, flora and fauna, mineral resources, agriculture, industries, commerce, means of communication, finance and banking, land and mining laws, custom house tariff, government and constitution, army and navy, the rights of foreigners, educational institutions, etc., etc. The United States still remains in third place so far as the imports of the South American republic are concerned, the figures for 1907 being as follows: England, \$41,428,409; Germany, \$27,123,091; United States, \$11,360,400. In the same year Chile sold to England \$50,978,411 worth of its products, to Germany \$20,373,941, and to the United States \$7,091,187 worth.

....The *American Jewish Year Book* for the year 5670, according to the Jewish reckoning, has just been issued for the beginning of that year at sundown of September 15, 1909. It is edited by Dr. Herbert Friedenwald, secretary of the American-Jewish Committee, and is published by the Jewish Publication Society of America (Philadelphia). Its leading article is "The Passport Question in Congress," dealing with efforts to obtain the recognition, by the Russian Government, of passports issued to American-Jewish citizens by the American Government. The review of the year 5669 by Albert M. Friedenberg deals with immigration, the Bible in public schools, Sunday laws, and philanthropic, educational, social, political and religious matters in which Jews are interested. There is an account of the recently organized "Jewish Community" of New York City, whose aim is to represent the Jews of New York wherever it may be deemed necessary to act as a unit. The remainder of the book is the usual yearly record of events of all sorts referring to Jews and Jewish work.

Why not select baseball teams composed of those disposed to give Cook first credit and those who believe the laurels are all Peary's, and play it off?—*New York Evening Mail*.

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - New York

A WEEKLY MAGAZINE. FOUNDED IN 1848.

One Year, \$2.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, \$1.75 a year extra; to Canada, \$1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with \$1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

Successes and Failures of the Celebration

THE most conspicuous of the successes was the weather; which was just right, sunny in the days and clear in the nights, neither too warm nor too cool. We New Yorkers feel proud of that, for we did better than we promised. Nearly every morning the upper right hand corner of the newspapers dampened the enthusiasm of millions by foretelling rain, but it did not come, or if it did it came at such a time as to avoid interfering with the parades, just enough to lay the dust and to wash the dirt and some of the orange and blue off of the decorations.

The chief lesson of the week is the demonstration of the superiority of water pageantry over land and of military over civilian. Henry Hudson and Robert Fulton, and their crews and crafts, played their parts to perfection, except that the "Half Moon," in starting out, overleaped two centuries and collided with the "Clermont," nearly smashing one of her precious paddle-wheels. The long line of warships of many nations, stretching up the Hudson from Forty-fourth street to Spuyten Duyvil, was interesting by day and fascinating by night.

The terraces of Riverside Drive on one side and the Palisades on the other gave ample space for two million spectators. The civilian part of the marine parade, the three squadrons of yachts, motor boats and tugs, failed to materialize. Of the street pageants the military parade was by far the best managed, prompt, imposing and extensive.

That the chief features of the celebration should have been the display of armament is unfortunate, for the events commemorated were the victories of peace. The "Half Moon" was not commissioned by the Dutch navy, but by a trading company, and the application of steam to navigation was chiefly for the benefit of commerce. But if we had not had the help of the army and navy on this occasion we should have been badly off, for we are obliged to confess that the historical pageant was a fake.

If a one-ring circus invaded a country town with chariots of such crude and inartistic construction as some of these floats it would be likely to be mobbed. The committee which had this part of the affair in charge seem to have been totally ignorant of the great progress that has been made in the art of pageantry in the last three years. The historical parade was about as instructive and consistent as a comic opera, nearly as funny, but not half so pretty. Instead of some fairly correct representations of historic scenes, these were for the most part grotesque pyramids of *papier maché*, coarsely painted, and adorned with ill-disguised men and women, chaffing, flirting and chewing gum. The commission announced its intention to depict important scenes in four periods—Indian, Dutch, Colonial or English, and American—in order "to give an impetus to historical research and to present historic scenes so they will impress themselves more clearly on the minds of the spectators than could be done by books and pictures." To this end the city spent \$250,000 and more than 300 men were employed for months in the preparation of the floats. It was money and time wasted so far as the announced object is concerned, for any ideas of history obtained by the populace from this parade would be apt to be of less value than none. Among the facts impress upon the minds of the innocent

spectators were that Croton water was introduced into New York before Peter Minuit bought Manhattan Island; that Henry Hudson discovered the river some time after he perished miserably in Hudson Bay; that Washington delivered his farewell address after the Erie Canal was opened; and that Peter Stuyvesant lived before Hiawatha. No attention was paid to chronological order, but titles without floats, floats without titles, and floats with the wrong titles were all jumbled up together. This might have been excused on the first day, but when the parade was repeated in the Bronx, on Staten Island and in Brooklyn, it grew worse, and showed that it was a clear case of incompetence. Only nineteen of the fifty-four floats got to Brooklyn, and these fell into line in chance order, manned by any of the masqueraders — Indians, Dutchmen, Colonials and Americans, who happened to board them. The carnival parade in the evening was less objectionable, partly because nobody expects accuracy or consistency in myth and legend, partly because the failure of the plans for lighting the floats in part concealed their absurdities. Still, the titles could be read and conveyed some misinformation, such as the "Queen of Sheeba," "The Origen of Poety," and "Walkure." Altogether, the processional feature of the celebration was a carnival of bad history, bad spelling, bad taste and bad management.

The most wonderful and beautiful thing seen in New York last week was the fireless fireworks on the bank of the Hudson. These were produced by turning a large battery of strong searchlights on a row of pillars of steam, and on the clouds made by smoke-bombs bursting in air. They looked like great ostrich plumes of all colors, always moving, changing, vibrating, growing and vanishing, a rhythmic kaleidoscope, an artificial aurora borealis, a sunset set to music. It seems that here we have a new spectacular art of undeterminable possibilities. Instead of the few crude colors of pyrotechnics, the simple and familiar combinations of barium, strontium, magnesium and iron, we have an infinite number of tints and blends, strong or delicate, lasting or evanescent, and capable of being played in chords or monotone as easily as a musician plays

the piano. Such a display is visible from all sides and freely enjoyable by unlimited numbers at a time. Miles away one could see the beams of the searchlights, looking like a gigantic fan opening and closing or long white fingers groping among the stars.

But most of all are we proud of the American crowd. It was good natured, well dressed and well behaved. The police managed skillfully on the whole but in general it kept itself in order. A million or more of men, women and children were gathered and dispersed, fed and lodged, with few accidents and no serious disturbances, day after day, all having had an opportunity to see the show without regard to their wealth or social position. Since the people played the largest part in this celebration we are glad to commend their acting.

The New York Campaign

WITH the nomination last week of the Tammany and Fusion tickets the New York municipal campaign opens full blast. The Hearst Independence League left the fusion forces at the eleventh hour when it became evident that their "squalid scramble for the offices" would not be successful, and unless they can induce Mr. Hearst to run himself they will probably amount to nothing in the campaign.

The fusion nominees for the Board of Estimate and Apportionment (the real governing body of the city) are unquestionably the best that have ever been selected for the offices. Their election would insure an administration every principal and subordinate office of which would be directed by men of probity and intelligence. Mr. Bannard, the fusion mayoralty candidate, is one of Yale's best-beloved graduates and has long been prominent in the philanthropic and financial affairs of the city. He is known as an adept organizer and executive, and will be especially qualified, therefore, to deal with the city's financial tangles. He enters the campaign, however, handicapped by being the president of a trust company and director of many public service corporations. Corporate affiliations are not at the present moment political assets.

Judge Gaynor, on the other hand, is

supported by a mediocre Board of Estimate and Apportionment, and is a man of uncertain timbre. While few believe if elected Mayor he would wear the collar of Tammany Hall, yet he is known to be erratic, dictatorial and overbearing, and is, as Mr. Jerome says, a political judge. He is a lover of politics, which a judge ought not to be. The lawyers do not love him. He is able, industrious and wilful. He is not charged with dishonesty. He has had a way of seeming worthy of nomination and then failing. At the last Democratic National Convention he was most prominently named in advance for Vice-President, but when it came to nominations his name was not heard. Again, at the last Gubernatorial election in this State he was the favorite of a large element in the Democratic party, but at the hour for nomination he slipped out of sight. At last the chance has come to him as mayor, and we wait to see how he will take with the voters. An extraordinary reason for his failure hitherto is given by Father Cantwell in *The Monitor*, and is quoted in other Catholic journals. He says that in his youth Judge Gaynor was a devout Catholic. We may add that he was a member of the order of Christian Brothers, and taught a year in Boston in their schools; but, says *The Monitor*, "he fell away from his original fervor, possibly not thru conviction, but thru some marriage complications." He was married against the law of his Church. This marriage, says Father Cantwell, "took away, unless repudiated, all possibility of leading a Catholic life, and has estranged him from the Church of his birth." This is suggested as the reason why political prudence has impelled leaders to pass his name by when mentioned for an elective trust, notwithstanding his great ability and unquestioned integrity and independence:

"There is a very large Catholic population in New York City. Catholics are peculiarly loyal to their Church. Would the nomination of Judge Gaynor alienate the Catholic voters? Would they trust a man in civil life who had been false to all they hold dear in religion?" It seems that at last that spell has been broken and that his former co-religionists will vote for him. He stands a very fair chance to be elected, and if we can judge from the way he sent McKane and

half a dozen other Democrats to prison for ballot frauds years ago, Tammany will regret that it is compelled this year to put in nomination one who has earned the reputation for being an honest and fearless man.

Judge Gaynor's great appeal will be that he is a radical; he will fight the so-called "traction thieves." It will come out during the campaign, however, that Mr. Bannard is likewise progressive on the traction issue. Indeed, his success will be certain if he can make this clear to the people.

Neither Tammany nor the Fusion forces have renominated District Attorney Jerome, who will run on an independent ticket. Whatever difference of opinion there may be as to Mr. Jerome's sincerity (there is none, of course, as to his ability) it is a fact that in all these years of corporate exposures which have literally stunk to heaven, he has not convicted a single "man higher up." It is a sad spectacle of a great man not great enough to seize his opportunities.

Centennial of the Disciples of Christ

THE Disciples of Christ hold their centennial celebration next week. The date, October 11-17, 1909, is taken from the publication of "A Declaration and Address," by Thomas Campbell, father of Alexander Campbell, September 7, 1809, which was the first and only publication of "The Christian Association of Washington, Pa.," an organization composed of members of different churches bent on Christian union and missionary propaganda. Their first church was organized in 1811 at Brush Run, Washington County, Pa., but the year before friends of theirs had established one in New York City and in 1803 Barton W. Stone, who in 1832 formed a coalition with the Campbells, had taken the same position in Kentucky. These foregleams were to the Declaration and Address what the Mecklenburg Declaration and the Boston Tea Party were to Thomas Jefferson's immortal document of July 4, 1776.

From 1813 to 1820 the Campbells were connected with the Baptists. But having

been received without endorsing the Philadelphia Confession of Faith, and evincing no disposition to conform to its tenets, their relation with the regular ministers of the denomination was increasingly strained. Originally the Campbells, Stone and Walter Scott, who soon became a man of might in the movement, were Presbyterians, either Seceder (now United) or regular.

The Disciples have grown westward with the progress of the nation. In the United States they rank sixth numerically among Protestant bodies. In Missouri they are first, and nearly or quite so in Kentucky, Indiana and Oklahoma. Thruout the upper Mississippi Valley their influence is proportionate to their membership, and they are enlisted aggressively in the cause of prohibition and other reforms.

Pleading from the first for Christian union and insisting that the abandonment of human creeds, denominational names and post-apostolic authority, and restoring the primitive Church just as the Apostles left it, to give it at once union, liberty and truth, they seemed to be only adding confusion to the sectarian strife of the day.

For a hundred years they have stood Gamaliel's test. In human frailty the balance between liberty and union, the centrifugal and centripetal forces of Church life, has wavered but has never failed. Denounced by the other denominations as heretics and Ishmaelites in almost every new field, the day of their success finds them in cordial fellowship. The Young Men's Christian Association, Christian Endeavor Society, International Sunday School Association, Young People's Missionary Movement and Inter-Church Federation Council accord their representatives full place and power.

The sincerity of their plea for Christian union is attested by their general readiness to co-operate in evangelism, missions and reform. It is further demonstrated just now by the character of their centennial campaign. "That they may all be one; that the world may believe," is their chief watchword, and "Where the Scriptures speak, we speak; where the Scriptures are silent, we are

silent," defines their method, as it has for a hundred years. No denominational monument is being erected, and sectarian feeling is energetically discouraged. The endeavor is not to do something spectacular and extraordinary, but to make a fuller approximation to the Christianity of Christ, in its fruits especially.

Seven of the centennial aims are for individual and household piety and progress, from "Daily Worship in Every Home" to "Every Home Anti-Saloon Territory." Seven look to betterment of each congregation: "All the Church and as Many More in the Bible School," "Every Church Its Mission," etc. Each of the seven departments of missionary, benevolent and educational activity has its goal or goals. Seven general aims stand out before the entire brotherhood.

Many of them looked impossible of attainment. So we are surprised to learn that several have already been quite surpassed. Reaching the aggregate missionary aim of a million dollars two years ahead of time seemed to justify increasing it by 50 per cent. for 1909. The enrollment of 80,000 teacher-training students a year ago apparently warrants over 100,000 graduates now. Reports in the Church papers of hundreds of revivals, with the accession of tens of thousands of members, are taken to indicate widespread application of the personal principle, "Each One Win One," as well as unusual ability in the preachers.

But the greatest rejoicing in conventions and journals is reserved for actual steps toward union. Many occasions for this have come within the centennial period, since October, 1905. A number of local congregations of Baptists and Disciples have united. In Western Canada their provincial missionary organizations have been combined. In Southern California a college is held jointly with the Congregationalists. In Chicago the Memorial Baptist and First Christian Church have been amalgamated. The high tide of enthusiasm in every convention or congress of the Disciples is reached when some representative Baptist or Free Baptist pleads for the reunion of these two bodies as a step toward the answer to the Saviour's intercessory prayer.

The Sense of Measure

WHY does all the world smile when Keir Hardie gets excited over the forcible feeding of suffragets? Why does it look on with irritating amusement, and never a quiver of sympathy, when the suffragets try to embrace martyrdom? Why does it impatiently refuse to listen to the demonstrations of every new prophet of social reform? Have we become indifferent to evil, callous to suffering and cold toward every generous enthusiasm that thrilled us in the days of our youth, when we pored over tales of patriotism and declaimed the orations of Patrick Henry on Friday afternoons?

Not to be too sure about it, we yet venture the guess that we really haven't lost all the fine ardor of an earlier time. We are living in an intensely practical age, and practical experience develops a sense of proportion, a delicate apprehension of the relative size and importance of things which, at its best, shades into the sense of humor. We are disposed to see in the present-day attitude of mankind toward quixotic folk of every sort a satisfying proof that the human race is attaining the most valuable of all aptitudes, namely, the sense of measure.

As a matter of fact, the world does not laugh at self-sacrifice, at earnestness, at heroic effort, when it is adapted to the end in view, and graduated to the magnitude of the task undertaken. The intense interest manifested in Peary's successful excursion to the North Pole, the culmination of years of study, calculation, careful planning and experiment, shows plainly enough that we can still be stirred by great deeds. Nobody thinks of smiling at the men and women of Russia who risk everything in the struggle for political liberty. No one looks cynically upon the tireless efforts of a Wilbur and an Orville Wright to master a practical problem that has hitherto baffled the ingenuity of the human race. Sincere interest is always called forth by moral enthusiasm, inventive effort, reformatory zeal, if it is backed by an evident comprehension of the relation between means and ends, and some real sense of the adequacy of the means. Ridicule is the portion of innovators, however genuine their desire for the amelio-

ration of the human lot, who lack the scientific and saving sense of measure.

It is well to realize that there is a moral quality, as well as a kind of propriety, in this everyday discrimination which a practical world makes between big deeds and mock heroics, between stubborn fighting for victories that can be won if we are stubborn enough, and frenzied assaults upon the ramparts of the universe. The resources at the command of each generation are finite, and for every act of careless squandering it goes without something that it might obtain and enjoy.

So a certain amount of cynicism, with its admixture of seemingly heartless ridicule, has its useful part to play in the struggle for existence, and we need not reproach ourselves overmuch if, without malice, we have to hurt the feelings of high-strung social renovators, whose destruction is their own poverty of common sense.

Not to point the moral more than we adorn the tale, we acknowledge that these observations are called forth by the flood of nonsense that just now is pouring thru the press and uttering itself audibly from platforms and hustings upon the possibility of making everybody comfortable, sweet, reasonable and tidy, if only we would push a few concrete and imperative reforms to their consummation. Give women the ballot. Abolish the private kitchen. Socialize the means of production. Annihilate Tammany Hall. Make the street railroads give a bale of transfers for a nickel. Set broken bones by mental effort. Attain the Ultimate Good by belonging to a Perfect Life Society at ten dollars per annum. Against not one of these specifics for beatitude have we a word to utter. Only, from the standpoint of the truly genial philosopher, we wish that we could make the moral doctors who prescribe them understand just why it is that a hard-working but good-natured world laughs at their unction and hurries on. The hard-working man has learned that everything that he gets costs something, and he asks what it shall profit a man if he ride Rosinante the whole week, and get "goodby" in his pay envelope on Saturday night.

Conservation and Reclamation

ONE of President Taft's late formal speeches was directed to irrigation and conservation, particularly to forests and streams. He stands by Forester Pinchot's work, as he stands by Secretary Wickersham; only he wants legal authority for all that shall be done. The work of creating reservoirs and reclaiming dry lands must go on, even if the demand at enhanced prices for the new irrigated lands is not rapid enough to supply immediate funds for new work. It will pay to create a moderate loan for the work of irrigation, even as in Ireland the British Government has advanced money to provide the purchase of estates which will be sold to prospective owners on long payments.

But the East must have part in these advantages as well as the West. The East has no jealousy of the West, but large needs appear here as well as there. It is not simply that the inland waterway must be provided, already begun in the long-belated digging of the canal which cuts off Cape Cod, but in the reclamation of immense waste spaces of swamp all along the Atlantic coast from Maine to Florida and even Texas. In Holland such loss of the best agricultural land, left so long to marsh grass and Joe pye-weed, would not be endured.

Take, for example, the Jersey Meadows, right here by New York. Here are thousands of acres, utterly useless, which the New Jersey commuter passes thru twice every day, intersected by a river or two and occasional ditches, breeding nothing but mosquitos and malaria, the disgrace and shame of two great States. It is by no means impossible, or even very difficult, to dike and bank the land and coast so as to confine the waters and shut out the ocean tides. It is amazing that the State of New Jersey, filled with New York business men, should so long have been heedless in this matter. The State, perhaps by arrangement with the State of New York, ought to buy up the entire meadow front and undertake a great work of reclamation which would add millions of wealth and hundreds of thousands of population. One of the advantages, and not the least, would be the escape from the mosquito

pest, which has given New Jersey almost its chief fame, or infamy. The "Jersey mosquito" is known the country over. The Jersey marshes would be covered with market gardens and factories and towns, while Hoboken and Jersey City and Newark would be all one great community, united instead of separated by muck and water impassable except along the railroad and the ancient causeway.

What is true of the swamps about New York is equally true of the coast of Maryland, Virginia, the Carolinas, Florida and the Gulf States, only here the contrast between the wildness of the Jersey Meadows and the congestion of the cities at their borders is most striking. While we have been populating the Western prairies and forests we have neglected the mines of agricultural wealth right at our doors. We do not ask the United States Government to do this reclamation. It is enough for it to help the inland waterway. But we do call the attention of the State legislatures to what is a crying need at the present time, and a source of uncounted wealth far too long overlooked. New York and New Jersey have just now agreed to save their beautiful Palisades; let them take the even more important task to reclaim their water-soaked land.

8

The Hierarchy of Christian Science

It is not easy for the uninitiated to understand why Mrs. Eddy's religion should be called Christian Science, for there is nothing of science in it, and it is a queer kind of Christianity which gives its followers a new Bible, provided, at a round price per copy, to its believers, as well as a new prophet. In this it much resembles Mormonism, which in the Religious Census is not classed as a branch of Christianity. But we are not now concerned with the tenets of Christian Science, but with its ecclesiasticism.

Christian Science, which might better be called Eddyism, has many branches, in many cities and towns, each directed by one or more "readers," of whom part are women, after the example of Mrs. Eddy herself, who is the Chief Reader, Prophet and Revelator of

the entire phalanstery. Whether Mrs. Eddy is still living or not we do not know; she is kept, if alive, in such strict seclusion by those about her who control her movements that she is never seen, and an heir at law has brought suit to make investigation whether she is still in the flesh. It is to be presumed that if still alive she is not able to exercise rule over others or even to command herself. But with her vitality we are not now concerned.

Christian Science has a splendid temple in Boston, the headquarters of the faith—for it would not be courteous to call it a superstition or a delusion, much less a fraud, which it certainly would be if, as alleged, Mrs. Eddy is not living. Boston is the headquarters, where Mrs. Eddy, or her cabinet, rules. Next in importance is the congregation which meets in New York, where it has a fine temple, second only to that in Boston, and where Mrs. Augusta Stetson, a woman of fine presence, of ability and wealth, has been the First Reader, presiding over the "First Church of Christ, Scientist." In the whole country, from 1890 to 1906, the Church of Christ, Scientist, has grown from 8,724 to 85,717, and its wealth of church property from \$40,666 to \$8,806,441.

But Mrs. Stetson is no longer First Reader of the First Church in New York. She has been removed, not by her followers here, but by the cabinet that rules the Mother Church at Boston, and her successor here is a man, we regret to say. We had taken Christian Science to be superior to, or at least a pleasant variation from, Mormonism, in that it has been a woman's religion. Mrs. Stetson had become so important a leader that she was spoken of as Mrs. Eddy's successor. She seems to have become too strong for safety to the rulers of the Mother Church in Boston, and she had to be removed, and this was done by a decree from Boston, as peremptory as any that could be emitted from Rome to depose a bishop or degrade a priest or excommunicate a city. A long string of charges are brought against her teachings, but they amount only to general assertions, without specifications, that her teachings are not in accord with the principles of Christian Science, that she hinders the spiritual

growth of those to whom she teaches the principles of healing, and that she makes them disciples of herself rather than of Mrs. Eddy. Therefore the rulers at Boston have revoked her license to teach and have silenced her. At present she submits.

But what is the authority of the directors at Boston? Why should they give orders as to what the church in New York should do? Are they dictators of the entire body of believers thruout the country? Apparently they are, and yet not chosen by the general Church of Christ, Scientist, but self-appointed, or appointed by the prophetess of the body, if she be still alive. But if the latter she is unquestionably unable to remove them. She is a puppetess in their hands. They are, practically, a self-appointed cabal, or at best appointed by the temple in Boston, the so-called Mother Church, which they rule. In these days of liberty, of self-government, when all Protestant Churches are ruled by its membership, there has grown up out of Protestantism this monarchic organization belonging to the Middle Ages, patterned after feudalism, in which the people have no rights except those of submission.

Yet why should not the followers of this new faith submit? They have consented to believe in a book which no thinking person can clearly apprehend. They learn to put aside their own consciousness of suffering, to deny what they feel, to contradict their own intelligence, and to see supernal wisdom in a revelation of wordy nonsense. Having laid aside their own reason at the will of another it is not so bad that they should also yield their freedom. If they have retained any sense of their rights, and are not quite obsessed, they will, some of them, demand to know what is done by the directors of the Mother Church. Either there will before long be a division of the body, or a gradual disintegration when Mrs. Eddy's death is at last confest.

Taking Care of Our Trees

MAN never was beaten by anything but insects; and with them the struggle is today. The American man, supposed to be the best product of the *genus homo*, loses each year out of his hard-

earned profits, by what we may call the hands of insects, one-fifth of all he can produce. This is not to include the loss of the trees themselves, with which goes also a large future income as well as present comfort. These insignificant rivals of ours make up for lack of size by multitude of workers and rapidity of accomplishment.

What we want to get at now is the easily available material with which the most common home-builder can contest the field, leaving the complex prescriptions for professionals and specialists. Thanks to our agricultural colleges and experiment stations, the use of arsenites and Bordeaux mixture has become so simplified that almost anybody understands and can apply them, and they are being more and more simplified each year. This Bordeaux mixture is usable for nearly all sorts of fungus or blights and mildews. It is sulphate of copper, under a technical name, and is easily compounded by the least educated farmer. Simply mix or dissolve in a barrel of water three pounds of copper sulphate, adding to it a solution of three pounds of slacked stone lime. This mixture, well stirred, is sprayable thru a good nozzle over your tallest trees. You need only a double-action, brass-lined force pump, at a cost of about six dollars. Here is a weapon that anybody can keep in his woodshed, and when needed for use, insert in the barrel and carry the barrel about on a cart. There is hardly a shade tree or a fruit tree that will not be the better for a good application of this Bordeaux mixture early in the spring, before the leaves appear; apply again at the blossoming period, and once a month later right thru the year. The expense is not heavy and the labor is not severe. The brighter your foliage and the more vigorous the growth of your tree, the more able it is to resist insect attacks.

This Bordeaux is equally useful in the potato field to prevent blight, and in the vineyard to protect the grapevines. When it comes to applying the arsenites, still the Bordeaux can be used again by mixing with the other compounds. Our present most available arsenate for the farmer to use, or the common householder, is arsenate of lead. So much

damage may be done by the use of Paris green or London purple that they cannot be recommended for general use. Make a paste of one pound of the lead arsenate, then thoroly dissolve in a barrel of water, and apply to your trees. It is better to add to this mixture a couple of pounds of lime; or if Bordeaux is used with it you already have the lime. Here is a very simple and safe mixture, far safer than the Paris green to have about, and it can be used by any amateur tree grower.

Kerosene emulsion is another home-made affair that can be kept on hand at all times, and is of about equal use in the orchard and lawn and garden. It is made by dissolving half a pound of hard soap, then adding one gallon of kerosene, after which the whole is churned with a small pump until the mixture appears like soft soap. A pail full of this mixture should always be on hand, so that the housewife can apply it to her roses or the house man to his plum trees and hedges. A strong mixture, taking at least a pint to a pail full of water, can be applied to apple tree bark or pear trees or shade trees. It will keep an indefinite length of time without losing its value. No insect likes it, and it stimulates the bark of your trees to a healthy power of resistance.

The common householder has, however, at hand—only as a rule he throws it away—one of the best and simplest of all materials for fighting his insect enemies, and at the same time controlling atmospheric conditions to prevent the development of blights. What is wanted is to equalize the conditions in and about the roots of trees. This can be done of course with almost any kind of mulch, but best of all with the coal ashes that our Northern homes waste. This material is porous enough for air, while it is retentive of moisture and heat. The roots beneath are protected from sudden atmospheric changes, and go on doing their duty without interruption. But the best thing about it is that these ashes make splendid material for the borers to break their jaws on. Those that gnaw into our apple and forest trees are met by a hard proposition and beaten. The ordinary tree grower does not look often enough to the roots of his trees. If he

did he would find the cause of weakness to be the boring of beetles near or into the roots.

Preventions are always the rule before remedies, and these can be thought out in every direction. No possible set of rules or remedies can serve for absolute protection. The tree owner's first aim should always be to secure equalized temperature and equalized moisture about the roots of his pets. This equalized or balanced condition can be disturbed in ways not often considered. If a well-developed tree is suddenly trimmed up five or ten feet, a shock is given to the tree that will very surely cause disturbance. Half of our shade trees that suddenly die, or half die, are put on the road of decay by this unwise trimming. It exposes the bark to the sun, causing blistering and splitting; then insects enter, as a provision of Nature, to turn decay into another form of life. In this way thousands of our beautiful roadside trees are ruined annually.

This whole subject is of such general importance that it should be carefully discussed, to the displacement of more or less politics and theology. It is not simply a question of the beauty of our country homes and our street sides, but a question of sanitation and comfort. It not only involves an enormous amount of wealth, but it is a question of the habitability of large sections of our country. Good, healthy trees breathe out to us ozone and oxygen, but sickly trees not only fail of doing this duty, but give us more or less poison in the way of carbonated gases. A village that is well provided with shade trees, wisely cared for, is a healthy village. You can do nothing better to abolish fevers from your home than to surround your house with clean, wholesome trees, at the same time running over your buildings grapevines. This is a provision of Nature that what we most need for food we also most need for health. The apple tree happens to be one of the choicest of our shade trees as well as fruit trees. A grove of pear trees is as good a protection as a grove of maples. At any rate, do not be whipped by the bugs. It is a square and fair fight on their part, and

it is not one that is altogether harmful—even if they come out ahead. Nature does not mean to let us indulge in sick trees. She immediately turns in an army of hard workers to eat them up or bore them to the ground. The owner of a tree should be a careful student, a close investigator, and should understand that he has no privileges in the way of breeding diseased vegetation.

Our Merchant Marine

An extremely important matter was that which President Taft presented to his hearers at Seattle. He urged that Congress aid our commercial marine by subsidies which shall provide for vessels carrying the American flag and the American mails from our Pacific ports to South America and the Far East. The money to give this aid he would take from the large surplus which our foreign postage gives us. Of course, this would still further increase the total postal deficit, and it would give special donations to the companies that shall own the steamship lines. But our national policy is protection to special industries, to manufacturers of iron, cotton, woolen and other goods, and the President very fairly asks why it is not as proper to subsidize transportation men as manufacturers. There is no answer to that, for the principle is the same. The only question is, How far shall special favoritism go? When is it profitable to the people on the whole, and when is it nothing but personal graft? In this case the President can fairly present the further argument that other nations subsidize their steamship lines, and we must do the same or fall back beaten. We create a great war navy just because other nations do it, and why not join the rivalry for a commercial marine? It is a pity that we should have to do this, but we may feel compelled to do so, until the nations can agree to trust each other and depend on the natural laws of unassisted trade. We recall that all the European nations were giving a bounty to the manufacturers of beet sugar a few years ago, but at last were able agree simultaneously to give up the donation, so that all might be relieved together, and free agriculture take its course.

Mr Ginn's Peace School There is no better friend of peace in the United States than Edwin Ginn, the Boston publisher. His firm has been the foremost one to publish works on Peace, and in many other ways unknown to the general public he has aided the movement whose aim is to substitute law for war. It has long been known among Mr. Ginn's friends that his life's dream was to establish a great agency to work thru the schools, colleges and press for universal peace and that he was devoting a great deal of time to the working out of this plan. Last week it was publicly announced that the first steps toward the organization of an International School of Peace have been taken, that Mr. Ginn was ready to contribute \$50,000 a year toward its support and ultimately to endow it. We congratulate Mr. Ginn on his generosity and foresight. This is the formative and constructive period in the Peace Movement. A dollar spent now will go as far as ten a decade hence. With \$50,000 a year an efficient board of trustees will be able to revolutionize the teaching of peace in our schools and colleges—and thus do more for the peace of the world than a dozen warships. Mr. Ginn shows more statesmanship in this respect than the Congress of the United States.

Nebraska in London "Nebraska? Where or what is Nebraska?" will be the exclamation of the English antiquarians, now that they see one Professor Wallace, of the University of Nebraska, coming to London and presenting proofs to show that Shakespeare's famous theater was not at the place where, on a present brewery, they were about to set up a commemorative tablet. Why from some wild forest or prairie among the Indians should a man come to instruct them in Shakespeare lore? This teaches that learning is cosmopolitan, that the Oxfords and Harvards have no monopoly of it, that the best or the most recondite may be expected from the newest, for the youngest streams of knowledge have been fed from the oldest fountains, and Nebraska can visit London and there discover what had escaped the

search of England's most persistent worshippers of the genius of the Myriad-Minded. Possibly Professor Wallace is wrong in his conclusions, but he has added new material for the life-history of England's most famous and least-known son.

King David's Sleep How they do things in the Turkish Empire is illustrated by a German victory in Jerusalem. The Emperor of Germany purchased a fine site on Mount Zion for \$20,000 and gave it to the German Benedictines. On it they have built a splendid church and a spacious convent. But there was needed a chime of bells for the campanile, and that had been presented, but the Government, liberal as it is, refused to allow the bells to be mounted, instigated by the dervishes, who declared that their ringing would disturb the sleep of King David, and that he would rise and bring down some terrible calamity on the country. But there happened to come to Jerusalem a large party of German travelers or pilgrims, who visited the convent and learned of the trouble; and without asking anybody's permission, fifty of them—doctors, lawyers, merchants, and even members of the Reichstag, hauled away at the ropes and raised the bells to their place in the tower, over which the German flag was floating. Then they repaired to the church and sang, "*Grosser Gott, wir loben dich.*" That the *Grosser Gott* approved this lawlessness we are not informed, but the Vali was very angry. The thing had been done, however; the German embassy at Constantinople used its good offices, and there the bells stay, and still King David sleeps soundly. Thus, lawfully and lawlessly, progress moves.

The Dying Concordats Concordats between Church and State ought to come to an end. The Church ought to have absolute independence unruled by the State, and the State equally ought not to be hampered by the Church. The Church in France is freer and will be stronger for the abolition of the Concordat. The Concordat between Bavaria and the Vatican gives the former the right

of nominating the bishops of that country. A recent number of the *Mémorial diplomatique* states that Rome sent his Bull of investiture to the new Archbishop of Munich directly, with no reference to the nominating power conceded to Bavaria by the Concordat; and not only the non-Catholic, but also the Catholic press of the country is much wrought up about this open contempt. There must have been some purpose in the declaration of ecclesiastical independence. Troubles have been brewing for some time over the school question and the Schnitzer affair at the University of Munich, and lastly Doellingerism is far from dead. To set aside the Concordat in the face of all this seems a pretty fair proof that the Curia does not mind this disaffection; this, too, in spite of the fact that Rome recalled an unusually stupid Italian nuncio and named in his place a German monk. It is not yet known whether the Bavarian Government will deny the *exequatur* to the new Archbishop. If it does His Grace will have the honors, but an empty purse to keep them up, for the State pays the salary, and the purse usually claims the right of control.

It is now some years since Sir William Crookes frightened us all with the warning that the time is approaching when the earth will not supply the amount of wheat needed for the increasing population. But at the Congress of Applied Chemistry in London Professor Beruthsen, of Leipzig, describing how the nitrogen of the air is now economically fixed into a solid form as calcium nitrate, relieves our fears, for he says that a million tons a year may be expected to be produced to be applied to land greatly to increase its fertility. The new fertilizer is already being economically manufactured.

The other day a Chinese patriot, Yung Lin, grieving over the misfortunes of his country and the corruptions of administration, wrote a long letter in the most approved literary style to the Regent, earnestly bewailing the evil times on which he had fallen and calling for re-

form. Recognizing the boldness of the liberty he had taken, he proved his devotion by committing suicide. Thereupon an imperial edict confers on him posthumous honors as one who "had sacrificed his life in order to display his patriotism," a peculiarly Chinese way of doing it. Of the flowers of speech in the letter we quote but one, in which, to show the miseries that have befallen the people he says that "rice has become as dear as pearls, and firewood as costly as cassia buds."

We are glad to know that the late Charles F. McKim, architect, gave by his will over \$100,000 to endow the American Academy at Rome as a school of art. Now we would like to see the American schools of archeology at Athens, Rome and Jerusalem properly endowed. These schools give us our teachers in their departments. And we ought to have similar schools established in Cairo and Bagdad for the study of the ancient history, language and art of Egypt and Babylonia. What rich man will provide for these real needs?

An entire city in Italy, of 12,000 inhabitants, has been excommunicated *en masse* by the Pope for physical injury to a bishop sent to preside over its churches. The people who united in this outrage certainly deserved whatever rebuke excommunication can give. They may not care, but so long as they stay in the Church they should obey it. The way out is open; the duty within is loyalty, or at least peaceable decency.

The Fourth World's Convention of the Young People's Christian Endeavor Society is to be held in November, where in all the world but under the shadow of the Taj Mahal, in Agra, India. A special steamer will carry the American delegates and visitors. It is wonderful how this society and the Young Men's Christian Association are covering the world.

Steel Corporation Shares

THE most striking feature of the movement in securities on the Stock Exchange, last week, was the continued advance of the price of Steel Corporation common shares, which rose on Saturday to 92 $\frac{7}{8}$, a gain of 8 $\frac{3}{8}$ since the week preceding. Transactions in Steel common amounted to about 1,200,000 shares, or nearly one-fifth of the total. There were sales at 41 $\frac{1}{4}$ in February last, and now, when the dividend is at the rate of 3 per cent., the price is more than 30 points above the highest figures reached when the dividend was 4 per cent. There is no evidence that the general public is making the very heavy purchases of this stock at a price that yields less than 3 $\frac{1}{4}$ per cent. Everybody knows that the steel industry has risen again almost to the high level reached before the panic, but neither this recovery nor the reports of the Corporation account for the very large sales, at prices above 90, of a stock that pays 3 per cent. now, was paying 2 per cent. a few months ago, and has never paid more than 4 per cent.

Many who are not familiar with the statistical record believe that the Corporation's share of the iron and steel industry is larger than it really is. The trustworthy reports of the American Iron and Steel Association, comparing the output of the independent manufacturers with that of the Corporation, show that the latter's share of the total in 1908 was as follows, in percentages:

Shipments of Lake ore.....	56.0
Production of ore.....	49.3
Production of coke.....	31.3
Pig iron.....	43.5
Bessemer steel ingots.....	60.2
Open hearth steel ingots.....	48.2
Bessemer rails.....	58.7
Open hearth rails.....	45.0
Structural shapes.....	47.1
Plates and sheets.....	51.0
Wire rods.....	67.0
Bars, skelp, nail plate, etc.....	31.9
Wire nails.....	61.2
Tin plates and terne plates.....	72.0

The Association's reports for six years show that the Corporation's percentages, almost without exception, were larger in 1902 than in 1908, altho its output in 1908 included for the first time that of

the Tennessee Coal, Iron & Railroad Company. This does not indicate that the Corporation has fallen behind, for there has been an actual increase of its output; but it does show that the Corporation has not prevented—nor, so far as we can learn, attempted to prevent—the growth of the independent manufacturers in the same field. It has set a good example by publishing full reports quarterly, and its operations are confined, we think, to the legitimate pursuit of the business and industry in which it is engaged.

Business Indications

THE Pennsylvania road has ordered 200,000 tons of rails, and the prediction is made that the rail output in 1910 will exceed by 500,000 tons the record output of 1906. A slight increase of the price of tin plate is announced. Chairman Gary says that the Steel Corporation is not seeking to force higher prices. It prefers, he adds, that the prices of certain steel products shall not rise to the high levels of two or three years ago. Incorporations in the Eastern States during September (\$225,925,000) were larger than in any preceeding month since January, 1907. The Detroit street railway company has voluntarily increased the wages of all its employees who have been in the service two years, owing, its officers explain, to the increased cost of living. "The industrial and commercial situation as a whole at the beginning of the last quarter of the year," says *Dun's Review*, "is that of a full return to normal conditions."

....On October 1 there were 7,012 national banks, with \$963,201,925 of authorized capital and \$702,807,459 of circulation, of which all except \$26,776,066 was secured by bonds.

....The directors of the Mercantile National Bank last week increased the annual dividend on the stock of the bank from 4 to 6 per cent. They also determined to change the periods of payment from semi-annual to quarterly. The next dividend is payable October 15.

SAMUEL McROBERTS.

Samuel McRoberts, treasurer of Armour & Co., and for three years president of the Illinois Tunnel Co., the operating corporation of the Chicago freight subway, was last week elected a vice-president of the National City Bank, of this city. Mr. McRoberts went to Chicago from Michigan some years ago and obtained a position on the Armour staff as an attorney in the collection department. He obtained almost instant recognition and when P. A. Valentine retired from the Armour treasurership Mr. McRoberts was chosen to succeed him. His election to a vice-presidency of the National City Bank gives the bank five vice presidents, the others being W. A. Simonson, H. M. Kilborn, James A. Stillman, and John E. Gardin.

Automobile Fires

EVERY automobile is constantly menaced by fire. Such fires are in fact alarmingly frequent. During the season many cars are damaged and some are totally destroyed by fires originating within themselves. Many automobile fires are extra hazards because of the high value of some of these cars. For the cost of certain cars used by the very rich a very comfortable house may be purchased, together with the lot such a house stands upon. A motor car taking fire, therefore, in the suburbs, on a lonely road, is quite liable to total destruction because of its absolute lack of ordinary fire protection, and the property loss is liable to be a serious one.

Many if not all automobile fires originate because of the ignition of spilled gasoline. The alphabetic precaution ought consequently to be in the direction of guarding against the escape of fuel from the tank, piping and carburetor. No accumulation of spilled fuel ought ever to be permitted on or about the car. Eternal vigilance with automobiles is the price of safety, quite as much, perhaps even more so, than elsewhere and otherwise in the world. Spilled gasoline commonly ignites because of electric sparks in the ignition system, altho this source of danger is by no means the only one. The match used to light the cigar or cigarette is often effective as a car disabling agent. Another source of danger is any flame exposed near a car. A red-hot exhaust pipe is exceedingly liable to fire a car if it has contact with oil-soaked woodwork or the fuel tank. Carelessness in filling tanks is a perpetual fire hazard, ever present in the operation of automobiles, against which warning cannot too often be given.

The accidental flooding of the carburetor is another common means whereby gasoline is spilled in the ordinary use of a car. This may arise because of the sticking of the float in a depressed position; a particle of foreign matter may easily find lodgment between the automobile needle valve and its seat: there

may be a leakage in the gasoline piping at its union with the carburetor; the pipe may lack proper support and fall in consequence, resulting in a leak; a leak may develop in the tank itself, or from some other cause. No matter how the leakage takes place, the hazard arises and ought to be instantly eliminated. A fire caused by a flooding carburetor or a leaky piping is especially to be guarded against, as the supply of combustible material is in both cases constantly replenished from the reservoir tank. In case of fire and a fairly good headway it becomes finally impossible to reach and operate the shut-off valve, altho this may sometimes be accomplished if one has a pair of heavy gloves and considerable nerve, but too much reliance cannot be placed upon gloves or nerve. In case fire develops on an automobile the engine should be instantly stopped as a first essential. In the case of an incipient fire around the carburetor, it is sometimes possible to smother it with a coat, a rug, or blanket, or by means of a rope thrown tightly over the radiator and the hood. The fire may in such a case be smothered or burnt out if the precaution of shutting off the supply of gasoline is taken. Sand from the road is an excellent fire extinguisher, and far superior to water, as the sand soaks up the gasoline, and if applied in sufficient quantity cools the liquid below the point of combustion and shuts off the supply of air. Fire losses, when they do result, are best compromised, if possible, if the compromise is at all equitable, rather than taken to court, as public sentiment is very much against car owners because of their arrogance and the recklessness with which many drive, and the average jury will discriminate against an owner if there is any possibility of so doing.

AN estimated property loss aggregating more than \$500,000 has been credited to moving picture machines in this country for 1900. The rigid limitations on theaters and halls in which such shows are given seems to be highly necessary.

VOL. LXVII NEW YORK, THURSDAY, OCTOBER 14, 1909

No. 3176

Survey of the World

The President's Tour and Speeches

Mr. Taft, on the 3d, in Portland, Ore., attended services at the Unitarian Church in the morning. In the afternoon he addressed the children of St. Mary's Roman Catholic school and laid the cornerstone of a new Universalist church. In the course of his remarks to the school children he said:

"Your Church teaches that loyalty to God is the same as fidelity to country and reverence for constituted authority. So do all good Churches. And we can be very certain that those who are loyal to their Church are loyal to their country—that they who are good Catholics are good citizens, just as those who are consistent members of other Churches find in the doing of their duty to the Churches everything that leads them on to the uplifting of humanity, and the observation of all the obligations of government."

A part of his address at the laying of the cornerstone was as follows:

"I don't know that any one questions the propriety of my being here and officiating on such an occasion as this, or that an explanation of any sort is called for. But I want to say I believe it to be the duty of the President of these United States to welcome and to suggest every instrument by which the morals and religion of the community may be elevated and maintained. Not long ago I officiated at the cornerstone laying of an orthodox Congregational church in Washington. Then I appeared in the pulpit of a Jewish tabernacle in Pittsburgh. But a few days ago I helped to lay the cornerstone of a Catholic institution in Helena, Mon. And now it is my great pleasure to assist here today in laying the cornerstone of this Universalist church, which, like my own, the Unitarian Church, is known as a liberal one. I am glad always to be present at such occasions as these, for I believe the cornerstone of modern civilization must continue to be religion and morality."

He then spoke of his experience in relation to the Catholic Church in the Philippines, and of his conversation with the Pope during his visit to Rome, when he

had pointed out that in no European country had the Catholic Church flourished as in America, where there was complete separation of Church from State. He continued:

"I think we have reached the time when the churches are growing together, when there is less bitterness of denominational dispute, and that no matter what creed we may follow, the churches are beginning to realize that they must stand shoulder to shoulder in the contest for righteousness; that we all stand for the fatherhood of God and the brotherhood of man. I am an optimist. I believe we are much better today than we were fifty years ago, man by man. I believe we are more altruistic and more interested in our fellow man than we have been at any time in the last fifty years. Of course you hear from time to time of instances of selfishness and greed, but the only reasons these instances are given prominence is because we condemn them the more and believe that in calling attention to them they will be made more and more infrequent. No church in this country, however humble it may be, which preaches the doctrine of true religion and true morality, will lack my earnest support to make it more influential whenever opportunity offers."

The preceding evening he had repeated his tariff speech (first made in Minnesota), with parts of his address concerning the Anti-Trust law and the labor unions. From Portland he went to Sacramento, Cal. On the way, at Dunsmuir, he said:

"Everywhere in this country I have found evidence of prosperity, and if signs do not fail we are upon an era of business enterprise and expansion that has never been seen in this country before. Now, with that I would not have you forget that there are certain responsibilities. We have had evils growing out of our prosperity. Men have seized power by means of accumulation of wealth and its use in methods that are not legal and cannot be approved by way of monopoly and otherwise. Now, we are attempting by the general law of the United States to suppress that kind of abuses. They were brought to the attention of the people in a marvelous crusade by my predecessor, Theodore Roosevelt, and it is my

only to continue in politics and to enforce them as far as I may and recommend to Congress that there be put upon the statute books those laws that shall clinch the progress which was made under him, which he preached and which we all look forward to as a permanent condition. But the difficulty is that whenever everybody is prosperous, when everybody is comfortable, then is the time when our old friend Satan steps in and helps along the evil cause. Then is the time when we are apt to be inert and enjoy the things we have without looking forward in the future and seeing that the evils will grow and ultimately swamp us. You should select your representatives and have them know you are watching them in Congress and see that they follow the line of enforcement."

In Sacramento he repeated his address upon the conservation of natural resources. At Berkeley, on the grounds of the University of California, he was greeted by Professor Moses, formerly associated with him in the Philippine Commission. There he spoke of the difficulties attending the business of governing, difficulties not always appreciated by critics. But the high standard set up by the critics was of great use in lifting up government and the people. The good citizen recognized that compromise was necessary in popular government:

"He must play the game. He is in popular government, and he has to take what popular government gives him until by his influence with the people who control he can lead them in the direction which he would, and if they do not go in that direction he has to play ball with them and follow them."

Speaking of his first trip to the Philippines, following a visit of the commission to Berkeley, he said:

"The future was dark and obscure, and if any man had said that the trip would land me in the Presidency of the United States I should have felt like characterizing him either as a falsifier or a man without sense. But that is it. You never can tell what the future is going to bring about. It seemed a long way around to the White House to go out 10,000 miles into the tropics, but that is where it landed me, and, as I started from Berkeley, it delights me now that I have reached that goal, if it can be called a goal, for I was not wandering in that direction consciously."

He arrived at San Francisco on the afternoon of the 5th. While crossing the bay he saw a transport which was about to sail for the Philippines with soldiers. "Doesn't that make you homesick?" asked one of his companions. "Yes," he replied, "and I would give anything if I were going with them." In

San Francisco he had a grand reception. While there he laid the cornerstone of a new Y. M. C. A. building. At a banquet he repeated his speech in favor of subsidies for the merchant marine. Leaving the city on the morning of the 6th, he started for the Yosemite Valley, which he was to see for the first time. With him were the Governor of California, Senator Flint, three of the State's Representatives in the House, and John Muir, the well-known naturalist and geologist. At Merced the people gave him a golf driver made of eucalyptus wood and trimmed with gold. There he spoke for a few minutes in praise of golf. He slept on the night of the 6th at El Portal, near the gateway of the valley; all the next day he was in a stage coach; on the 8th he saw the big trees and passed on to Glacier Point; and at night on the 9th he was again at El Portal. The following morning he resumed his journey, going southward to Los Angeles.

Politics in New York City The campaign in New York City was culminated on the morning of the 9th by William R. Hearst's acceptance of a nomination for Mayor. There are now three candidates in the field—Judge Gaynor (Tammany), Otto T. Bannard (Republican and Fusion), and Mr. Hearst, who has been nominated by members of his Independence League and by others. At the election in 1905 (when he was a candidate) his vote almost equaled that of the Tammany Democratic nominee, Mr. McClellan, who is now Mayor, and whose election was contested. The third candidate then, William M. Ivins (Republican) now supports Mr. Hearst and spoke for him last week at the mass meeting by which the nomination was made. Mr. Hearst had been commending Judge Gaynor. He believed, he said, that the Judge would make a good Mayor, but was sorry that Tammany was to be allowed "to use his good name as a cloak for another raid on this pillaged city." He then urged independents "to elect Judge Gaynor and defeat Tammany Hall." Four days later he accepted the nomination, upon condition that his colleagues on the city and county tickets should be those already nominated by the Fusion

forces. The main and perhaps the only objection to Judge Gaynor, he said, was the fact that in this campaign he was "allied with the most atrocious array of soiled and damaged political rags and remnants ever exposed for sale upon the bargain counters of Tammany." On the 11th Judge Gaynor accused Mr. Hearst of breach of faith, asserting that the latter had repeatedly and recently promised to support him, and producing a letter written by Rudolph Block, one of Mr. Hearst's editors, confirming this statement. Mr. Block gave a report of conferences in which Mr. Hearst had, he said, urged Judge Gaynor to be a candidate, promising to support him "on any ticket." Whereupon Mr. Hearst denied that he had ever so urged the Judge, or had made such a promise. — Mr. Jerome, District Attorney for several years past, and recently an independent candidate for re-election, has withdrawn from the canvass.

Minister Crane Returns to Washington Charles R. Crane, of Chicago, recently appointed Minister to China, was about to sail from San Francisco to assume the duties of his post when, on the 5th, he was suddenly recalled to Washington by Secretary Knox. There were rumors that he had been indiscreet in public addresses and interviews, and that he was to be reprovved. He had been talking frankly at dinners about questions which the Minister to China must consider. He said to the press, however, that President Taft had permitted him to speak in this way. Then it was assumed that he had been called back in order that instructions might be given to him concerning very recent developments in the relations between China and Japan, affecting possibly the "open door." Mr. Crane arrived in Washington on the 10th, and it was soon asserted that the cause of his recall had been, not his speeches (altho these were regarded as undiplomatic), but his alleged responsibility for statements published in the press concerning the attitude of the United States toward Japan's new treaties with China. At times the dispatches of the Associated Press have a semi-official character. Those published on

the morning of the 11th contained the following assertions:

"When Mr. Crane is able to clear himself in the eyes of Secretary Knox of an accusation of a serious breach of what the State Department regard as the first principle of diplomatic discretion, the conference with his official chief may result in the abrupt termination of Mr. Crane's connection with the diplomatic service."

"The State Department has in hand, it is said, what it regards as more or less convincing evidence that Secretary Crane, on the eve of his departure for the Far East, became responsible for the publication in a Chicago newspaper of what the department views as a most indiscreet discussion of the attitude of the United States toward the two treaties recently negotiated between China and Japan. This the department holds to have been the more serious because that attitude is still under confidential consideration, no decision having been arrived at."

It does not appear that in the newspaper article Mr. Crane's name was mentioned or that any part of it was openly ascribed to him, but the dispatches say that "matters of a highly confidential nature were divulged."

The Kentucky Night-Riders Reports from Kentucky point to the renewal for another year of the tobacco growers' agreement, as planters controlling more than half of the tobacco acreage have given their signatures. At the same time, the night-riders are again at work, punishing those who refuse to sign. A farmer living near Cynthiana was recently taken from his home in the night and severely whipped. This treatment led him to sign the agreement. Governor Willson has published a statement in which he advises persons so attacked to defend themselves, and virtually promises to pardon those who in such defense shoot to kill. He says:

"You will remember that I have made public addresses to our people asking them to defend their homes and assured them that if they did defend their homes and were careful not to make a mistake and kill any innocent person, but simply necessary defense of their lives, liberty and property, they would not need any lawyer. I have never withdrawn that proclamation. It is my most serious conviction of my duty. It was made with full knowledge of its serious character, and it is my set purpose to keep the faith under that proclamation."

"If men's interest in a business plan to form a combination to raise the price on their crops, which is entirely proper and wise if lawfully carried on, is so great that they will form a pool that falls into lawlessness, why should not self-respecting free Kentuckians form a

liberty, or freedom pool, a thousand times more serious and earnest than any pool for money profit? And why should they not fight for their liberties when the law is behind them and the State Government is with them?"

An independent company of tobacco manufacturers has sued the Burley Tobacco Society (the pool) under the Sherman anti-trust law, asking \$400,000 damages.

Countries South of Us The revolutionary movement in Paraguay is reported to be assuming formidable proportions. Altho the revolutionists in arms are outnumbered by the Government troops, a forced military enrollment of all able-bodied men between the ages of eighteen and thirty-five has been ordered.—Action upon the tripartite treaty concerning Panama has not yet been taken by the Colombian Congress. Reports from Bogota say that the Japanese Consul there is promoting the attempt of Arturo Undurraga, a Colombian engineer, to obtain a concession permitting the construction of an Isthmian canal on the Atrato route and to obtain the support of an Anglo-Chilian syndicate for the project. It is asserted that a canal on this route could be made in three years, at a cost of \$250,000,000.—Official estimates submitted at Washington last week call for \$48,000,000 to be expended in Panama Canal work during the year ending June 30, 1911. This sum exceeds by \$15,000,000 the estimate for the current year.—It is reported that the railway in Mexico, from San Geronimo to the Guatemalan boundary, recently purchased by United States Ambassador Thompson, will be acquired by the Mexican Government. The construction of twenty-five miles of road will connect this railway (called the Pan-American) with the Guatemala Central.—Reports from Brazil say that large concessions of land have recently been granted to United States capitalists, who have acquired water power sites for the generation of electrical force.—Official statements show that the Government expenditures in Cuba from January 27 to September 30 were \$27,089,000, altho the receipts in the same period were only \$25,493,000, including \$2,180,000 derived from the new loan or procured by the sale of bonds of the old loan.

British Politics An unexpected movement was made by the Government in announcing the adjournment of Parliament on October 11 for one week in order to give the members time to consider the finance bill in its amended form. It had been generally anticipated that the House of Lords might receive the bill by the 18th and that the week preceding or the latter part of it would be devoted to the discussion of the bill in its present shape, in which the speeches would be made more for the purpose of bringing the questions before the electorate than for the changing of Parliamentary votes on the bill. Numerous clauses have been added and other changes made in the bill in the course of the discussion in the House of Commons and some time is certainly needed for their amalgamation and the reprinting of the bill. But it is believed that the week's adjournment is really made at the request of the King for the purpose of giving him an opportunity of exerting his personal influence to prevent a constitutional crisis. Distinguished men of all parties have recently been called to Balmoral for conference with the King. Among them were Lord Rosebery, Premier Asquith, Secretary of War Haldane, the Earl of Cawdor and Reginald McKenna, First Lord of the Admiralty. It is not yet known whether the Lords will reject the bill, attempt to amend it, or lay it upon the table and send down to the House of Commons a resolution declaring that their proposals of the Budget are so revolutionary in principle and intention that the House of Lords must withhold its assent until the will of the country has been ascertained. In any case the action of the House of Lords will probably be prompt and this will suit the Liberals, who seem to think that they will stand the best chance of success by an immediate appeal to the country with the issues as they are at present defined. It requires a month after the writs of election are issued to complete the polls, but even in that case it would be possible to bring the new Parliament together in November or at least early in December.—Mr. Lloyd-George, Chancellor of the Exchequer, gave another of his plain talks on the Finance Bill to an audience of 4,000 people in Newcastle. He said that the bill was practically in the form

in which it would be passed in Parliament. "We are going to send that bill up to the House of Lords and get all the taxes or none." He did not know what "poor Lord Lansdowne would do with his creaky old ship and a mutinous crew." The more irresponsible and featherheaded of the Lords wanted to throw out the bill, but what the Lords would do concerned themselves more than it did the Government.

"What our fathers obtained thru centuries of struggle, strife and bloodshed we, will not lightly give up. We are not going to be traitors. The Constitution is to be torn to pieces. Let them realize what they are doing. They are forcing a revolution!"

"The Lords may decree a revolution, but the people will direct it if it is begun, and issues will be raised that are now little dreamed of, the answers to which will be charged with peril for the order of things which the peers represent."

The only stock which had gone down since the introduction of the bill, said the Chancellor, was that in dukes, in which there had been a great slump. A fully equipped duke cost as much to keep up as a couple of Dreadnoughts. So long as dukes were content to be mere idols and preserved that kind of stately silence which became their rank and intelligence, said the Chancellor, all went well. When the budget came, however, they stepped down from their perches because the measure knocked a little gilt off their stage coaches.—Besides the Constitutional question, the effect of the proposed legislation and the present commercial condition of the country will be the important issues. The Conservatives will try to scare the people by alleging that the Liberals are going to lead the country into socialism. The Liberals, on the other hand, will hold up the policy of a tariff as the alternative proposed by the Conservatives to their pending measure. Both parties will appeal to the existence of the large and growing class of unemployed in support of their policy. The need of some remedy for this evil is unfortunately quite too patent. The registers of the Relief Committees in London were opened four days earlier than last year and have recorded 40 per cent. more applications for assistance. If this increase continues the total number of registered unemployed will amount during

the winter to a total of 67,000 men and women. The London County Council and other bodies are making arrangements for the greatest possible extension of labor facilities on public works.

The Irish Question

One of the most important and uncertain issues in the coming Parliamentary campaign in England is Home Rule. The Conservatives accuse the Liberal Government of having exceeded its mandate in the measures which it has adopted tending toward Home Rule as well as in its financial legislation. The Nationalists have voted against the Budget Bill because it increased the tax on Irish whisky, and several times they have by their defection reduced the Governmental majority to a dangerous point, but in the coming campaign the Nationalist forces will be closely allied with the Liberals. Mr. Redmond, leader of the Irish Party in the House of Commons, in appealing for pecuniary assistance in the campaign, has stated the issue from his standpoint in the following words:

"A great crisis in the Irish struggle has arisen. The House of Lords is engaged at this moment in destroying the Irish land bill, with its promise of closing the land war of centuries and completing the restoration of all the land of Ireland to her people and the banishing forever of misery and famine from the west of Ireland.

"General elections are certain within a short time. In these elections the veto of the House of Lords will be at stake, and with the veto of the House of Lords will disappear the last obstacle to Home Rule.

"In this fight Ireland will have arrayed against her all the forces of landlordism, wealth and privilege. Once more we appeal to our race to help us fight against these powerful enemies of our people."

Mr. Winston Churchill, President of the Boards of Trade, in a London speech, declared that the Government would ultimately make such a settlement of the Irish problem as has been made in the case of South Africa. Mr. Augustine Birrell, Chief Secretary for Ireland, in a speech at Bristol, declared that the Irish loan bill, which was "undergoing vivisection in the House of Lords," was really as important as the Budget. He could not imagine, he added, a method of conducting business so absurd, so illogical, so

productive of disorder and so provocative of crime as that now existing in regard to Irish affairs. The time must come and it could not be long delayed when common sense and business principles would relegate all such purely Irish affairs to Ireland, where alone they could be properly understood.—One of the chief opponents of the Irish Land Bill in the upper house was Lord Curzon of Kedleston. He said it was the duty of the Lords to take action on the bill in spite of the threats of Mr. Dillon that if it were seriously modified he would "let slip the dogs of war." The Irish peers and members of the opposition were not taking a partisan view of the question. It was to the interest of every peer to see grow up a strong, solid, solvent peasant proprietary in Ireland. They were all anxious to arrive at a peaceful settlement of agrarian troubles. The proposed legislation concerned England as much as Ireland; more in fact, because English credit was pledged for the money to be raised, which might amount to \$900,000,000. The bill, he said, placed a new and onerous burden on the British taxpayer and reopened the whole land question in response to an agitation of the most unscrupulous and immoral description. It would break up the cattle ranches and establish a new system of small holdings of doubtful economic value, and applicants for which were to indulge in a headlong scrimmage. Those who would be successful would in many cases be people destitute of any knowledge of agriculture, and in some cases of doubtful character. The bill proposed a measure of expropriation of the rights of owners to the soil such as had never been embodied in any measure of any parliament of any civilized country. The Government said to every landlord that he was no longer to be regarded as the owner of the fee simple of his land, but was a mere tenant at will, and might be turned out at any moment, in a congested area by the Board, or in the rest of Ireland by an official sitting in Dublin. Talk about evicted tenants, cried Lord Curzon, why here the Government were taking steps to scatter broadcast over Ireland evicted landlords.—The compulsory purchase clause which Lord Curzon denounced and rejected in the House of Lords by a vote of 114 to 20.

Military Training in Australia

A bill for the defense of the commonwealth was introduced into Parliament by Mr. Cook, Minister of Defense, for the compulsory training of all males, from the age of twelve to twenty. They are divided into three classes—junior cadets, senior cadets and citizen forces. Junior cadets are to have annually 120 hours' physical drill, elementary marching and practice with miniature rifles, for two years. Senior cadets will have 96 hours annually, including four whole-day drills, elementary naval or military exercises, and musketry practice at ranges up to 500 yards, for four years. The citizen forces are to have sixteen whole-day drills or their equivalent annually, including eight days in camp for two years. Those who are to undergo naval, artillery and engineer training will have twenty-five days instead of sixteen. Males from the age of twenty to twenty-six will remain enrolled, attending only one muster parade each year. Persons of other than European descent will be given work as non-combatants. Persons failing to attend the training will be fined \$25 to \$2,500, according to their wealth, or they may be confined until the required drill has been accomplished. Persons failing to reach the required degree of proficiency in the drill will be liable to another year. The bill is expected to involve a cost of \$10,000,000 a year and ultimately to provide for a force of 40,000 junior cadets, 75,000 senior cadets and 55,000 citizen soldiers. Those who show special proficiency in military matters in youth will be admitted to the militia. Mr. Cook, speaking in favor of the Government bill, declared that the time had arrived when Australia should be a buttress and not a burden to the mother country. For this purpose both an army and navy were needed. Australia should provide an armored cruiser, three protected cruisers, six destroyers, three submarines and the necessary auxiliary vessels, with a personnel of 2,300 officers and men. Great Britain, he said, had no battleships in the Pacific Ocean, while Japan had fifteen. Great Britain had four armored cruisers as compared with Japan's twelve and America's eleven. Mr. Cook expressed the belief that the Australian fleet would be the most potent argument for peace.

Hungarian Affairs The coalition cabinet under Dr. Wekerle, which for three and a half years has been successful in maintaining a tolerable degree of peace in the turmoil of Hungarian politics, has at last been compelled to resign on account of the disagreement of the parties supporting it. The Emperor-King will call upon Francis Kossuth, leader of the Independence party, which has a majority in the Hungarian Chamber, to form a ministry. This probably means a renewal of the Magyar agitation for a greater degree of independence of Austrian control. —The treason trials, which have been going on at Agram for seven months, have resulted in the conviction of thirty-one of the accused and the acquittal of twenty-two. None of them were condemned to death, but the two leaders, for whom the public prosecutor demanded capital punishment, were sentenced to twelve years' imprisonment at hard labor. The others received terms of from four to seven years. The reason of the severity of the Government was because the aim of the movement with which the accused were connected was to prevent the annexation of Bosnia and Herzegovina, and to bring the Croats and Montenegrins into a single Serb nation under King Peter of Servia.

Spain and Morocco The Spanish Government besides meeting with unexpectedly strong resistance in Morocco, has been constantly in dread lest its military operations be interrupted by revolution at home or foreign intervention. The danger of the latter was apparently brought very close last week by the publication in the Paris *Matin* of an interview with General d'Amade of the French army, in which he stated that the time would soon come when France must intervene to check Spanish aggression in Morocco. Melilla, he said, was the "Fashoda of Spain," an allusion to the action of England in checking the movement of the French Government for the acquisition of the Sudan. Special weight was given to General d'Amade's words because he was the leader of the French forces in the recent operations against Morocco in the Chaouia regions on the

Atlantic Coast, where, however, he did not have so large a body of troops as General Marina has now at Melilla. The French Government, determined to maintain a strictly neutral attitude on the Moroccan question, at once repudiated General d'Amade's opinions and announced that he must either deny the interview or be punished. Foreign Minister Pichon stated that Spain was acting within her rights in her operations on the Riff Coast, and the questions involved were fully covered by the French-Spanish Agreements of 1904-05 and the Algeciras conference. Spain, he said, was conducting operations in a mountainous region and had need for a large body of troops. It was not the first time that Spain had found it necessary to take such action; for her campaign in Morocco in 1859 she employed more than 40,000 men. General d'Amade, when the question of repudiating the interview was put to him, declared that he could not with honor deny having given utterance to the opinions accredited to him. Accordingly he was placed upon the retired list at half pay, Premier Briand taking occasion to pay a high tribute to his services as an officer. —No progress seems to have been made in the campaign against the Riffians. They are continually receiving reinforcements, probably with the connivance of Sultan Mulai Hafid. No declaration of war between Morocco and Spain has, however, been formally made. Nador and Zeluan, the two points which the Spaniards have recently captured, are being fortified and the railroad connecting them with Melilla reconstructed. Mount Gurugu has been abandoned. —The trial of Prof. Francisco Ferrer as instigator of the Barcelona riot is being carried on by court-martial with open doors. The public prosecutor introduced as evidence numerous quotations from the writings and speeches of Ferrer to show that he was an anarchist and an advocate of the overthrow of government by force and that his Modern School was established for the purpose of training the young in an archistic and atheistic principles. Professor Ferrer in his own defense said that he was solely concerned with education and had as far as possible kept out of politics. He had nothing to do with the riot in Barcelona.

The Alliance Israelite

BY DR. ABRAM S. ISAACS

DURING the stay of the deputation from the Turkish Parliament in Paris in July, they paid a visit to the office of the Alliance Israelite Universelle. Notable among the informal addresses that followed were the remarks of Dr. Riza Tewfik Bey, vice-president of the Chamber and deputy from Adrianople, who said that if any one was capable of appreciating the work of the Alliance in the East, it was himself, for, as a child, he, a Mussulman, had sat at its school in Adrianople side by side with little Jewish comrades. He had learned there not only secular subjects, but also Hebrew, which he spoke as a second mother tongue. He had preserved so grateful a recollection of his first years of study that he continued to be a member of the Association of Old Pupils of the Alliance at Salonica.

What is the Alliance, to whose influ-

ence such public tribute is given by a Young Turk leader? What was its origin, what the story of its development and its present activities?

It was in 1840, when the death of Father Thomas at Damascus gave rise to the charge of ritual murder against the Jews of that city. A deputation of men of the stamp of Sir Moses Montefiore, Adolph Cremieux (later French Minister of Justice), and S. Munk, the Orientalist, went to Egypt, to intercede with its ruler, Mehemet Ali, and check further persecutions. There was no central body in that day to undertake such a work of defense, and the suggestion was then made that an organization be effected, but without result. Nearly two decades later—in 1858—another incident showed the helplessness of the Jewish people. A child, Edgar Mortara, was abducted by the Papal authorities,

THREE AT THE ALLIANCE AGRICULTURAL SCHOOL AT GIBELIN, TUNIS

GIRLS' SCHOOL, CHIRAZ, PERSIA.

and the Pope refused to restore him to his home and parents, despite the remonstrances of the civilized world. An act of such heinousness—for it made every household insecure—deeply stirred public sentiment, and a movement began for organized protection. The Alliance Israélite Universelle, formed in Paris in 1860 by six Frenchmen (Astruc, later chief rabbi of Belgium; Isidore Cohen, an editor; Jules Carvalho, civil engineer; Narcisse Leven, lawyer; Eugene Manuel, professor; and Charles Netter, merchant), was the result. This society, which will soon celebrate its fiftieth anniversary, has developed from the simplest beginnings to the proportions of a modern, widely extended and admirably equipped educational and benevolent organization, which trains 45,000 pupils in its 150 schools thruout the Orient, besides maintaining other forms of useful activity in Europe and the East.

Fifty years ago the condition of the Jews in the Orient was deplorable in the extreme. They had many hostile factors to contend with, economic, political and religious, in the medieval atmosphere which impeded progress and made en-

lightenment impossible. Popular prejudice and governmental extortion, with ecclesiastical bigotry in high places, were hard taskmasters; while such was the effect upon the Jews themselves of long-continued repression and degradation that their moral and physical growth was stunted.

No movement, then, could have been more opportune than that ushered in by the new society, whose task was thus clearly stated in the introductory appeal:

"To defend the honor of the Jewish name, whenever attacked; to encourage by all means at our command the pursuit of useful handicrafts; to combat where necessary the ignorance and vice caused by oppression; to work by the power of persuasion and all the moral influences we possess for the emancipation of our brethren who still suffer under the burden of exceptional legislation; to hasten and solidify complete enfranchisement by the intellectual and moral regeneration of our brethren—such in its chief aspects is the work to which the Alliance Israélite Universelle hereby consecrates itself."

No purpose could have been loftier half a century ago, when the new education was still in its infancy, and the brotherhood of nations and creeds hardly begun to be considered seriously. As

succinctly was the aim of the society defined in its statutes:

"To work everywhere for the emancipation of the Jews. To give effectual support to those who suffer persecution because they are Jews.

of starvation. Since that date, it has secured civic rights to the Jews of Switzerland, helped appreciably in ameliorating the condition of the Jews in Rumania, Bulgaria and Servia, and ob-

THE ALLIANCE NORMAL SCHOOL, AUTEUIL, PARIS.
Where young men, from all countries, are trained for the rabbinate.

To encourage all publications adapted to promote these ends."

It is difficult to condense within a few paragraphs the story of the society's gradual development, how from that initial gathering in Paris in 1860 it has practically encircled the globe, with a genius for organization and accomplishment which no obstacle could discourage, no opposition weaken. Its name indicates its character and scope—it is universal, appealing to all types and classes of Jewry, whatever their predilections and nationality, and reaching out its helping hand to uplift and educate young and old, to champion and protect wherever the Jew is downtrodden in his everlasting heritage of scorn and reproach in benighted lands.

It is significant of the breadth of the founders of the Alliance, whose schools are open to Mohammedan and Christian, that its first public work was in behalf of the Christians of Lebanon, when persecuted by the Druses and in danger

tained a significant declaration in the Treaty of Berlin (1878), guaranteeing civil and religious liberty to the Rumanian Jews—which has not been kept inviolate in the strife and jealousies of the Powers. It has intervened, frequently with good effect, in Russia; appealed with best results in Turkey and other Mohammedan states, like Tunis, Morocco and Persia. It has co-operated wisely and generously with organizations similar to its own in England, Germany, Austria-Hungary and the United States to secure by concerted action the most salutary legislation in countries where medievalism prevails. Its moral suasion has almost invariably been exercised with good effect.

Parallel with what may be termed its political activity runs the strictly educational work, with a breadth and effectiveness that are simply admirable, and stamp the policy of the Alliance as statesmanlike in the highest degree. Fifty years ago the educational facilities in the

East were primitive, and no attempt was made to train the boy in a useful trade, while the girl was wholly neglected. Pauperism was canonized; to be self-supporting and to cherish loftier ambitions almost a heresy. The schools of the Alliance—primary, manual, technical, agricultural—were revolutionary, for their aim was to fit the young people of the Orient to become teachers of their brethren as well as citizens of Western lands. Formerly a mere reading and writing knowledge of Hebrew was demanded of the child; peddling and other lowly occupations formed the only means of subsistence for the great majority. A new life was now to be unfolded and a new resolve cherished. From 1862, when the first school was opened at Tetuan, to

come instructors in the agricultural colonies in Palestine and the Argentine. Visitors to this school speak glowingly of its equipment and training. The second farm school was started in Djedeida, Tunis, in 1895, and has proved similarly successful. At Constantinople a rabbinical seminary has been founded; at Jerusalem a technical school, with its iron foundry, forge, carpentry and machine shops, weaving looms, modeling classes. In Paris a normal school for young men and women is well attended.

The course of studies in the various schools is largely adapted to local requirements, French, Bulgarian, Turkish, Arabic, English, German varying in prominence and attention. Hebrew naturally holds a leading place, with Jewish

LACE-MAKING CLASS AT THE GIRLS' SCHOOL IN JERUSALEM

the one established at Mosul in 1908, 144 have been maintained, covering Bulgaria, Turkey in Europe and in Asia, Egypt, Tunis, Morocco, Algeria, with similar work in Rumania, Persia and Russia. Two farm schools have been established. The first, associated with the name of Charles Netter, was instituted in Jaffa in 1868, upon a grant of 600 acres given by the Sultan, a pioneer in its line, and whose graduates have be-

religion and history, while local geography and history are added to arithmetic, elementary geometry, physics, chemistry and drawing. In the trade schools carpentry, blacksmithing, locksmithing, coppersmithing, metal founding and wood carving are taught. Girls—a marvelous advance for the Orient—have classes in sewing, ironing, confectionery, embroidery, carpet making, manufacture of lace, stockings, shirts, corsets. Even-

ing lectures and courses are maintained for pupils who leave the schools, and these are attended by workmen, merchants and peddlers after the day's labor. "Young Alliance" societies for mutual improvement continue the students' interest after graduation and add in due time to the moral and financial strength of the parent association. The Alliance schools are free only to the children of the very poorest, who are furnished as well with books, clothing and hot mid-day lunch. Parents in better circumstances pay a fee, which reaches often

after a year or two, in their general traits and appearance, do not differ so markedly from the children of the Occident. Two factors are emphasized—love of their ancestral religion and loyalty to the country of their birth, while the vital law of self-help is imprest upon them from the beginning and enforced by the most practical methods.

Minor activities of the Alliance include the publication of bulletins in different languages from time to time, which tell of the works, progress, finances, etc. Subventions are given to

DORMITORY BUILDING
At the Jerusalem Technical School.

20 francs a month. In another respect these schools are praiseworthy—they are open to the young of every religion and attract a fair number of Catholics, Protestants, Greeks, Armenians and Mohammedans. Christians and Mohammedans are on the staff of instructors. Could there be a more suggestive and gratifying sign of enlightenment?

Under such conditions, which promote both the moral and intellectual growth, what a transformation occurs in the child's character and physique! Face, bearing, stature, mind, alike are influenced. The process is rapid and effective; so much so, in fact, that the pupils

scholars for the encouragement of Jewish literature, and books are issued devoted chiefly to Jewish statistics and the defense of Jewish interests. It conducts occasionally "missions" to remote corners of the earth, where are found remnants of Israel, long since detached from the parent stem and yet not wholly beyond restoration. For instance, in 1867, Joseph Halevy was sent to visit the Falashas, in Abyssinia; and within recent years a further mission was dispatched to the same people, which had interesting results and won the favor of King Menelek. Financial relief, too, is given in Russia for educational and

benevolent purposes, while prompt assistance is rendered when communities suffer distress by reason of persecution or other sudden calamity.

The affairs of the Alliance are administered by a central committee resident in Paris and composed of well-known and eminent French Israelites, whose president is Narcisse Leven, one of the original founders. There is, besides, a larger committee of non-resident members, representative Jews from other countries, whose duties are advisory. Local committees in plentiful array cooperate in cities large and small thruout the globe. Annual subscriptions are fixed at a minimum rate of 6 francs, but the income is increased by donations and bequests. For an average year, 1906, the receipts of the central committee were approximately 1,500,000 francs; the expenses about the same. It is largely, if not wholly, due to the gifts of the late Baron and Baroness de Hirsch that the educational work has been so signal-ly successful. Their benevolence was always far-sighted.

It is impossible within present limits to give more than an outline of the society's workings, whose beneficent influence is leaving its undeniable impress for good upon half a million Jews in the East, and whose activities are really only in their introductory stage, for secondary education must receive much closer attention. Its outlook for the future is by no means roseate, and its leaders cannot rest upon their laurels; great tact is required to overcome many difficulties and cope with social, political and religious problems. However, M. Leven and his co-laborers are sanguine, and work only the more energetically and enthusiastically. Each school is not only an "isle of safety" for the young, in an atmosphere still medieval in many quarters, but a preparatory school for enlightened citizenship in Orient and Occident. No wonder that the approaching jubilee—its fiftieth anniversary—will be celebrated with gratitude and rejoicing wherever its work is known and appreciated, and that indicates a world-wide celebration.

Up the Ladder; or, How to Rise

A Fable

BY CHARLES BATTELL LOOMIS

AUTHOR OF "CHEERFUL AMERICANS," "MINERVA'S MANEUVER," ETC.

LAWRENCE OSBORNE, just out of high school and bent on making his way in the world, stood in the doorway of the wholesale dry goods house of White & Moreen, on Worth street, and said to a clerk who was at hand, "Who is the head muckamuck in this business?"

"Mr. White," said the clerk, somewhat shocked at the tone of the boy.

"I wish to see him," said Lawrence, resolutely.

"He is very busy now. Won't some one else do as well?"

"This is a matter of great importance (he added mentally, 'to me'), and I must see him at once."

"Oh, very well. I will take in your card."

"No, you won't, because I haven't one. My name will do no better, as Mr. White does not know me. Take me in myself."

There was something in the tone of the lad which compelled the clerk to usher him into the presence of Mr. White.

That dry goods magnate looked up in surprise, but had no time for words before Lawrence said: "Good afternoon, sir. I wish a position as clerk in this establishment. I will do all my own work and be worth whatever is paid me. My office hours are from 8 in the morning to 6 at night, to begin with. I am willing to begin on a salary of \$5 a week, but I'll soon be worth more than that and shall expect to get it."

There was something in the simple manliness of the boy of eighteen that appealed to Mr. White, and he said:

"That sounds independent. Have you had any experience?"

"Sir," said Lawrence, "experience is something that time will give any fool. I am fresh from school, I am intelligent above the average, and if you make me office boy it will be merely the bottom rung of a ladder up which I intend to

run as quickly as I can. When can I begin work?"

"Right away," said Mr. White, putting out his hand to grasp that of the boy. "Do you smoke?"

"Not during office hours, at any rate, and I don't intend to drink for several years yet. My habits wouldn't interest you. What do you want me to do?"

Mr. White rang for the shipping clerk, and in a few minutes Lawrence was concentrating all his mind on the work in hand.

At the end of the first week he understood his duties so well that he could do them without half trying, but he tried very hard and found that his work was all over at 5 o'clock, so he went at once to Mr. White.

"Mr. White, I am thru my work at 5. Why waste my time staying until 6?"

"Isn't there some other work you can do?" asked Mr. White, secretly amused.

"If I did it would I get paid for it?"

"Why, it is, of course, not our custom to pay extra for work done during office hours."

"Why, then I'd be a fool to work for nothing, and thus save the firm money. When my work is finished I wish to go home."

"All right," said Mr. White; "be sure you do work thoroly, and I'll wink at whatever else you do."

So Lawrence went home at 5, altho other boys who had been with the house two or three years stayed until 6.

At the end of a month Lawrence felt that he could do the work of the boy next above him, and as that boy was going to be discharged for incompetence, Lawrence went in to see Mr. White.

"Mr. White, I can do my own work and that of Smithson for the two salaries. They are going to fire Smithson and I wish to apply for his job. It will keep me until 6 o'clock until I get the hang of it, but don't let that worry you. May I have the job?"

"You may," said Mr. White, without hesitation. He noticed that the boy was handsome and gentlemanly. He also remembered that his daughter was seventeen.

In a month's time Lawrence had mastered his new routine so well that he was going home at 5, and then it was that he noticed that the house did not close at 1 on Saturdays.

He went in to see Mr. White about it.

"Mr. White, I think that a large house like this ought to close on Saturday at 1 o'clock. A man who works when he knows that others are playing cultivates a growth of ill feeling against his employers. On Saturday I can extra concentrate on my work and finish it by 1, and I wish to go home at that hour hereafter. I have nothing to say about the others, of course, but if you don't mind taking advice from a boy, you will let us all out."

Mr. White saw the wisdom of this and invited the boy to go home with him on the following Saturday to meet his daughter.

"For," said he, "I see how it will be. If I put impediments in the way of Lawrence's meeting me socially he will make mincemeat of them at once, and perhaps cause me sleepless nights. I will admit him to social equality at once."

And so the following Saturday Lawrence met Miss White and for the first time in his life he fell in love.

But he was wise enough to see that he was as yet too young to think of love. He merely told Miss White to keep him in remembrance. "I may want to talk to you about something of interest to us both, later on. It would be absurd for me to think of love while getting a beggarly \$15 a week, but there will come a time."

"I believe you," said the girl, and blushed charmingly.

It was early summer when Lawrence entered upon his duties, and by the rules of the house he was entitled to no vacation, but when the weather began to get warm he went to see Mr. White.

"Mr. White," said he, "I understand that newcomers get no vacations. Now, of course, I understand that a vacation

is in the nature of a reward for work performed during the year, but I also know that no vacation renders a man or a boy unfit for work. I must have a vacation in order to be worth my salary, and I should like the first two weeks in July."

"But," said Mr. White, "it is customary to let the older men choose their vacations, and then those who are younger get what's left."

"That is fair enough," said Lawrence; "I had not thought of it in that light. But I am to have two weeks, am I not?"

"Why, we only give one here," said Mr. White, urbanely.

"Then it's time you joined the procession, Mr. White. Two weeks is little enough, when you consider that we work fifty weeks. Is it two weeks for us all after this?"

"I suppose so," said Mr. White, who felt that he could deny the young man nothing.

A busy season now came on and Lawrence found that in order to finish his work each day he had to stay until 7, but the firm did not give supper money unless a clerk stayed until 7:30.

So Lawrence went in to see Mr. White.

"Mr. White, if I stay here overtime to do work that is piled up on me owing to the firm's success, I feel that I ought to be paid for it, but in order to get even supper money I must stay until 7:30, and that is a half hour longer than is necessary. Besides, it is likely to upset my digestion. I am willing to take a dollar for the extra hour, but I cannot do extra work that increases the firm's profits unless I get a share also."

As usual, Mr. White saw the fairness of this, and so supper money was paid at 7 o'clock.

Thus step by step Lawrence rose, asking for what he wanted when he wanted it, and when he was twenty-one he was head salesman, and Miss White was engaged to marry him on a certain date, rain or shine.

When the wedding came off one of the guests was a faithful fellow who had entered the employ of the firm eight years before, and had done his own work and any work that happened to be

undone, in the hope that his patient merit would be rewarded. Instead of which he was called "the goat," and work was piled on him by all. And as it was against his principles to ask for a raise, feeling that if he was entitled to

one he would get it, he was still plodding away on a beggarly \$20 a week, while Lawrence was getting \$5,000 a year.

"Ask and ye shall receive."

LEONIA, N. J.

The Rochester Movement

BY EDWARD J. WARD

SUPERVISOR OF THE ROCHESTER BOARD OF EDUCATION

"I AM more interested in what you are doing, and what it stands for, than in anything else in the world. You are buttressing the foundations of democracy."

It was in No. 14 School Building, in the City of Rochester, that Governor Charles E. Hughes spoke these words. The occasion was a dinner at which were gathered representatives of the League of Civic Clubs, men and women, but mostly men, from every section of the town, of every class and interest, who use the public school buildings for meetings, whose purpose is the development of intelligent public spirit by the open presentation and free discussion of public questions.

When Lincoln J. Steffens first heard of the Rochester movement, he said:

"If that movement is successful it will mark a new era in municipal progress. I have successively pinned my faith to three hopes of salvation for the city. First, I hoped in the leadership of some one man for each town, but I saw that good men weaken and die, and that their ideals do not live forever after them. Next, I thought that salvation of the city would come thru all of the 'good' people banding together and fighting shoulder to shoulder to lift the bad people. But I found that it would not work. The hypocrisy which permeates the ranks of those whom it is conventional to call 'good' people is a real disaster to such movements. Lastly, I come to hope in all the people getting together. I am convinced that it is the only way; not 'good' nor 'bad,' but just people uniting upon common ground for the common interest."

How this ideal of the union of all sorts of people, without regard to class or creed or station, has been realized in the civic club movement in Rochester may be illustrated at every stage of its development. The first men's civic club to be formed was that which uses No. 14

School Building for its meetings. Among the officers of that club were a well-to-do physician, a journeyman printer, a banker and a labor leader. The officers of one of the women's civic clubs are a negress, two Jewesses, two Catholics, a Unitarian and a Presbyterian.

No. 14 School Building, where the civic club movement began, is located in a district which, more than any other, is in the mid-ground of the social life of Rochester. Natives and foreigners, wealthy and poor, people of all sorts, live about it. The movement has extended until there are now seventeen of these civic clubs, and they flourish in every section of the city.

The growth of the civic club movement has been entirely spontaneous, and has been due primarily to the desire on the part of the people of the various communities to find a common ground for the understanding of public questions.

From the beginning there has been absolutely no limitation upon freedom of discussion, and the clubs have uniformly shown a desire to have every question fairly presented from both sides. For instance, at the time of the conviction of Gompers, Mitchell and Morrison, one of the clubs arranged to have a labor leader present the union position. The following evening was given up to the defense of the action of the court by a leading manufacturer. Each of these men came to hear the other speak, and the audience for each meeting represented both classes. In a similar way the saloon question, the question of direct nominations, woman suffrage, newspaper policy, free text books and many others were taken up. The keen interest manifested

in these discussions of public questions is illustrated by a remarkable incident. A seasoned reporter who had been sent to "get" one of the meetings became so much interested that he not only forgot to take notes, but actually rose and took part in the discussion. The city editor of the paper which he represented, when he heard of the incident, expressed incredulity; whereupon the reporter told him that if he had been there, he (the city editor) would have "done the same thing."

The meetings of the clubs are not all of them given up to the discussion of general public topics. Questions of local interest are also threshed out. It was soon after the organization of the first club that the alderman of the ward, who had been invited to speak on "The Duties of an Alderman," responded to the vote of thanks tendered him at the close of his address by saying:

"You have given me a vote of thanks. I feel that I want to give you a vote of thanks for the privilege of speaking to you and hearing your frank discussion of my words. If you have been benefited by my coming here, I have been benefited more. If every member of the Common Council and every other public servant had frequently such opportunities as this to discuss public matters with those to whom he owes his appointment it would mean that we would have much better, more intelligent representation of the people's interest and a cleaner government."

The civic club movement in Rochester is a part of the general use of public school buildings as social centers which this city has begun. Two years ago delegates from eleven organizations, representing more than fifty thousand citizens of Rochester, united in "The School Extension Committee," and asked for an appropriation for equipping one school

building with gymnasium, baths, library, game and reading rooms, and keeping it open every evening for the use of the people of the community, three evenings of each week for the men and boys, two evenings for the women and girls, and one evening for an entertainment, followed by a social hour for all together.

The experiment the first year was regarded as so successful that the appropriation the second year was doubled and three buildings were equipped and opened.

From the beginning there was no "charity" nor "uplift" idea in the usual sense connected with it. It was, to use the phrase of a citizen, spoken on the night of the opening of the first social center, simply a means of the "people's

getting their money's worth out of their own property." It is in this common sense, democratic spirit of social exchange that the success of the movement lies.

The most remarkable and satisfactory thing about the movement in Rochester is the fact that while the recreational and entertainment features have been limited to the social centers, the adult civic club movement, especially of men's organizations, has spread beyond the bounds of the social centers to include every section.

This is the feature that impressed Governor Hughes, this demonstration of the fact that people are eager to come together for open, frank discussion and that when the restrictions are removed and the idea of one group of people lifting another group or teaching another group is absent, men are just as ready to meet in the great school buildings in the city as they were in "the little red school house back home."

ROCHESTER, N. Y.

THE EMBLEM OF THE ROCHESTER MOVEMENT.

The Game and the Farmer

BY DWIGHT W. HUNTINGTON

[Our readers will not forget the series of articles we published recently from the pen of Mr. Huntington advocating a revolutionary policy on the part of all our States to make the game plentiful once more. These articles have accomplished much good and we are glad to continue the discussion now at the opening of the game season, when so many sportsmen are turning their steps to the fields and woods. Mr. Huntington has become since our series was completed editor of *The Amateur Sportsman*.—EDITOR.]

IN the article on "The State and the Game" I pointed out the weakness of the North American game laws and the scientific reason why restrictive laws cannot be made to increase our game.

The farmers seem to have been entirely overlooked in our game law making, save that there has been some attempt to add to the ordinary trespass laws certain provisions making it a misdemeanor to shoot on lands which are posted. These laws are of little value, because usually they require that the signs prohibiting shooting be of a certain dimension and that they be placed at certain intervals; the criminal laws are construed strictly in favor of the accused, and failure exactly to comply with the terms of the statutes makes the posting of no value to the farmer.

It is, too, a matter of some expense (for which there is no return, since game cannot be sold) to procure and properly place the sign boards, and when they are up often they are disregarded in the absence of a gamekeeper, by a lawless class of gunners, who know that the farms are large and that they can easily make their escape if any one is seen to approach. A game warden who must guard 300 square miles is not much to be feared.

Poultney Bigelow, writing of the city man in the country, said recently:

"He may plant an orchard; he may wish to preserve fish in his stream or birds in his woods. He will discover that in the absence of any effective game or highway policing he will be only planting that which others appropriate."

The statement is applicable to the farmer as well as to the city man.

The worst feature of the game laws from the farmers' viewpoint, however, is that they restrict and in fact prevent the profitable increase of game.

Having adopted an English legal fiction that the title to the game is in the Crown and having taken it seriously to mean that the State owns the game, the State has attempted to save the property by enacting a large number of criminal laws (as was pointed out in the paper referred to), the effect of which is to prohibit the taking of game, except in very small quantities and during a very short season, which makes it not worth while for any one to look after it properly. The State cannot do this, and it prevents the farmers from looking after the game, since no one can be expected to do anything which does not pay.

The laws prohibiting the sale of game alive for propagation, or as food in the markets, deprive the farmers of the right to profit by an interesting crop, easily produced, and the license system permitting the sportsman to shoot seems to emphasize the fact that the State is preserving the game for sport and not for food. The farmer is given to understand that the sportsmen only have an interest in the game; that they can shoot it; but that the farmer must not rear it as an additional crop, which would prove in many cases more profitable than anything he can produce on the farm. It seems almost ludicrous for the State to issue licenses to pursue game on the farmers' lands; an Illinois sportsman recently complained that the State had sold him a gold brick—a license to shoot on some posted farms.

In the paper on "How to Preserve Bobwhite" I pointed out that it is an easy matter to make the partridges or "quail" profitably plentiful on any farm. The bobwhites require very little feeding, even when they are abundant, and they sold last season for \$15 per dozen alive, and for \$6 and up per dozen in the markets, in places where they could be sold; but most of the birds marketed

¹THE INDEPENDENT, September 10, 1907.

²THE INDEPENDENT, June 3, 1909.

³THE INDEPENDENT, October, 1907.

were taken in one State and sold in another in violation of the statute of the State where the birds were procured and also in violation of the United States statute known as the Lacey Law, which prohibits interstate commerce in and the transportation of game illegally taken.

The farmers being a law-abiding class (undoubtedly in many ways they are the best class of American citizens) have not, of course, profited in any way by the game sold, save perhaps that it may be an advantage to them to have the game taken so as to remove temptation from the trespassers (licensed by the State to overrun the farms), who often destroy fences, fail to close gates and sometimes even shoot poultry and other live stock.

The amount of game sold is very small. The amount of game that could be sold, at high prices, by the farmers under proper regulation is tremendous. New York alone would send many hundreds of thousands of dollars annually to the farms provided the industry of game rearing was permitted and understood, and the other cities and towns would contribute proportionate amounts.

The Biological Survey of the United States Agricultural Department has issued some able and elaborate bulletins on the food habits of the wild turkeys, grouse, partridges and other upland game birds intended for the use of the farmers, but these bulletins have been of very little value, since the farmers cannot take advantage of the information contained in them, so long as it is legally impossible for any one to profit by the game crop. In most places the farmers cannot even rent the shooting rights on the farms by reason of the short season and bag limit laws and the tendency (as the game vanishes) to prohibit the taking or shooting of various species of game at all times. The laws make the shooting not worth renting.

In all countries where the sale of game is permitted by the farmers and their shooting tenants, the farmers profit largely, and there are many records of land values having been increased many times over within the space of a few years by the introduction or restoration of game, which, of course, is properly looked after. In Scotland, for example,

lands are now rented annually on account of the red grouse for more than they were worth a few years ago. As I have pointed out at other times, these large rentals are largely due to the payments made by American sportsmen who have been driven abroad to shoot by reason of our restrictive game laws. This money should go to the American farmer.

Our prairie grouse and sharp-tailed grouse are fully as good birds both for the gun and the table as the red grouse of Scotland, and there seems to be no good reason why the money which now goes abroad should not go to the farmers of the Northwest, where enough grouse still occur to make their restoration and increase an easy matter. A few years hence it will be too late, since the grouse are vanishing rapidly.

Altho hundreds of thousands of game eggs are sold in England every year, the price of game eggs is still much higher than the price of poultry eggs. Wild duck and other game eggs are far more valuable in the United States than they are in England, and last year a man I know sold all the eggs he could produce at \$25 per hundred or twenty-five cents per egg. There are grave doubts if such sales are legal, or even if it is lawful to have the "State" ducks which hatched the eggs in possession, but he did it, nevertheless, and many farmers could do the same provided the laws permitted those who rear wild ducks from the eggs to make the best use of them.

A most important error was committed in our game legislation when the farmers' interests were overlooked; the natural effect of the error, the rapid diminution of our game, is apparent to all who are familiar with the subject.

No one can be expected to devote a part of his land to the briar and grass patches, the natural cover and feeding places for game birds, or to properly look after them when the result of so doing is to invite licensed trespassers to enter and shoot without even saying "By your leave."

The effect of the article on "The State and the Game" was remarkably good; it was much quoted, and the two leading sporting magazines in America

republished it entire.⁴ The errors in our game law system were thus made known to a wide and varied circle of readers.

Shortly after the publication of the article the United States Agricultural Department issued a bulletin on "deer farming," in which Mr. Lantz said:

"The chief obstacle to the profitable propagation of deer in the United States is the restrictive character of the State laws governing the killing, sale and transportation of game. . . . Instead of hampering breeders by restrictions, as at present, State laws should be so modified as to encourage the raising of deer, elk and other animals as a source of profit to the individual and to the State."

This bulletin is directly in line with the ideas advanced in the "State and the Game" and the other papers on game preserving in THE INDEPENDENT.

Many prominent naturalists and lawyers who have looked at our game legislation with trained eyes (since the folly of our game law system was pointed out) have declared in favor of a breeders' law permitting the farmers and their shooting tenants to make the game profitably plentiful.

Dr. C. Hart Merriam, chief of the Biological Survey of the United States Department of Agriculture, in a letter to the writer, says:

"I am heartily in favor of laws permitting any one to raise deer, elk, grouse, quail or any other kinds of game on private lands for profit just as cattle, sheep and domestic poultry are now raised for profit. Furthermore, I believe the industry of raising game for food is worthy of development by our people, to whom it should yield an important revenue. It is an industry which can be carried on by persons of small means and may be made to utilize much land which is now wholly waste land or of very little value. . . . I feel very strongly that the game laws of our various States should be so modified as to encourage the raising of game animals and birds for food."

Dr. Hornaday, in a recent bulletin, reprinted in *The Amateur Sportsman*, says:

"We believe that every owner of a private game preserve is entitled to the right to kill the game that he owns and maintains whenever he pleases, provided such killing do not interfere with the execution of laws for the protection of game and other wild life outside of private preserves. We believe this is not only good law but good common sense. The situation is absurd and therefore cannot long endure. The raising of deer or pheasants on small land tracts in fenced enclosures for the market should now be placed on the basis of a legitimate industry."

The Breeders' Association, of which Mr. Wilson, the United States Secretary of Agriculture, is the president, at its annual meeting passed the following resolution:

"Resolved, That State laws regulating the shooting, possession and handling of game should be amended so as to permit the sale of live game for propagation at all times; that hand-reared game and game reared in a wild state by breeders (including farmers) should be distinguished by law so that such preserved game can be sold legally under State regulation except during the breeding season."

The necessity for changes in the game laws has been under discussion in many States and in some of the Provinces of Canada. At a recent meeting of the Saskatchewan Fish and Game Protective Association, the general opinion was expressed:

"Native birds hovering over cultivated lands owned by private parties cannot be controlled by Government. If fish are only in public waters it is considered that the quantity will decrease more rapidly."

The ideas entertained by the organizations of sportsmen, known as game protective associations, that the State owns the game on the farms as a trustee for the sportsmen alone; that "it is a crime to sell game," and that none of the people should have any of "their" property, has naturally carried the game into politics and it is now "protected" by political machines in many of the States.

Altho millions of dollars are collected annually to support an army of politicians, the indigenous game entrusted to their care continues to decrease steadily where any shooting is permitted, and the attempts to substitute foreign fowls (protected by laws prohibiting the shooting of them for terms of years) have increased nearly everywhere. Here again we may observe that hundreds of thousands of dollars are sent abroad annually, not only by the State game officers but by individuals, in payment for pheasants, partridges and other game. All of this money should go to the American farmers, since it would be an easy matter to rear better game birds on the farms than any of those purchased abroad.

Prior to the publication of the paper on "The State and the Game" and the other articles on game preserving which

⁴*Red and Gun in Canada.*

followed it in *THE INDEPENDENT*, the sale of game was denounced by *Outing* and the other sporting magazines, and the individual care of game was almost unheard of. Since the publication of the series of papers referred to, many capable State game officers have declared in favor of the sale of game and of the changes in the laws there suggested. Many game increase associations have been organized which deal with the farmers, and some of these already produce thousands of game birds yearly.*

In their last report, the Commissioners of Fish and Game of Minnesota say:

"The propagation of game birds and animals and food fishes as private enterprise, may well be encouraged. The law now permits the private propagation of brook trout and deer, *and the sale thereof* from such preserves. The commission believes *such privilege might properly be extended to all varieties of game and fish* under proper restrictions. The privilege of sale from such preserves would be an incentive to private enterprise and would tend to remove the present temptations to engage in illicit traffic in game, and would discourage the business of the market hunter, who has always been and is yet a serious menace to wild game. The possibility of purchase from private preserves would also remove the objections now held by some to the non-sale of wild game."

The Minnesota board is non-partisan and is one of the best in the country.

Mr. Thomas, the Game Commissioner of Vermont, said in his report:

"If our native game birds could be made to increase thru intelligent and proper methods it would be a step in the right direction of augmenting the attraction of newer Vermont *by supplying our markets* and, in time, if successful, would eliminate from our laws some disagreeable restrictions *which cannot be enforced.*"

Readers of *THE INDEPENDENT* will recall that much space was given in the series of articles on game preserving to a discussion of the prejudice against preserves. Recently the State Game Commissioner of Colorado said:

"It is absurd to argue against game preserves and private lakes for fish. The bigger the preserves the better, is my opinion."

It would have required a brave man to have said this before the publication of the articles in *THE INDEPENDENT*.

The chairman of the Massachusetts Game Commission served with the writer on the committee on wild food

birds of the Breeders' Association, which passed the resolution favoring the breeders (including farmers) quoted above. Massachusetts has since enacted a law permitting the sale of pheasants from preserves. Wisconsin has a bill permitting the rearing of deer and the sale of venison. North Dakota has just passed a law encouraging the increase of all game and permitting the sale of it by breeders.

Since game law making seems to be contagious, as I pointed out, it seems evident that it will not be long before good sense laws will be enacted in many States. Statesmanlike game officers, who wish to see the game increased, have found no fault with the plain statement of facts in *THE INDEPENDENT*. They know the necessity for encouraging the farmers and sensible sportsmen to undertake the care and management of the game. All agree, of course, that the sale of game should be regulated so that stolen game and game taken on public lands or in public parks cannot be sold. The political game officers who regard an army of politicians as of primary importance are not heard from, and the chances are they will not be when the farmers fully understand the situation.

There is no subject which is more important to the farmers than the practical increase of game, since it will send much money to the farms and will rapidly increase their value. The farmers should take advantage of the situation. With the aid of many intelligent sportsmen and naturalists they should bring about, easily, the needed changes in the laws, permitting them to control and sell game. The exclusive handling of the game by politicians and sportsmen has not been successful for the reason that those who should own the game have not been consulted. The State game officers, as I have often said, are required to perform an impossibility.¹

The needed changes in the game laws should be discussed at every grange meeting in the land.

YONKERS, N. Y.

¹See statement of Vermont game officer, quoted above, "Would eliminate from our laws some disagreeable restrictions which cannot be enforced." Mr. Thomas is one of the most capable game officers and was among the first to concede that the State is required to perform an impossibility.

*One in Connecticut reports that it will rear 10,000 birds this season.

The Budget Battle at Westminster

BY JUSTIN McCARTHY

THE North Pole has suddenly succeeded in dividing the public attention of Britain with Mr. Lloyd-George's budget. Geography has thus become a rival with arithmetic. Pillars of ice are, to say the least of it, holding their own against columns of figures. Commander Peary and Dr. Cook are now rivals who dispute our interest here with Mr. Asquith and Mr. Balfour. It has perhaps been something of a relief to many of us to find a new subject of eager argument and animated conversation brought up to relieve us from the one prevailing topic of the new taxation.

The discovery of the North Pole had for a long time ceased to be one of England's fervid expectations. Of course, it was always coming up at intervals, and has been for time out of mind a subject of expectation, hope and controversy to succeeding generations. But of late years it has somehow faded out of our hopes, and now once again it has quickened into quite a new life among us, and Mr. Lloyd-George may fairly be congratulated on the fact that there is even still some degree of public attention given to him and his budget. "Two stars," Shakespeare tells us, "keep not their motions in one sphere, nor can one England brook a double reign of Harry Percy and the Prince of Wales." But there is no way of bringing the controversy between the North Pole and the budget to so sudden and definite an end as that between Harry Percy and the Prince of Wales, and the more moderate in the disputation must only do their best to maintain something like equity in their valuation of either subject.

The general public opinion of England, so far as I can estimate it, appears to be in favor of Commander Peary's claim to be the first discoverer, but I am assured by many observers who know much more about the whole question than I can pretend to do that before making up our minds we must wait for some further evidence and some further

study of the whole question by those best qualified to offer an authoritative opinion. A fanciful friend of mine, who has been much interested in the whole question, but who does not pretend to have any qualification for offering an opinion, tells me that it has suggested to him a new and entirely original way of illustrating the subject. He has conjured up out of his imagination an entirely new candidate for the honor of having discovered the North Pole. This personage had been in his earlier days a great traveler and explorer, and was the very, very first to find the North Pole and on it he planted the national banner of Great Britain, with his own name and residence appended. Then he went on to other wanderings and made other discoveries, and at last he came home tired of travel, settled down to a life of abso-

LORD ROSEBERY.

lute seclusion in England, became affected by ill health, and entirely forgot that he had ever seen the North Pole. His health, however, had been lately returning, and the sudden commotion caused by Commander Peary and Dr. Cook brought the whole event freshly back to his mind, and he now proposes to claim the honor of having discovered the North Pole before either Commander Peary or Dr. Cook professes to have ever gone out in quest of the mysterious region. The best claim, he declares, that

COL. ARTHUR LYNCH.

GEORGE MANVILLE FENN.

either of those explorers can set up for the honor of the discovery will consist, in fact, that by the excitement which they have just been creating they brought back to his memory his forgotten exploit and thus discovered him and with him his original discovery of the Pole. I give this freak of imagination for what it is worth, to use a familiar journalistic phrase. The inventor of the story does not himself consider it worth much, but only thinks it might be accepted as an interesting illustration of an entirely new claim and claimant in this

great question coming up periodically for settlement.

Mr. Asquith, our Prime Minister, has lately been coming in for some fresh experiences of a peculiarly disagreeable nature at the hands of the suffragets. My American readers already know that he has been several times before this pursued into his official home by those who I may perhaps be allowed to call the more active feminine representatives of woman's right to vote. He has had to be protected by the police when endeavoring to make his entrance into the House of Commons against the attempts of some of these ladies to interfere with his progress and to enforce upon him the rights of women to be the equals of man in the matter of electoral suffrage. Most lately, however, he has been assailed by ladies, one of whom, we read, endeavored to impress him with her views as to woman's rights by striking him several times on the face, while others on the same purpose bent actually climbed over the walls of a demesne on the seaside

where he was dining and actually set about forcing their way into the dining-room and there confronting him and the company with their demand for woman's admission to the franchise.

Now, we all know that history is full of hostile attacks made on Prime Ministers, and even with attempts sometimes successful on the lives of these statesmen, but it is something certainly quite new in political biography to hear of a Prime Minister having his ears publicly boxed by feminine hands and his dinner table besieged by feminine and unprofessional housebreakers. Now, Mr. Asquith has undoubtedly accomplished thus far a most successful career. Without the help of ancestral claims or of great aristocratic family and entirely by his own political capacity and brilliant eloquence, he has risen from being merely a successful advocate at the bar to hold the highest political office in Britain's parliamentary system. With such success achieved, he may well consent to put up with the attempts made to frighten him into compliance with their demands by those self-elected and merely self-representing advocates of the really substantial and just cause of woman's right to vote.

The Government of which Mr. Asquith is the leader has just lately been descended upon by a hostile assailant of a somewhat more formidable character than any of the Amazonian champions of the woman's suffrage cause could be expected to prove. This opponent is Lord Rosebery, who has just made one of his periodical appearances, or perhaps I might even say his apparitions, at a great public meeting in Glasgow, with the object of denouncing Mr. Lloyd-George's financial scheme and indeed the general policy of the present administration. We had been expecting Lord Rosebery for a long time past to come to the front somewhere and denounce the doings of this Government. Lord Rosebery is never really himself unless when he is denouncing some government or other, and of course he has to denounce a Liberal Government when there is no other government in office to come within the scope of his denunciation. Lord Rosebery has served in Liberal administrations and has actually

himself been a Liberal Prime Minister. But those were the days when he was still thought to be one of the rising hopes of the Liberal party, and he had not begun to fancy that the Liberals were growing tired of him and they had not begun to fancy that he was growing tired of the Liberals.

Lord Rosebery is unquestionably a man of great and varied talents, and he has a genuine gift of brilliant eloquence which it is impossible for any intelligent and impartial listener not to admire. But then he seems also somehow to impress the intelligent and impartial listener with the feeling that one never can tell how long the noble lord may hold the same opinion on any debatable subject, or may continue to believe that the cause he is now pleading is still deserving of his support. He is, I must say, a man who is personally admired by every one who knows him because of his generous nature, his public and private beneficence, and his charming manners. But he has never, to my thinking, come to hold the public position which his many great gifts ought to have won for him, and I do not think that his recent speech in Glasgow has done much to help the peers or the Conservatives in their opposition to the main provisions of the budget. The truth is that the peers have brought themselves now to a crisis, or perhaps it might be more correct to say, have brought a crisis on themselves, out of which it is hardly possible to get except by a complete surrender or encountering all the risks of a hopeless struggle. Even Lord Rosebery does not go so far as to advise the peers to venture on the path of resistance to the death, and so the hereditary chamber remains in much the same condition as that which it exhibited to the public when the coming of the Glasgow apparition was foreshadowed.

My countrymen thruout the United States and Canada will be glad to learn of the recognition just now given to several distinguished Irishmen in England as well as in Ireland. The first of these whom I have to mention as a recipient of such a national testimonial is Mr. John Ryan, who has been influential in the promotion of every Irish national movement among his country-

men in London for more than forty years. Mr. Ryan has been for many years president of the Metropolitan Branch of the United Irish League. The recent presentation took the form of a portrait of Mr. Ryan, painted by Mr. J. R. Cooper, and the testimonial was presented by Mr. John Dillon and was accompanied by numbers of letters expressive of sympathy and admiration from a large number of influential Irish Nationalists having their homes in various parts of the world. Another occasion of many enthusiastic demonstrations of national welcome has been given by a visit of Mr. Redmond, the leader of the Irish Parliamentary party, to various parts of Ireland, in companionship with his friends and guests, Captain O'Meagher Condon and Mr. John O'Callaghan. These latter gentlemen have come to look again upon their native land after many years of prosperity and influence among the Irish in America. Then again we must remember that Col. Arthur Lynch has been returned unopposed as the National representative of West Clare to the House of Commons, and returned not for the first time. It may be remembered that some years ago Colonel Lynch was elected an Irish National representative in that House, but he was then actually under sentence of death for high treason, committed by his service rendered to the Boer cause when he bore arms on behalf of the South African movement against the military power of England. With that cause, it is well to remember, a large number of enlightened Englishmen even then felt strong sympathy, and with it the whole civilized world is in sympathy now. Colonel Lynch being under sentence of death, could not then be received as a member of the House of Commons, but he soon obtained unsolicited a mitigation of his sentence, which was modified in the first instance to one of imprisonment for life, and afterward became a complete release from penalty. Colonel Lynch is now, therefore, an elected member of the House of Commons, and will find many sincere friends and admirers in that House even outside the

ranks of those who belong to his own land and maintain his own national opinions.

Many American readers will, I am sure, have heard with much regret that George Manville Fenn, the English novelist, has passed out of this life. Fenn was a dear old friend of mine during a great part of my working lifetime, and he was one of the most diligent and unwearying writers of novels and short stories it has ever been my fortune to know, even among a very large circle of friends and acquaintances who devote their lives to the production and promotion of such literature. His books were especial favorites among young people of both sexes, but they had also a very large number of cordial admirers among the elders. I made his acquaintance at a very early stage in literature and journalism in London, and we formed a friendship which, with whatever interruptions, lived in its warmth thru his life and will continue to live in my memory after his death. He was certainly not in any sense to be classed among fashionable novel writers. His lines, to use the word in whatever sense, were certainly not cast for the regions of fashion, and he always wrote with a healthful purpose to encourage, stimulate and sustain the rising youth of the country. Manville Fenn wrote for various newspapers and periodicals, and edited himself more than one weekly publication. He was a member of many literary clubs and journalistic associations in London, and wherever he went he made himself always a genial and welcome companion. My earliest associations with him began. I think, with the dear old *Morning Star*, the organ of the Cobden and Bright party, to which he was an occasional contributor. I do not, however, associate him in any sense with political life or political work, altho I have no doubt he had his political creed as well as most other men, but he was a born storyteller, and he worked ever in his own path of life. The work which he especially desired to accomplish he accomplished with credit and with honor.

LONDON, ENGLAND

A Wooden Airship

BY MAX A. R. BRÜNNER

IF we follow the history of aeronautics we come across rather curious designs, especially in the earlier models. The accompanying pictures, however, show a new type of airship which will probably be adopted by Germany. That country is admittedly leading as regards navigable airships, as she owns the largest and fastest, including three Zeppelins, two Parsevals, the Gross military cruiser, and others. To this field belongs also the invention to be described herewith.

Its main feature is that for the first time no metal is employed for the stiff frame. The specific gravity of Canadian pine is only one-eighth that of aluminum. However, as the strength is only one-third, it would have to be three times as thick. Yet, in spite of the latter

fact, the weight is about two-thirds less at the same strength. It is clear, therefore, that, considering such a huge size, enormous weight can be saved. In the "Zeppelin II," with 1,500 cubic meters,

the dead load of the aluminum frame is 10,000 kilograms, which would mean a saving of 3,300 kilograms if wood were substituted for metal. This would result in greater lifting power and more fuel, and passengers, or a larger engine could be carried. Such an airship would increase its speed, radius of action and capac-

ity if used as a medium of traffic.

There are other advantages. If wood is painted with a weatherproof coat it cannot be affected by heat, cold and moisture, while aluminum or other metals oxidize and lose their strength. It

FIRST BALLOON WITH
WOODEN FRAME.

WOODEN SKELETON

WOODEN AIRSHIP FRAME.

can also be repaired anywhere without many tools or skilled carpenters, while a complicated aluminum ship requires special apparatus and the experts available only in larger cities. This point may lead in war to fatal consequences, and the German military authorities, while inspecting this model, laid special stress upon this fact. The frame has the shape of an ellipse, and we know that this is the best for a body horizontally placed and loaded. For in the middle the bending moment is greatest, and a cylindrical form like the Zeppelins is apt to be bent or broken in the center, as the diameter is alike, while here is the greatest pressure in the middle. Thus we can use one car, passengers and engines being at one central point, while all the Zeppelin ships have two cars to distribute the load, which are 200 feet apart. This increases the dead load and minimizes the maneuvering ability. This shape also withstands in a much better way shocks and offers less air resistance; it also gives less surface, the volume being the same. The meshes are here much smaller than in the Zeppelin ships, and the

inner gas pressure may thus become greater without fear of the envelope being torn. Such an airship can, in spite of sunshine and its increased pressure, remain longer in the air and store more gas.

The main advantage, however, which was the incentive for this invention, is the non-conductivity of wood for electricity. When the huge, beautiful "Zeppelin II" exploded last year in a thunderstorm, experts began wondering what could have caused the disaster. It was asserted that the enormous mass of the metal frame had attracted atmospheric electricity and conducted it to the gas, where a spark exploded it. A wooden balloon is comparatively safe in a thunderstorm, and electricity is neither conducted nor generated by friction with the envelope. After several models of this novel type have been built, new, larger airships will be started. In the two photographs herewith reproduced the model is 20 meters in length and 2½ high. It was sent to the recent Frankfurt aeronautical exhibition, where it attracted much attention.

BERLIN, GERMANY.

May-Tide

A Threnody of Life and Death

BY HENRY B. TIERNEY

IN the spring of the year
Hearts sing of thee, dear,
All the world far and near
Is glad.

Oh the fall of the year
Brings the fall of the tear—
Man's soul, dark and drear,
Is sad.

For the fall of the year
And the fall of the tear
Are the gall and the fear,
Yea, the pall and the bier
Of the dead.

TRENTON, Mo.

The Way of Wisdom

BY BOLTON HALL

AUTHOR OF "THINGS AS THEY ARE," "THREE ACRES AND LIBERTY," ETC.

A CERTAIN man having found a precious pearl feasted his eyes upon it, and when he could look no longer he hid the pearl in his bosom (a man was void of understanding).

But each time that he looked at it in secret it seemed to grow dimmer and dimmer; and he was sad. Then the man thought that it had only seemed to be bright because it was new.

So he showed it to a merchant, and the merchant said that it was a pearl, but of no great value (for that is the way of merchants). Nevertheless the merchant bought it, and the man went away sorrowing.

But as he looked at the ground, behold! again a pearl, more lustrous than the other.

So he hid that also in his bosom, but, like the other, it grew duller and duller. Then, wondering, he showed it to his friend, and the friend said that it was indeed a gem; but it seemed not so to the man (for his eyes were holden); so he gave the pearl to his friend and again went sadly away.

But as he looked upon his doublet, he found in it once more a pearl brighter and larger than before.

Again he hid the pearl (the man was a foolish man) and it also grew dim and shrank. Then he gave it to his servant. The servant said it was a ransom for a king, and the man went away sad.

But as he stroked his beard, lo! a pearl again in his hand, and this time it shone like a star.

Once more he hid the pearl (he had learned naught), but as before it lost its light. Then he gave it to a beggar, and the beggar exclaimed that its brightness put out the sun. The man could not understand.

The man went out, and, as he put his hand to his mouth, again in his fingers he held a pearl.

This time he said, "I will give it away while it is bright"; but as often as he gave he found another, and each was more beautiful and precious than before.

The man understood.

NEW YORK CITY.

Dangers of the High-School Age

BY E. V. BRUMBAUGH

THE high-school age can scarcely be defined as any particular age. It ranges from twelve to twenty-one; it differs in boys and in girls. In the particular school of 400 pupils with which the writer of this paper is the most familiar the average age of the various classes on the 1st of last September was as follows: First year, 14 years, 8 months; second year, 15 years, 8 months; third year, 16 years, 8 months; fourth year, 17 years, 5 months; fifth year, 18 years, 2 months.

It may, therefore, be assumed that pupils enter the high school at the age of fourteen or fifteen and leave at the age of eighteen or nineteen, for, of course, to the entering age in September we must add the nine months that elapse before the year ends.

It is a fact easily noticeable that there is a difference in the ages of the boys and girls in the same classes, both entering, leaving, and thruout the courses. During the present year in this school the ages were as follows:

Year.	Boys.	Girls.	No. in class.
1 ..14 years, 11 months.		14 years, 6 months.	136
2 ..15 " 11 "	11 "	15 " 6 "	94
3 ..17 " 0 "	0 "	16 " 5 "	71
4 ..16 " 8 "	8 "	17 " 10 "	35
5 ..18 " 8 "	8 "	18 " 1 "	27

From the preceding table, it will be seen, therefore, that with the single exception of one grade the age of the boys is about six months greater on the average than that of the girls of the same grade.

It is to be particularly noticed that the leaving time of 35 per cent. of the pupils is before entering the second year or at the age of approximately fifteen

and one-half years, while an additional 35 per cent. have left before ready for entrance on the fourth year at an age between sixteen and seventeen.

To find the reason for so large losses is a matter of great difficulty and one which has for many years occupied the attention of school men. Perhaps one of the reasons that accounts for a large number of losses at the close of the first grade year is the fact that this serves as a kind of sifting year, where those who have proved themselves unfit discover that fact or have it discovered for them.

This unfitness may be the result of a large number of causes. It may be due to mental incapacity (this applies to only a very small number of those who gain entrance in the high school); it may be due to mental or physical indolence; it may be due to physical ill health, to improper home discipline, to improper companionship, to the change from the grammar school, and the increased freedom from restraint that is met in the school, or it may result from the fact that the pupil now is under the direction of four or five teachers instead of but one. During this first year there is not so great a difference in the relative number of boys and of girls that leave the school, but in the next period, *i. e.*, at the close of the third grade, the loss of boys is noticeably greater than that of the girls. A new set of conditions enters here. The boy is passing thru the most critical period of adolescence, which the girl has already safely weathered. This is a period of storm and stress, in which the youth is the most difficult to manage. During this time there is a disinclination to work,

a period of group loyalty, a time when there is a strong desire to be recognized as a man, and to be taking a part in the outside business life, while there is at the same time a total lack of recognition of his unpreparedness for such activity. This is the most critical time in the whole course. If the pupil can be carried into the next year of his work the chances are ten to one that he will stay thru.

The girls remain in school longer because of the fact that while they are younger in years, their maturity is greater, and they are more ready to accept advice. Their faithfulness in work is stronger and thus they are less exposed to danger of failure. They do not feel the immediate need of earning the money that they spend, nor the pressure to be at work. The majority of them have not had the experience of work during their long vacation, where they had received a weekly wage, and so do not feel the deprivation of it on re-entering school, nor are they so greatly subject to the solicitation of their companions out of school and by opportunities to engage in remunerative work, that they are unrestful and ready to leave their occupation. On account of these reasons the percentage of girls remaining in school is constantly increasing while the boys decline in numbers. The danger to the boy, therefore, is a constantly increasing one that he will not remain in school to complete his course.

Certain general dangers and temptations beset every boy and every girl of the high school age. These may be classified as general temptations of the adolescent age. They have been hinted at in what has preceded in this discussion. An increased and growing sense of maturity carries with it an impatience of restraint, but which because of its ignorance must be restrained. A growing lack of confidence, or rather of confiding in parents and a steady hero worship, usually for some older boy or girl, and which may be fraught with either good or evil. These young people are now accepted as young men and young women. They arrogate to themselves all the privileges of youth, and often ignorantly they are carried beyond their depth and are left to struggle in waters that are deep and bitter. These are factors that meet every

boy and every girl some time in their life, whether they attend the high school or not. They must have sufficient strength to meet and overcome them, but in addition to these features, or perhaps as particular manifestations of them, there are certain points where our high-school pupil must overcome certain obstacles different from those of the pupil who does not enter or who leaves early in the course.

The first of these was discussed a moment ago, viz., that he may never finish his course and thus leave half completed that which was begun so well. This is particularly the danger that besets a boy. He also is likely to be beset by bad companionship, but here in the high school, among a select group, he is likely to be safer than among companions promiscuously chosen. But the greatest danger for this time is in a lack of kind but firm and definite control. The intentions of the average boy in high school are of the best generally, and he desires to do only that which is good and right, but his will power during this adolescent age is lacking in strength and firmness, and to an extent of which the parent who has not made a careful and painstaking study of the psychology of adolescents is totally unaware. This lack of will power is not a permanent weakness, but is one manifestation of the period of stress and storm that surrounds **every boy of this age and must be recognized and provided for by adequate recognition of the need of extraneous aid to the boy in keeping a firm hold on his strength of will and of character.** This is the time in a boy's life when he can be made a law-abiding citizen, ready to support all that is best in civic life, by being taught to recognize and submit to law and discipline, and at this time, thru unwise control, he can be taught that there is nothing in law that can bind him to curb his own wishes and desires.

This is especially the danger that meets the boy of this period, and is particularly a danger to which a high-school boy is exposed. The boy in business learns quickly that he must obey or meet the penalty. It is inculcated in his mind by the danger to his position. This law is not, however, as firmly fixed in the mind of the student as in the boy at work. In-

stances could be given without end, but a few will suffice. Hallowe'en depredations are usually committed by school-boys, and are disregarded by the public. College boys are regarded as beyond the law in their "class scraps" and celebrations. Theft of signs, silverware from hotels and restaurants, breaking and destruction of public property by school and college boys is winked at by the authorities and by the parents. If an officer is courageous enough to endeavor to enforce the law, pressure is immediately brought by parents and influential citizens for the mitigation of the penalty, and too often with entire success. These things are more influential in teaching a boy the power of "pull" and his own supremacy above law and discipline than all the ethical teaching that may be given him in the classroom in five years. They directly inculcate lawlessness, selfishness and scorn for authority.

These are, of course, features of school life to which the girls are not so subject and which are not of such grave danger to them in any case, because of the fact that they are not to have the same after life that the boys expect to undergo, but, on the other hand, there are peculiar temptations that they must meet and overcome if they are to develop strong characters and sturdy moral natures. Among these things may be mentioned the tendency toward dependence upon some one else for their work, thus lowering their self-dependence; there is also a strong tendency on the part of some girls to a silliness of emotional nature, an unnatural hero or heroine worship, which is sometimes exceedingly difficult to combat.

In the high-school period play takes on an educational value which must be investigated and understood. The children at the age of entrance into the school begin to enter upon games which require, not only individual quickness and ability, but which to an increasing degree demand the team spirit, or unity of mind and purpose of a number of persons. The child is learning that he cannot exist alone, he cannot in a selfish way have pleasures for himself and himself alone. That he must consider others and give up his will to the demands of the majority. With the coming of this

time, too, is begun the period when the boys and girls begin to "go together." This is noticeable on the part of the girls as early as the first grade, but is not characteristic of boys before the third is reached. In addition to these features the various parties, clubs and other gatherings go to make up the social life of the pupils of the school.

In addition to these features, within the last few years a new institution has made its way into the life of the high-school students. This is the club called the "fraternity" or "sorority." A selected group of boys or of girls, having pins, often with cabalistic Greek letters, which mean absolutely nothing to the initiates—nor indeed to any one else—fraternity meetings, initiations, politics, pledges, and in fact all the other features that go with secret organizations. The initiations sometimes consist, in the cases of girls, of branding with indelible nitrate of silver, requirements to perform silly actions, disobedience of commands, violations of school rules, and whatever other foolish, silly or useless deed may occur to those in charge of the initiation. In the case of the boys the silly initiations are sometimes carried to a degree that violation of the law of the land is involved; sometimes, nay, indeed, frequently, physical danger is involved in the initiation, and almost always physical pain is one of the accompaniments. Some act involving personal humiliation is almost invariably a feature of the initiation, and in more than one case known to me moral damage to the boy's purity is the result.

These organizations are spreading, and their evil effects are seen not in their initiations, but on their influence on the school life, which is distinctly for the worse. They have divided the social life of the schools where they have been introduced, into small parties, have introduced an expensive method of entertaining, often leading to such things as wearing of evening dress for the boys, use of carriages and flowers for parties, expensive presents, elaborate dances and other parties, box parties at theaters, increased extravagance in dress, and in all these, as well as in various other ways, have brought discordant elements into the school life. They have usually in the

elective offices of the school endeavored to abrogate to themselves all the positions of honor and dignity, and most frequently with entire success, thus excluding the meritorious student who does not have the "good fortune" to belong to the ring.

This evil, the fraternity question, is the most serious one that threatens the social life of our high schools. At the meeting of the co-operating schools of the University of Chicago, held in November, 1906, a prominent high-school principal said:

"I have found in my seven years' experience that the fraternity is a most degrading influence. Boys belonging to fraternities will lie, cheat, swear, do anything to remain loyal to their fraternities. The fraternity has developed professional liars in my school.

"As an example of the evil wrought, I want to point to two cases of the sons of a prominent St. Paul lawyer. They joined one of the prominent fraternities of the school after their father had talked the matter over with a prominent judge, I believe. These boys went straightway to the bad. Before they left the high school they were badly dissipated young men.

"If those boys were sons of mine I would rather see them in their coffins than in a fraternity. When it was too late their father came to me and said: 'Why, in God's name, didn't you tell me about this fraternity evil?' Some of the boys who have gone to the bad have come to me after a few years and said: 'I made an ass of myself. Why didn't you tell me?'"

The committee appointed to investigate the question said as a part of their report:

"Fraternities and sororities are detrimental in their influence on the life of the school in which they exist, they are detrimental to the pupil himself, in that they undermine the character and become a fetish, worshipped by immature boys and girls, creating disloyalty to the parents as well as to the school; that they are mere imitations of college life leading to early sophistication and to manipulation of community politics; that they show a truculence absolutely comical in its character, were it not so serious in its effects; and, finally, that they are undemocratic and unsocial."

The following resolution was adopted by a body representing 400 of the strongest, best and most progressive high schools and academies of the West and Central States, with but two dissenting votes:

"In the judgment of the deans and principals of the schools affiliated with the University of Chicago, neither the fraternities nor the sororities have a place in secondary school life, and both are condemned."

The various clubs and dances thruout the school year make continual demands on the time and energy of these young people. These are not harmful if not carried to excess and if indulged in with the knowledge and consent of the parents. If they are carried on thru the week, however, as they oftentimes are, then there is the harm that always results from the dissipation of energy and distraction from study. It is easy for the teacher to tell in school the day after a party what pupils have attended, by the wearied air, tired attitude, inability to work thru loss of sleep, as well as by the actual falling asleep at the desk, of more than one pupil as has happened during the present year. Certainly once a week is a sufficient allowance for social pleasure of high-school pupils, and this can be arranged to come on Friday night, when it need not interfere with school work, but this is not always done. Parents are averse to refusing their children the privilege of "just a little party. We will go home early," which means eleven o'clock or later before breaking-up time and near midnight before bedtime, and consequent failure in their next day's tasks.

This danger thru the social life results in many cases from a too liberal supply of money at the absolute disposition of pupils, without question as to the disposition made of it. I know a large number of boys who work thru the summer and who make in that time from \$25 to \$100. I suppose that the majority of the boys who work during the summer make at least \$50 during that time. I have personal knowledge of more than fifty boys who were at work thru the entire summer last year. I admire them highly for their industry and energy, and I do not hold them responsible for the disposition that they make of their money. They feel that they have earned it and that they should be allowed to dispose of it as they see fit, and indeed there is a large element of justice in their claim. But their unwisdom is rapidly inculcating in them habits of extravagance and carelessness as to money that can but have a harmful result on them when they are required to earn their own living. I do not believe that it is wise to give a boy an allowance. He should

be able to provide himself with what spending money he needs, and the most of our boys do so and do it gladly. I do know one boy who is given \$20 per month, from which he is expected to provide his clothing, and I am informed that he buys very little, depending upon his mother to get for him what he needs, and spending selfishly on himself the allowance that he receives.

This extravagance again manifests itself in the elaborate clothing that is worn to school by a large number of the girls. Girls come to the high school on ordinary school days wearing silks and satins and the most expensive kinds of clothing. We hear the rustle of silken under skirts and see the glitter of jewelry and decorations that are in bad taste as well as a deterrent to those who are unable to be provided with similar articles of adornment. The unlimited supply of good clothes, lavish funds for the purchase of indigestible delicacies, unlimited money for attendance on places of pleasure, all these things certainly are unmistakable dangers that meet our boys and girls at every turn of their course thru the high school. I do not speak of the associations they form here, for they must make friends wherever they may be, and they certainly will be in a better opportunity to make the right kind of friends in the school than they will outside its walls.

Then there is a danger that besets these young people thru their ignorance of themselves and the neglect of their parents to warn them. I doubt if one parent in fifty realizes the power of this danger. I am certain that not one in a hundred realizes that what they do not tell their children they are going to find out in some other way. I would emphasize thus the evil of bad company with as great power as I know how, and urge upon the mother of every boy and girl present today that they should study this problem.

Finally, there are features of the school life which tend toward the dissipation of the energy of the pupil and cause a weakening instead of growth of intellectual power. The natural tendency toward procrastination must be encountered and fought at every opportunity. Strong ideals and high standards must meet the desire to secure the credits and graduation thru the easiest possible road.

This demands the strongest and most experienced corps of teachers that money can secure, and requires a realization of the fact that with the increased scale of living, the salaries paid to the teachers must be correspondingly increased. The teachers must be secure in their positions and must realize that their permanent interests are in the community where they are employed.

Do you ask me how these dangers and evils are to be met and overcome? The answer is easy, but the remedy is difficult and requires perseverance and continuity of effort in the face of the greatest discouragement. The only way that I can see for a remedy of these conditions is, first, thru an insistence on the part of the parent that the child must continue in school and thus overcome the first danger mentioned, namely, that he will not finish his course. This lies wholly with the parent. He must not allow discouragement, dislike of school or teacher, or desire to be at work stand in the road of a complete education. The home must stand back of the school in every feature of the life. The parent is the one to correct the dangers of the social and moral life of the pupil. The school has the child three or four hours of the day. The home and the street have the remaining twenty. To see then that it is the home and not the street with all that that typifies is the great problem, the solution of which will answer every question that has been raised here today.

MARSHALL TOWN, IA

Literature

A Messianic Novel*

WE have reached the limit at last, or at least we hope so. Duffield & Co. have issued a sort of red-backed New Testament, with the scenes laid in Vermont and New York. The author is a woman who has not only plagiarized the New Testament and the acts of the Apostles for her material, but Madam Blavatzky as well as other theosophists, yogi, mystics, mental scientists, Christian scientists and spiritualists. It is the most naïvely composite compendium of quotations ever dramatized as fiction and designed as Scripture. In saying this our purpose is not to prejudice our readers against the thing, but merely to inform them of what it contains. There are persons who prefer mixtures to plain, simple nourishment. It should be very popular as an "interpretation" in female metaphysical clubs, where the members cultivate a "sense of the infinite" with both hands. As a matter of fact it is an interpretation. The son of Mary Bethel is Jesse Bethel, and the reader begins the story with the impression that he is a little boy afflicted with worms and bad dreams, but presently, seeing how in earnest the author is, and how seriously she takes him, we are a trifle ashamed and struggle for reverence, but do not catch on to who "Jesse" really is till he runs away from his father and mother in a large city and is found teaching a group of doctors in a hospital. Whenever he opens his mouth to speak he plagiarizes the manner of the young son of Mary and Joseph of Nazareth, and the wisdom of the Veda, or of the mental scientists, or the Christian scientists, or he splits the words of Jesus himself so they mean the same thing. He is beautiful, like a man and like a woman. The author has accomplished a miracle in fiction that could not be accomplished in real life when she imbeds such a youth in the village of Nashburg, Vermont, with the usual village types, without making him stand

out like a human exclamation point. He eases his way thru youth and young manhood so simply and unaffectedly that none of the characters in the book see what the reader sees, that he is "without sin."

Almost every incident in the life of Christ is interpreted in the Vermont atmosphere by some incident characteristic of modern conditions. And it is owing to how the reader has been reared as to how he will feel about these liberties with the holy Scriptures. It may be all right, but some will find it decidedly shocking when young Jesse rides a wild colt and tames a mad dog in imitation of the swine incident in the life of Christ.

But Jesse goes a trifle further than the Son of God. He undertakes to explain what God is, what spirit is, and what he himself is. God is every man's selfless Self. There is one Spirit and every man is the body of it. So that this one Spirit has as many bodies as there are beings in existence or ever have been in existence. God is Power, and Jesse is the expression of that power. The ethical teaching of Jesse is elevated and proper if he did not have a female author who is constantly using him to speak for the dissolution of metaphysics which some modern near-thinkers believe *is* metaphysics.

All the characters who figure in the New Testament figure in the story. John the Hermit makes a very good travesty on John the Baptist. Jesse himself is the son of a carpenter and follows his father's trade till he reaches his thirty-odd years. He picks up his disciples here and there and the reader has no difficulty in recognizing the characters of Peter and John and Andrew and the others. But by way of gathering the woman's movement and bringing the ministry of the new messiah right up to date, the author adds a couple of female disciples to the scripturally certified list. One of these is Mary Magnus, a rich young woman, who corresponds both to Mary Magdalen and to the Mary at the well who had had seven husbands. She is never married, having loved Jesse and

*The Son of Mary Bethel. By Mrs. B. Duffield. New York: Duffield & Co. 300 pp.

being gently called down by him, afterward keeps her freedom but "gives herself to a man," as she tells Jesse in a letter. This is the one glaringly false note in the book, from the moral point of view. The author insists that this Mary kept her pure heart, and makes Jesse say as much.

And it appears that the gospels in this Vermont New Testament are also a concession to the woman movement. Jesse's Mary-disciple is the only one who keeps a diary, and so we have Jesse's gospel according to Mary.

All told, the book is harmless. If the reader is perfectly sane and normal he will not understand the worst parts of it, which are merely bad on the mind, and if his faculties have already been dissolved by the New Thoughters, his case is hopeless anyhow and he might as well buy it and enjoy it.

The Eternal Values

IN *The Eternal Values** Professor Münsterberg has given serious and scholarly formulation to the philosophical strivings of a lifetime. The work is a new and closely wrought expression of ethical idealism, seeking, thru an analysis of the meaning of value, to show that values constitute a system, objective, necessary, absolute. The author finds that the majority of thoughtful persons today regard all values as relative, as ultimately mere instruments for the service of various and conflicting individual gratifications. Thus, beauty is fundamentally but agreeable sensations; truth merely that which helps us fulfill our purposes; morality nothing but useful prescriptions for social comfort. Yet our deepest instincts protest against such relativism. In our most earnest strivings we, too, feel with the artist, statesman, investigator, that in promoting truth, beauty and human progress we are serving some absolutely valid, over-personal cause. It is this view which Münsterberg constructively supports, offering, instead of the destructive criticism which has already done its work, a new and positive system of absolute values.

These values, which cannot be denied without self-contradiction, are not to be found in some aloof, transcendent realm, but only in experience itself. Since values are will-satisfactions, natural science cannot reveal them, for the scientist, whether dealing with mind or nature, abstractly conceives his world as a mechanically connected system of objects, independent of will. As little can we find pure values in the purposes of individuals, for personal desires as such are strictly relative, and no sum of relatives can yield the necessary or absolute. Nor can they be found in any universal desire for pleasure, since pleasure is not in itself the goal of will, but rather the accompaniment of successful activity directed toward objects. In the quest for absolute values the observational method fails, and those judging from that viewpoint will find the present work confusing and disappointing. Yet there is the subsequent and necessary work of critical reflection, which, dealing with experience as a whole, seeks for those principles necessarily involved in the very constitution of experience. By such a transcendental analysis Kant showed that only as the mind itself, thru its own spontaneous activity, guided by its own laws, infuses unity, system and necessary connection into the original chaos, do we get any independent and rational world. This world-building work of synthesis and organization, the source of the world's structure and significance, Münsterberg assigns to a fundamental act of will, for the will is in essence the achievement of identities between anticipated and realized experiences. The satisfaction of such a will act holding for all who have any world at all is the fundamental pure value. From this the author develops an imposing system of values. Finally, thru religion as feeling and philosophy as thought, all oppositions between these values are resolved and their source disclosed in the one, all-embracing, over-individual assertion of the Absolute Will. This world totality, for religion God, for philosophy the Absolute, is not any ready-made substance. It is not a thing, but a deed, postulated in our deepest convictions as the meaning and the goal of life, "the over-experienceable in

*THE ETERNAL VALUES. By Hugo Münsterberg. Boston: The Houghton, Mifflin Company. \$2.50.

which all experience comes to completion."

It is the all too common caricature of idealism as mere immaterialism or illusionism that has so long withheld it from fullest acceptance. But in no sense is the world as conceived in the present work mere idea or mere personal creation. It is, on the contrary, a world objective in the sense of being independent, universal, necessary and infinite. Yet it is not an unintelligible world, out of essential relation to mind. Rather it is the embodiment and expression of the Absolute Will; its antagonisms, multiplicity and apparently final opposition to consciousness exist only in so far as spiritually significant. On this view the moral and esthetic values can be given their rightful place of co-equal reality with existence itself.

The essay form of "Psychology and Life" inevitably involved philosophical defects. Because of the questions that it left and the promises it held forth, the present more serious work is especially welcome. In the earlier work the underlying philosophy of will was of necessity announced rather dogmatically. Here it receives a thoro, critical grounding. Formerly, in his anxiety to show the special and provisional character of science, the author seemed at times to be indicting rationality itself, setting against the scientific constructions an apparently vague and characterless immediacy. Yet reason in its broadest meaning is exalted in *The Eternal Values*, and the immediacy here championed is not blind feeling, valuable because uncontaminated by thought, but a concrete experience which is implicitly rational.

The work will be variously received. The realist will find it subjective, while other critics will find in the references to "the given" and "the material of thought" the still unexorcised wraith of the Kantian "thing-in-itself." The intellectualist will complain that the voluntarism terminates in mysticism. Others will insist that, altho the systematic form for philosophy is abundantly justified, yet system is perhaps here worked overtime; for the over-facile symmetry of some of the more detailed results is not always just to facts.

Those sympathetic with the idealistic

standpoint will find the work in the main convincing and inspiring. It will be welcomed by the increasing number of those who, weary of a mere triumphant accumulation of fact, are asking for the meaning of it all; who, distrustful of an over-facile pragmatism, look for an interpretation of life thru abiding principles. It is a specific merit that reality as herein set forth has that concreteness and immediacy for which pragmatism has rightly called, yet it has also that rationality and system in default of which pragmatism is fatally defective. The demand for an Absolute in the making is herein met. The system is teleological in the best sense. The work is marvelously suggestive and catholic enough to find honorable places for even such philosophical outcasts as industry and miracles. With bold consistency it extends its range to all aspects of life, thereby well reminding philosophers, in a day of over-cautious specialization, that their real task is the interpretation of life as a whole.

Altho the work was produced from the start in six weeks, an amazing achievement, it is on the whole clearly written. It is undeniably hard reading. Save for a few eloquent paragraphs it lacks charm; there are blind passages and even whole sections whose meaning is curiously elusive. But the work was not designed for entertainment. With a wholesome and uncompromising intellectual severity it seeks for only that success which is justified by the depth and cogency of its thought. Yet to the industrious and sympathetic reader the work is quite accessible. Of all the services which Professor Münsterberg has rendered the thinking public in this country, this volume is the most worthy and enduring.

ARTHUR UPHAM POPE.

An Earth Poem—and Other Poems. By Gerda Dalliba. With an Introduction by Edward Markham. New York: G. P. Putnam's Sons. \$1.00.

If vagueness of thought, obscurity of language, veiled meanings which are but the echoes of meanings, constitute a poet, then Gerda Dalliba is a poet. The Browning Clubs have now something to do—a nut to crack. With the poet alive

to help them, they may come upon a kernel worth their trouble. They will have to grapple with a new set of rules for punctuating nonsense into sense; to find a new lexicon to explain the uses of words added to the English tongue with more facility than felicity, and a new critical apparatus to disentangle disturbed imagery. Then, perhaps, some advanced Browning Club may find a clew to the "intent of this necessarily abstract and lyric poem," which, the author says, is "to express in words man's needs, capabilities, and progress," to indicate poetically "the slow progression of the mass by the care of civilization and cultivation to a penetrating view of essential needs." It may safely be said that this is a big job. In order to accomplish it more is called for than youth, a "wild" imagination, and some casual felicities of imagery. The author evidently has youth; she certainly has the courage of invention; what is also important, she has a good ear for rhythm. One may with joy accept as a good example of her casual felicities the lines quoted by Mr. Edward Markham:

"The oriole swings above a grave
And chirps as willingly above a cross,
As if young lovers plighted."

Take this also as witnessing to her fine emancipation from a troublesome lexicon. It is taken at random from a poem called "Sympathy":

"Blue green leaves soft in their manganist
touch
Deterring the harshness of gnarlings o'er
much—

Magnanimous reachers of feels pitying
As marveling winds with their mouth full of
sing—

Sympathy—sympathy."

Between these two expressions—a clearly conceived figure freshly stating a homely old thought, and her wild search after novelty—an attempt to express the inexpressible, to define the chaotic by the use of a jumble of words, a chaos of imagery, the Browning Club or the Whitman coterie may find the definition of a genius.

The Great English Letter-Writers. With Introductory Essays and Notes by William J. Dawson and Coningsby W. Dawson. New York: Harper & Bros., 2 vols., 12mo. Each \$1.

There is useful method in the arrange-

ment of *The Great English Letter-Writers*, selected and provided with introductory essays and notes by William J. and Coningsby W. Dawson. The classification is by subject, in order "to show how various men and women, scattered thru different ages, have borne themselves under the same crisis of emotion and action." Thus, Goldsmith, Crabbe, Coleridge, Charles Lamb, Charlotte Brontë and Mrs. Carlyle are brought together to complain of the tribulations of genius, the said tribulations varying from Crabbe's starvation and Goldsmith's debts to Mrs. Carlyle's despair over crowing roosters and barking dogs in the house next door in Cheyne Walk. Love is discussed by, among others, Richard Steele, Lady Mary Montagu, Pope, Sterne, Byron, Keats, Shelley and George Eliot, in her letter to Mrs. Bray, explaining, rather than "defending," as the editors put it, her union with Lewes. Under the heading "Crises," we find Lamb's letter to Coleridge announcing the terrible tragedy of his sister's life and his own, and Coleridge's answer. Three related sections, appropriately printed together, deal with "Criticising the Critics," which Keats and Shelley contribute almost entirely; "The Artist and His Art," ranging from Edmund Spenser to Robert Louis Stevenson; and "Literary Verdicts," which includes one of De Quincey's ever-helpful letters to a young man, Charlotte Brontë's verdicts on Thackeray and Jane Austen, and Thackeray's on "David Copperfield." The letters are well selected and presented to greatest advantage.

The Pauline Epistles. A Critical Study. By Robert Scott. New York: Imported by Charles Scribner's Sons. \$2.

There is no doubt that the time has come for a thoro restudy of the New Testament, making full and free use of the critical-historical method, which in the case of the Old Testament has already given us a new and more vital book. There are indeed many who "still live in a paradise of satisfaction with tradition, and are unconscious that real problems exist" in connection with New Testament study, but the wise and able student of Christianity cannot but feel

the inadequacy of present theories to account for the rise and relationship of the books which constitute this section of Scripture. To such a student this work by Dr. Scott will be readily welcome, even if he is not fully convinced that all the conclusions are valid. The author has attacked the problems connected with the Pauline Literature in the spirit of freedom and with the method of the scholar. He has tried to indicate the teaching of the Epistles and at the same time to set forth a theory of authorship based on characteristics of thought and style. The fulness with which the latter is stated and buttressed by the facts of language and teaching has necessitated the most careful and painstaking study of vocabulary, modes of expression, similarities and dissimilarities of thought and linguistic usage, not only of the various Epistles, but also of their smallest divisions. Dr. Scott's conclusions are always interesting, and many times startling, altho his proofs are in many cases not convincing. He holds that Paul's own writings are confined to the Corinthian, Philippian and Galatian letters, and Romans I-II, and even these show linguistic traces of being touched up by Luke. Silas appears as the author of Ephesians, Hebrews, and parts of several other letters, and is declared to be the final editor of the Gospel of Matthew: while Timothy is regarded as the writer of the Colossians, parts of the Thessalonian letters, and the final redactor of the Gospel of Mark. Perhaps the most curious conclusion is that of the Lucan authorship of the Pastorals. On the whole Dr. Scott brings his linguistic studies to bear on the problem with great skill and doubtless attributes too much weight to them in drawing his inferences. The argument against the Pauline authorship of I Thessalonians has never been presented so cogently, but his claim in regard to the authorship of Matthew has a very small basis. The new difficulties appear greater than the old when one finds Hebrews and the apocalyptic sections of Thessalonians attributed to the same hand. Many facts are associated and pressed into service when other interpretations of them are not only probable but almost certain. It surely

seems to be a far-fetched similarity that is found between passages in Peter and Ephesians, where in one case Christ preaches to the spirits in prison and in the other thru Apostles to men. One may well ask on what grounds other than the necessities of his theories the author declares that the preachers of Christianity did not encounter the syncretistic philosophies of Asia Minor until the last quarter of the first century. And how can we attribute to Paul the authorship of Corinthians and Romans, and still hold that there is no trace in him of a Logos doctrine? Such bold treatment and striking conjectures as are everywhere characteristic of the book will naturally arouse vigorous opposition, but out of the fires of criticism there will no doubt come forth some pure gold. The work continues the series on "The Literature of the New Testament" so ably begun by Prof. E. F. Scott's Fourth Gospel.

Principles of Business Law. By John Aldrich Chamberlain. Cincinnati: The W. H. Anderson Co. Pp. xvi-436. \$2.50.

The purpose of this book is to furnish business and credit men with the principles of law underlying ordinary business transactions. It is, therefore, not adapted to the use of law students, being too crude and too elementary. Students of business colleges would likewise find it of no great value as a textbook, because of the field and the wide range of topics covered. The prime usefulness of the volume is as a book of reference. Its value in this respect, however, is somewhat impaired because of the meager information given on very important topics. The whole subject of corporations, for example, is covered in a single chapter of thirty pages, and a business man, wishing to know his rights as a stockholder or his responsibilities as a director, would find very little in the way of information that will help him by consulting the work. "A little knowledge is a dangerous thing," in legal as well as in other matters, and "business and credit men," for whom the author prepared his volume, cannot afford to act on information gathered from short topical paragraphs in an elementary reference book.

Remaking the Mississippi. By John Lathrop Mathews. Illustrated. Boston: Houghton-Mifflin Co. \$1.75.

Mr. Mathews relates in simple language and attractive style the achievements of many years' efforts in shaping the channels and controlling the waters of the great river. More than sixty millions has been spent on this work since the Civil War, and there are now some 1,400 miles of artificial banks along the lower reaches. Much of the work has been ineffective, since the science of flood-control had to be painfully learned by experience, but the later work has been such as to warrant the claim that the river is now held firmly within bounds. The chapters on the hydrology of the system—the varied rainfall, the frequency and incidence of floods and the like—are accurately and attractively told. It is an instructive book.

Tolstoy the Man and His Message. By Edward A. Steiner. New York: Fleming H. Revell Company. Pp. xxii, 353. \$1.50.

Dr. Steiner's little study of Tolstoy is a first-hand document. It gives the impressions of a man who has had the opportunity of seeing and knowing the great Russian author and reformer, and who has used his opportunity with a genuine desire to penetrate as nearly as possible to the heart of his subject. With all his admiration and love of Tolstoy, Dr. Steiner does not class himself among the real Tolstoyans—the class of man who, coming to Tolstoy for advice and help, enrolled themselves under his banner and in all earnestness endeavored to live up to his teachings. He belongs rather to the second class—"the many who came, saw and heard, and returned to their homes with a new influence in their lives, but unable to sever themselves from the wealth and culture they possessed or the society in which they moved." Among these far-off disciples, however, Dr. Steiner is doing good work for his master in endeavoring to make Tolstoy understood by the English-speaking world, and in trying to clear away the misconceptions and the false ideas which are partly due to the vast racial differences which exist between the Slav and the Anglo-Saxon.

Short as is the monograph, Dr. Steiner has succeeded in giving his readers a fairly adequate sketch of Tolstoy's life and family, a vivid picture of his home and surroundings, and a brief *résumé* of his principal writings, along with a running commentary elucidating his teachings.

The French Revolution: A Short History. By R. M. Johnston, M. A. New York: Henry Holt & Co. Pp. vii, 283. \$1.25.

So tremendous and so widespread have been the effects of the first French Revolution that it seems hardly possible that any adequate account of the events of the ten years which followed the summoning of the States General in 1789, could be given within the compass of 300 brief pages. Yet, just because it is concise and free from detail, Professor Johnston's little monograph is of special value. The student who has had his imagination fired by Carlyle's prose epic, and who has waded thru the pages of Michelet, Lamartine and Thiers, is enabled to correct his perspective and to grasp again the events of the tumultuous decade of 1789 to 1799 as a connected whole; and for the reader who has not yet plunged into the detailed histories of that momentous epoch, Professor Johnston's volume offers a convenient framework into which the whole story may afterward be fitted. Nor must it be imagined that Professor Johnston gives merely colorless annals of the events which so rapidly succeeded each other, while France was shedding so much blood in the making of history. Professor Johnston's chief object in writing his book has been to catch the perspective, a task which has only become possible of recent years now that sufficient time has elapsed to allow France to recover from the blows of revolution and reaction, and at last to attain to something like a democratic equilibrium. As it stands, Professor Johnston's volume forms a fitting prelude to his "Napoleon," which was published in 1904, and the two together embody the history of France in the momentous years which intervened between the reigns of Louis XV and Louis XVIII.

Literary Notes

....The full report of the Fifteenth Annual Lake Mohonk Conference on International Arbitration, held last May, can be obtained free on application to Mr. H. C. Phillips, Mohonk Lake, Ulster County, New York.

....Gustavus H. Myers, author of the "History of Tammany Hall," has been engaged for years in a study of the origins of great American fortunes from the documentary sources, and the results of his investigation will be published by C. H. Kerr & Co., Chicago, this fall.

...."Atalanta in Calydon" and "Erectheus" because they are "among the most characteristic products of his dramatic genius," and "Mary Stuart" because it was the poet's own favorite among his dramas, make up a consistent selection of *Swinburne's Dramas*, which Prof. Arthur Beatty, of the University of Wisconsin, has provided with a good introduction, a short bibliography and the necessary notes (Crowell, \$1.50 net). It is a well-edited and a well-printed volume, serviceable alike for the student and the "general reader."

....The *Religionsgeschichtliche Volksbücher*, edited by Michael Schiele and published by Mohr, of Tübingen, the special purpose of this series of brochures and booklets being to popularize the results of progressive theological research, and the totals of whose editions within the last four years have reached the enormous figures of four hundred thousand copies and more, has recently been increased by two numbers, Pastor E. Peterson, writer on *Die wunderbare Geburt des Heilands*, while, even more important, Prof. Johannes Weiss has a heft on *Die Anfänge des Dogmas*. Both brochures bring positive results, but not in the traditional sense of this term.

....For the first time in the history of the German universities the total enrollment of full or matriculated students has passed the fifty thousand line, the total during the present semester being 51,700, as compared with 48,730 last semester and 47,799 one year ago. This immense total is distributed as follows: Berlin, 7,194; Munich, 6,547; Leipzig, 4,581; Bonn, 3,801; Freiburg, 2,760; Breslau, 2,347; Halle, 2,310; Göttingen, 2,280; Heidelberg, 2,171; Marburg, 2,134; Strassburg, 1,935; Tübingen, 1,921; Münster, 1,760; Jena, 1,606; Kiel, 1,593; Würzburg, 1,369; Königsberg, 1,293; Giessen, 1,271; Erlangen, 1,188; Greifswald, 667; Rostock, 743. The *Universitätskalender*, from which these data are taken, adds that with the non-matriculated students, the sum total of academic citizens is over sixty thousand.

....The vice-chancellor of Oxford, and president of Magdalen College, Mr. T. Herbert Warren, D. C. L., has collected a number of his related contributions to the *Quarterly Review*, the *Monthly Review*, and the *Edinburgh Review*, and published them in book form under the title of *Essays of Poets and Poetry*, Ancient and Modern (Dutton, \$3).

Most of them are therefore book reviews in the old liberal English sense, the book or edition nominally under discussion serving in reality as little more than a peg on which to hang a general essay on the author and his work in all its bearings. This peg, this point of departure is in the present instance mostly a comparative one, leading to parallels drawn between Sophokles and Goethe, Virgil and Tennyson, Gray and Dante, Tennyson and Dante. In addition there are studies of Matthew Arnold, Dante and the Art of Poetry, the Art of Translation and of "In Memoriam" after fifty years and, a comparative again, an address on "Ancient and Modern Classics as Instruments of Education," which in the increasing current of modern educational departures seems to have gained a convincing significance with the passing of the years since its delivery in 1905. Suggestive studies, these, of a ripe scholarship, which hardly appear to need the final revision which their author deplores that lack of time has made impossible.

Pebbles

If prohibition does not prohibit, what in the world are the brewers and liquor dealers howling about?—*American Issue*.

Poor Magda, so the critics say,
No more as queen we'll hail.
'Tis said she strained her voice one day
While singing thru a veil.
—*Cornell Widener*.

A HAT.

"Come into the garden, Maud,"
Said facetious-minded Fred.
"What's the use," said Maudie,
"I have it on my head."—*Life*.

The cobbler was an honest man,
He always did his duty;
The plunks he got from mending shoes
He wisely called his booty.
—*Columbia Jester*.

An astronomer living at Greenwich,
Endowed with luxuriant Speenwich,
In the interest of science,
Set pride at defiance,
And shaved, tho it did make his Cheenwich
—*Princeton Tiger*.

We say this is as wise as anything ever said
by Carlyle, or Emerson, or Tolstoy, or Marcus Aurelius, and it was written by a modest country editor in Kansas: "Whenever the dogs get too thick in a town, a mad dog story is started on them"—*Atchison Globe*.

An auto took poor Billy's head right off last Saturday.
Though Bill is hard to ruffle, he was quite cut up they say.
And tho his words are as a rule most splendidly selected,
The speech he made at that sad time was rather disconnected.—*Harvard Lampoon*.

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - New York

A WEEKLY MAGAZINE. FOUNDED IN 1848.

One Year, \$2.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, \$1.75 a year extra; to Canada, \$1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with \$1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

Congressman Parsons's Charges

It begins to be seen thruout the country that the charges deliberately published by Congressman Herbert Parsons, of New York, relating to the defeat of certain bills in the Legislature at Albany and the contest over the Speakership and the rules of the House at Washington, point to a political offense of a very serious character and must be the subject of official investigation. Mr. Parsons has been a member of the House for several terms, and for some years has held the office of president of the Republican Committee of New York County. In that office he has sought to prevent fraudulent registration and voting. He is one of the leaders of his party and as such was trusted and consulted by President Roosevelt. In his original statement he said:

"In the last session of the Legislature we sought legislation to perfect the signature and other registration laws. It was defeated thru a combination of Tammany men with some up-State Republicans. We discovered that it was part of the deal entered into to get support from Tammany for Speaker Cannon and his rules in the House of Representatives. No information of the deal was given to New York City Republicans either in Albany or in Washington."

He has since declared that this is "absolutely true." He promises to publish hereafter the names of those involved and the details of the transaction.

The charge is, in substance, that a bargain was made between Republicans exercising powerful influence in the Albany Legislature and in the House at Washington, on the one hand, and the Tammany Democrats, in both places, on the other; that, in payment for Tammany support to be given to Speaker Cannon and the old rules of the House, Republicans at Albany undertook to prevent the enactment there of bills designed to prevent fraudulent registration and voting; and that the foul work was done. That is to say, it is alleged that influential Republican legislators bought support for the Cannon organization and the old rules of the House by facilitating fraud in registration and at the polls in New York City, the assumption being that such fraud would be used against the candidates of their own party.

Mr. Parsons has become familiar with the methods and devices of those engaged in promoting fraudulent registration. To prevent such registration he and his associates have suggested legislation. Last winter there were pending at Albany several bills designed to perfect the new law concerning the signatures of registering voters. They encountered opposition which could not easily be explained. In the closing hours of the session, at the end of April last, they were defeated. In the Senate, twelve Republicans voted against them, with the Democratic minority.

Less than three weeks later the attempt to revise the House rules was made in Washington. It was known that about thirty Republicans were ready to vote with the Democrats for a revision that would deprive the Speaker of the great power which the old rules had given him. These insurgents, with all the Democrats, would be a majority. There was much gossip at the time about bargains said to have been made with Democrats for their support of the old rules and the dominant organization. But legislation at Albany was not mentioned in the current reports. Tariff duties were said to be the basis of the agreements. It is remembered, however,

that a former member of the House from New York was regarded as an active agent in the political negotiations.

In the contest at Washington several votes were taken, and at first the House declined, by a small majority, to adopt the old rules. Then the revision project of a majority of the Democrats was rejected. Immediately afterward, however, Mr. Fitzgerald, of Brooklyn (a Democrat), moved the adoption of the old rules with certain amendments which amounted to little or nothing. This motion was carried, 211 to 172. The Republican insurgents stood with a large majority of Democrats in the negative, but Mr. Fitzgerald took with him twenty-two Democrats, six of whom were Tammany men from New York. There were five from Georgia and two from Louisiana, and it was believed that the action of the Southern men was due to their views about the tariff. When the committees were made up, the Democrats who had followed Mr. Fitzgerald were not forgotten. One of the Louisiana men and one from New York were placed on the Ways and Means Committee. Mr. Fitzgerald himself was promptly appointed to the powerful Committee on Rules. When the tariff bill was reported, it contained provisions highly satisfactory to the gentleman who had been regarded as the negotiating agent. Cynical persons in Washington remarked, however, that they could not find an explanation of the action of a majority of the Tammany Congressmen who voted with Mr. Fitzgerald.

Congressman Parsons now offers an explanation, asserting that the Tammany men (Mr. Sulzer was not in the group) were paying for the defeat at Albany of the bills designed to prevent fraudulent registration in New York City. We should add that denials have been made by Mr. Cannon, by two or three of the Congressmen affected, and by the recognized leaders of the two parties in the Albany Senate. One of these leaders is Senator Raines and the other is Senator Grady.

Mr. Parsons has virtually promised, as we have said, to give names and details. He should publish them without delay. We assume that he has information which he believes to be trustworthy and

convincing. After what he has already said, the public is entitled to it. He should lay it before the people at once.

Obviously, there must be an investigation in the approaching session of Congress. Mr. Fitzgerald will doubtless demand one; the Tammany men who stood with him and against a large majority of their party may insist upon an inquiry; their associates from Georgia and elsewhere will be moved by public opinion in their States, as well as by their own desire for vindication, to ask for a thorough examination of the charges. Probably the Speaker will seek an opportunity to testify before a select committee, the members of which really ought not to be appointed by himself.

President Lowell's Inaugural

ONE studies President Lowell's inaugural address not so much to read the lines as to read what is under the lines. One is not to expect much that is novel in the general statements formulated—and they are not novel—as in the drift and emphasis of them, and the incidental flashes of light on the policy which, under his direction, is to affect the generation of youth which he will lead.

President Lowell could do little else than to enunciate what is rather commonplace at this time, for a succession of college presidents have been hammering at the same topic. He discussed the problems of the college, not the university; the proper education of young men in the period between the high school and the professional school, regarding this as the most debatable field of doubt. He has his criticism of the secondary schools, laments their inferiority to those of Great Britain and Germany, but has not a word of criticism of the post-graduate instruction of our universities. The students in the law school, he tells us, are earnest and find their principal subjects of discussion in their studies; not so with the college boys.

The chief thesis of the address is the well-worn doctrine that the student must seek to become instructed in the main principles of all the chief branches of knowledge, and at the same time become the master of one. We do not see that he puts these two purposes into separate

years of study. The great question of difference is as to whether both these purposes can be properly sought and achieved in the college course, or whether the college is for the general education, and the postgraduate university for the special education. That involves the question as to how far the general education should extend, thru how many years of study. It is urged by some university presidents that the college course should cover but two years, and that with the third year the special professional study should begin within the college and that its one or two years should count in the university, or vocational, course. Others—and here Harvard has been the leader—would have the elective studies looking to the preferences and anticipations of the boy begin even with the freshman year, and the common division of college classes into classical and scientific courses seems to accept this principle.

But this makes a hybrid thing of the college. It makes it neither educational nor vocational, but both. President Lowell tends to the broader scope of college education, but does not make it clear how far he would carry it, whether thru the two first years of college life, or thru the entire four years. At any rate, he evidently thinks that Harvard has allowed too much freedom of electives, and would put more emphasis on the foundations of general culture. He would have the classicist at least grounded in science, and the scientist made familiar with the principles of the humanities.

But the question returns, Do the two years, freshman and sophomore, afford enough time for a general culture? It was not thought so in the elder days of the college, nor is it so generally thought now. The objection raised to the four years is, that it puts off too long the period of entrance into professional life. But, on the other hand, if four years have not hitherto been too long a time to acquire a general basis of universal knowledge, certainly they are not too much now when new sciences and new sociological departments have almost overshadowed the old. There is vastly more to be learned than fifty years ago in order to be a really well equipped

man. The period allowed for such generous acquirement cannot well be shortened. President Lowell notes the fact that the German boy is more advanced than the American; but he does not call attention to the chief reason, our present foolish notion that children must not begin their studies until they reach an age when they ought to be well along with them. And this unwillingness to force the children itself comes in good part from the painful difficulty of learning to read such an atrociously spelled language as ours. Decently bright children might be able to finish their secondary course at the age of fifteen, or even fourteen, but for this unwillingness to press them forward, or to make English as easy to learn as is German or Italian.

We make no present objection to the double course in our colleges, classical and scientific, with separate branches of study leading to the same degree; but we fail to understand how in less than four years a broad and generous culture can be attained. We would allow a certain degree of liberty of choice of studies in the two upper years, but under a group system which would not permit the choice of indolence to fritter away the years of college life.

Only one somewhat novel suggestion does President Lowell definitely make, that freshmen be in a degree segregated, brought nearer together in intimacy of residence under closer supervision, so that they might become better acquainted with each other and with their instructors. Others have suggested that the two lower classes should be put under more strict government; but we doubt whether this will prove feasible in the end, except as the college course be reduced to two years—which will kill it, and send the boys back for these two years to the high school—with the two upper years given to the professional school. The evil of this we have already indicated, that it will give a dwarfed general culture. What will the sophomore sent to the professional school know of philosophy and history and the social studies that depend on human welfare and ethics?

So we come back to Milton's Tractate on Education. Time is not wasted that is given to the foundations. Let them

be broad; then let the university teach some one thing thoroly, but let the college have its wider purpose, and send forth students that have learnt how to think widely and gain an interest in anything that concerns humanity.

But a more serious question is involved in the importance of leading our college youth to take a consuming interest in their studies. Perhaps we have made a great mistake in discarding the influence of competition and assigning special honors to superior college attainment. Competitive ambition is no worse in scholarship than it is in athletics.

Modern Witchcraft

It is unfortunate that the board of directors of the Mother Church of Christian Science did not make public the evidence on which they found Mrs. Augusta E. Stetson and sixteen of her followers in New York guilty of practices not in accord with the principles of Christian Science. If this action is merely the removal of an ambitious rival or a plain condemnation for heresy, the public has little interest in it, but it becomes of some importance if, as is reported, the New York scientists were accused of "malicious animal magnetism." This is very probable, because it has always been Mrs. Eddy's custom to bring this accusation against those who departed from her teachings. Heresy and witchcraft are confused in her mind, as they were in the minds of the inquisitors. According to the testimony as it is published in the newspapers, groups of Christian Scientists were given to meeting for the purpose of exerting mental influences against certain enemies of the faith or disturbers in the Church, condemning them to the grave or willing "that the hand which writes against Christian Science should be palsied." These malign influences are said to have been kept up for days by relays of practitioners, and several witnesses testified to being afflicted by this means and driven nearly to insanity. One woman is reported to have fought against "mental assassination" with such vigor that she developed psychic faculties of suffi-

cient power to enable her body to pass thru the walls of her room.

Of course, the charges, taken literally, are false. Some of those who have been admonished by the board of directors we know personally, and they are upright and benevolent people, quite incapable of using malicious animal magnetism. Those whom we do not know personally are also incapable of it, for there is no such thing. Nevertheless, we agree with Mrs. Eddy that this is the most heinous perversion of Christian Science and the most to be dreaded, and we sympathize with her efforts to free her Church of persons of this disposition, if such there be in it. It is a logical inference that if absent treatment may make a person well, it may make him ill, and that so few Christian Scientists have drawn this inference and taken advantage of it is the best evidence we have seen of the beneficial influence of the new religion on the character of its followers. They have exerted their powers, whatever these may be, for the promotion of health and happiness, and rarely, if ever, for the opposite purpose.

But a religion cannot be expected to maintain its early purity and high ideals. As Christian Science becomes more popular and fashionable, it will attract the unworthy, and there will be, if there are not already, those who accept the belief of being able to exert a mental influence over others at a distance, but who have not acquired that universal good will which makes such a belief beneficent or harmless. Against this evil, therefore, the Christian Science authorities must be continuously on guard, and fight it by admonition, excommunication and any other means in their power.

Against it State and Church fought for hundreds of years by all the means in their power. It must not be assumed that the warfare against witches was altogether irrational and unjustified. There was never really any such thing as witchcraft, but there have always been witches. Some of them were harmless; some of them were harmful. A malignant old woman who was believed and believed herself to have the power to inflict injury on her neighbors by her curses and conjurations was undeniably

a nuisance to the community. There were two ways the community might have adopted to get rid of the nuisance; one was to punish the witches, the other was not to believe in them. The latter course was impracticable in most communities until recent times, so the former was generally adopted. The injunction, "Thou shalt not suffer a witch to live," was enforced to the letter. The punishment was not unduly severe if measured by the standard of the times. Even as late as Blackstone there were in England 160 offenses punishable by death, among them cutting down a tree and impersonating a pensioner. An evil witch, supposed to have supernatural power over the lives and fortunes of other people, might easily be the cause of more trouble to the community than a tree-cutter or an impersonator. The faults of the witchcraft persecutions were not so much the severity of the punishment as the use of torture in the trials and the disregard of the rules of evidence, resulting in the condemnation of thousands of persons innocent of any intention of practising the black art.

There was another fault, even more serious, which led to the abandonment of the policy of repression—that is, it did not work. The more witches were punished the more numerous, the more malignant they became, and the stronger grew the people's faith in them. Now that we have ceased to persecute them they are still numerous and widely credited, but are almost altogether of the harmless or benignant variety. The last prosecution under the witchcraft law in England took place in 1904, when Sir Alfred Harmsworth, editor of the *Daily Mail*, instituted proceedings against Professor and Madame Keiro, palmists and crystal gazers. The jury found them guilty of both fortune telling and of obtaining money under false pretenses, but the judge only took into consideration the latter count and suspended sentence on that.

Instead of burning witches we advertise them. The Sunday papers contain columns of the business cards of those who profess the power of reading thoughts and foretelling futures, clairvoyants, psychics, palmists, astrologers and

mediums. No ancient form of superstition but has its modern representative, and many new kinds have been invented. There must be several thousand persons in the United States getting a living at some form of magic, not counting the gypsies at church fairs and other amateur adepts. The people of Boston are said to spend over \$100,000 a year in having their fortunes told and their characters read. Probably San Francisco is still more generous.

But while white magic still flourishes, black magic is almost extinct. Our modern witches and magicians are probably rarely called upon to injure people. They still prepare love philters, but they have dropped the poisoning branch of their profession. They no longer bring tempests, war and pestilence upon the earth. If by their assistance a client once injures another person, it is only indirectly and unintentionally, as by getting ahead of him on a bargain, cutting him out in a love affair, or winning from him a wager. Finding lost articles and mending broken hearts are their main occupations. Their purpose is to promote health instead of inflicting disease. Even necromancy, once dreaded, hated and anathematized, has become merely a parlor amusement. The spirits who have possession of Mrs. Piper are an inoffensive and mild-mannered group of gentlemen, who do nothing worse than tell lies. Eusapia Palladino does no harm with her extra legs and arms except to smash furniture.

Is this reformation of supernaturalism due to an improvement in the temper of the age? Is it the result of the partial skepticism or of the complete toleration now prevailing? Are the spirits on their good behavior lest they be annihilated by being disbelieved? They admit that they are powerless even to appear except when there is faith in them. It is consoling to think that if they get to behaving badly we are able to dismiss them into the darkness whence they come by the simple method of not seeing them.

If Mrs. Stetson is a witch, if she has been exercising a malignant mental influence over her enemies, the Christian Scientists are quite right in taking action against her in the ecclesiastical courts.

It was the only thing they could do consistent with their faith. The outside world will not, however, find it necessary to prosecute her in the civil courts, because we have found a better way to make witches harmless—that is, to refuse credence to their supernatural powers.

Peaceable Revolutions

THE word *revolution*, and the threat of it, are very freely used in the present political crisis in Great Britain; but only a peaceful revolution is talked of by either of the two parties, whether charged with, or creating, this revolution. Here is an extraordinary thing which demands attention apart from the nature of the revolution itself, that nobody thinks of resisting a revolution by civil war. Hitherto revolutions have been resisted or created by war and much bloodshed. The decision has been by force of arms; by bullets, not ballots. We have had more than one in this country, with many battles. France has had a succession, always with war. But not even the most hot-headed British Liberal or Tory thinks of fighting for or against the submission or overthrow of the House of Lords. They remember the wars of Commonwealth and Monarchy, and they wish no more.

King Edward has tried to put off the crisis by urging the two sides to make some sort of compromise, but neither will consent. The Conservatives declare that the budget, which the Commons will certainly enact, alone would create a revolution, for it adopts the principle of putting the burden of taxation on the rich landholders instead of on the common people, on property instead of on persons. It is hard for us to appreciate the gravity of such a revolution, but the dukes see in it a war on their vast landed estates, which will be followed by division of them. Therefore they threaten to reject the budget, such an act as they have not been allowed to take for two centuries, and which the Liberals declare would be an even greater revolution. Should they reject or alter the bill, the Liberals declare that they will mend or end the House of Lords, and that would be a revolution indeed. Why should a

man have the right to forbid the will of the people because he is the son of his father? Does wealth give the right to perpetuate itself by entail and then add the right to rule? The whole principle of the existence and survival of such an Upper House, so considered, is a travesty on equal rights and modern civilization. At the present time the very existence of the House of Lords, as an "Upper," superior, law-giving body, is at stake, and its overthrow would be a great revolution, and its peaceful overthrow such a novelty as to be almost a miracle. It would indicate a revolution in world thought, the approaching abolition of war as a way of deciding radical differences among men.

But the House of Lords clings to its feudal rights and seems ready to dare the future. Its rejection by a huge majority of the section in the Irish land bill which provided for the breaking up of vast landed estates and their sale to the tenants, is very nearly as serious a blunder and insult as would be the rejection of the budget. Mr. Birrell, Chief Secretary for Ireland, said in a late speech that the Irish land bill is really as important as the budget, and its rejection greatly enrages the Irish people. That brings nearer the Irish Parliament, for Mr. Birrell says that the time must soon come when all purely Irish affairs shall be relegated to Ireland, which means another revolution as far as Ireland is concerned, and probably for all Great Britain; for a local Parliament for Ireland would properly involve three more for England, Scotland and Wales; and then an end to the Established Church, and, we believe, an end to entailed estates. If the Imperial Government can make a forcible purchase of Irish estates to sell to the tenants, it can at least put an end to the entail which settles huge English estates on the eldest son. Even that relief would gradually break up these vast holdings of land as preserves for peasants and pheasants. And that would be, and will be, a revolution.

The world is growing better and wiser. It is learning a better way of making revolutions. It begins to prefer peace to war. Long established privilege finds it must not fight. It discovers the wisdom of yielding to the votes of those who do

not, but might, use the rifle. We may see in the current British political revolution the promise that other nations will learn war no more.

Mr. Hearst's Irruption

The whole country is interested in Tammany and accordingly in the New York Mayoralty. With both amazement and amusement the public is reading the account of the changes in the local campaign, the withdrawal of Mr. Jerome, the sudden irruption of Mr. Hearst as a rival to Judge Gaynor and Mr. Bannard, and the charges of bad faith made against Mr. Hearst by Judge Gaynor, and the reply of Mr. Hearst. We are compelled to say that in both argument and wit the editor has the better of the judge. We cannot see that he had promised to support Judge Gaynor, no matter by whom nominated, even with all the support he gets from the letter of Mr. Block, one of Mr. Hearst's editorial staff, and said to be the intermediary between the two. Even the promise to support Judge Gaynor was, according to Mr. Block, qualified by the words:

"I am not opposed to Tammany, but to Tammany methods, and when it does right it is entitled to credit."

But it did not do right in its nominations, and that Judge Gaynor had not a word to say against them in his speech of acceptance the world knows. We must conclude that Mr. Hearst was not estopped by any promise of his to enter the field, and we cannot but approve his course in accepting the nomination which makes Judge Gaynor's success extremely doubtful, particularly as Mr. Hearst made it a condition that his name should go with the names of the rest of the Fusion ticket. But the most amusing part of the whole matter is left to the end of Mr. Hearst's reply, where he says:

"As for Mr. Block, the 'distinguished editorial associate' to whom Judge Gaynor so respectfully and ludicrously refers, he is the editor of the comic supplement of my Sunday paper, the sponsor for Happy Hooligan, the Katzenjammer Kids and Judge Gaynor. His interest evidenced so peculiarly in Judge Gaynor's candidacy merely goes further to prove that he has a sense of humor, if not a sense of honor."

That is a fine slap at both his own editor

and his competitor. The result of Mr. Hearst's irruption can hardly be to elect him, but it will help the other opponents of the Tammany ticket.

Secretary Ballinger's Modest Fee

The Churchman calls attention to one point in the

President's exoneration of Secretary Ballinger which does not seem to have occasioned as much surprise to him as it has to others. It says:

"Mr. Ballinger, having left the General Land Office in the Department of the Interior under Mr. Garfield, was retained as counsel by those who had been seeking while he was in the Land Office the entry of lands containing enormously valuable mineral deposits. He received from them, the President assures the public only \$250—a surprising valuation of the services of a lawyer who was to succeed Mr. Garfield. The President further states that because of the receipt of this \$250 the Secretary of the Interior did not feel himself competent to deal with the Cunningham claims in Alaska, but left the whole matter to his subordinates. As these Cunningham claims not only in themselves involve more than \$100,000,000, but are typical of other claims which must be dealt with upon the same principles, how can the President retain Mr. Ballinger as the representative of his Administration, or how it is possible for Mr. Ballinger to feel that he is able conscientiously and high-mindedly to administer so responsible an office after thus admitting his pecuniary responsibility to persons who are seeking to secure for a nominal sum invaluable property now belonging to the people of the United States?"

We do not now ask the latter question, but we are both surprised at the modesty of Mr. Ballinger's fee, and we note the delicacy of conscience which forbade him, for that reason, to take the personal supervision of the duty of protecting the people's wealth.

Universities Attacked

While Pius X is warning French Catholics against sending their children to the public schools, Bishop McFaul, of Trenton, N. J., is on every opportunity attacking our American schools and colleges. He says in a late address to his flock:

"Every one knows that it has been repeatedly stated on the best of authority that certain professors in our great secular universities deliver lectures calculated to subvert Christian faith and Christian morality.

"They assert that there is no God, at least as men heretofore conceived of him; no divinely given Ten Commandments; no Church,

and for the Bible, one must be freed from all slavery to the sacred myths which it contains."

No such thing has been "stated on the best of authority," and the bishop ought not to have taken it on the credit of some sensational articles by a man who did not know the meaning of what he heard. This Bishop McFaul is one of the least competent of his order to judge on so serious a matter. He is not a man of thoro education, having turned from an honest mechanical trade to study for the priesthood. We never have heard any such denunciatory language as he indulges in from the really learned prelates, such as Cardinal Gibbons, Archbishops Riordan, Ireland and Keane, and Bishop Spalding. They know better.

More Tainted Money

Under the alliterative warning, "Dangerous Donations and Degrading Doles," Bishop Candler, of the Southern Methodist Church, describes "a vast scheme for capturing and controlling the colleges and universities of the country" which he has discovered, the General Education Board, founded by Mr. Rockefeller with \$43,000,000, and the Carnegie Foundation, with its \$15,000,000, in which he seems to find a scheme of plutocrats to enslave the minds of the coming generation. Thus it is that some are ready to discover evil where only good is apparent. We have never seen the trace of any effort in either of these funds to control education or to warp the minds of either professors or students. But we do see the effort to raise the standard of education and to help any worthy institution that wishes to receive aid. The General Education Board simply gives an amount which may be \$10,000 and may be \$100,000 or more to enlarge an endowment or to erect a building, and no questions asked beyond the quality of the instruction and the need of the institution. All that the Carnegie Foundation does is to give pensions to aged teachers on their retirement, which does not seem likely to affect the instruction in economics, the particular department, we suppose, in which wealth might be supposed to desire to debauch learning. We may be sure that neither of these two endowments would dare to attempt to control

the instruction as a condition of giving aid, as any such attempt would be stoutly resented. We have never heard that John D. Rockefeller's money has influenced the teaching in Chicago University. The professors there have been sufficiently sensational in their criticisms of capital and trusts to satisfy any reasonable person.

A Protest to the Synod

The questions which are involved in the protest made to the synod by a few members of the presbytery of New York are such as have no bearing on human life and duty. They are questions of history and biography, such as whether once Adam and Eve ate an apple and the apple infected the race; and in what way Jesus Christ came into the world. They have nothing to do with our duty and conduct. A decision on them is academic, depending on two things, our theory of inspiration and our interpretation of Scripture. Whether we believe one way or the other makes no difference in our character. If one only loves God and his fellow man that will equally please God, no matter what view he takes on such questions of history or philosophy, particularly considering that God only can know, and such knowledge can be left to Him; for what does He require of us but to do justice, to love mercy, and to walk humbly before Him? We cannot conceive that one who follows Jesus in the practical side of life, and leaves to God the things that are secret as too high for himself, should thereby be unfitted to preach Christ's Gospel to the world. The kingdom of God is character, not theology — the *vivendum*, not the *credendum*.

The Next French Election

In May of next year there will be a general election for deputies to the next Chamber of Deputies, to hold for four years. The present French parliament has done its most historical work in enacting the Law of Separation of Church and State, and in those other acts of legislation which have given so great offense to ecclesiastical officialdom, altho they have been fully supported by the French people. But a new and really

hopeful factor is coming into French politics in the effort to create a Catholic political party, something like the Center party in Germany, which there has had great influence and power, in its alliance with agrarian wealth. The call for such a party has been issued by Colonel Keller, and re-echoed by the Archbishop of Paris, to come together upon a platform solely and exclusively Catholic, for the furthering of a policy which has for its device, "Faith and Fatherland." Pope Pius X has given it his whole-hearted approval, and thru Cardinal Merry del Val has informed Colonel Keller that it "answers completely to the thoughts and desires of the Sovereign Pontiff, who is happy to give it his full and entire approbation." It will be remembered that Leo XIII's support of Count de Mun's *ralliement* of the French Catholics to the support of the republic about two decades ago failed thru the lack of sympathy for the republic on the part of the Royalists and Imperialists; but this effort may be more successful, looking as it does not to the support of the discredited republic, but to opposition to the policy which may be expected from M. Briand. We wish such a party might be formed, for there is danger that the Church will not be left at full liberty, because regarded as hostile to the republic, and it is well to have a compact party of defense against aggression.

Ten Commandments for Rural Health

It is from the Jeanes Fund, established for the general benefit of the colored people, and with the aid of the Public Health Service, that a new table of ten commandments for health in country life has been issued, intended first for Southern negroes, but which may be repeated for whom it may concern of whatever race or color. They are boiled down from a more technical longer draft and are as follows:

"First—Have sand spittoons. Spitting on floors spreads consumption and other diseases.

"Second—Use outhouses with tub or box under seat, which must be emptied at least once a week. Pour oil into the tub to keep insects away.

"Third—Haul away stable manure at least once a week, and let no refuse or stagnant water collect around the house.

"Fourth—Be careful to protect food from flies, for they carry several forms of disease.

"Sixth—Use only pure drinking water, and if it is uncertain whether the water is pure boil it before drinking.

"Seventh—Have plenty of fresh air in the room day and night. Avoid smoky lamps.

"Eighth—Keep away from whisky and all alcoholic drinks, including all patent medicines.

"Ninth—Wash frequently, and be very careful to have fingers clean when cooking or handling food.

"Tenth—Raise and eat plenty of vegetables and fruit, and have a supply of milk and eggs."

A Baptist Jubilee

The Southern Baptist Theological Seminary has just celebrated its fiftieth anniversary with great rejoicings. It has 250 students, and it ought to have many, for it is the only seminary for the Southern Baptists, with the exception of one in Texas. Its first years were spent in Greenville, S. C., but with enlarged funds it moved to Louisville some thirty years ago. We recall the date, for shortly after it was moved to Louisville Professor Toy left the chair of Old Testament instruction, or was removed, and was for a while on the editorial staff of THE INDEPENDENT. Now, after a quarter century of distinguished service in a chair of Oriental Languages at Harvard University, he has retired to enjoy the ease of a Carnegie pension, which allows study, but forbids teaching. The seminary has had other very distinguished teachers, among whom we may give special honor to Dr. Broadus, a man who, we remember, could not recover his love for the nation after the Civil War until, in a foreign land, he was moved by the sight of his country's flag floating over an American consulate. Such men as he, and Dr. Boyce and one other much attacked for his radical views on Baptist history, and with difficulty maintaining his position, have been a great honor to the seminary. The jubilee was graced by addresses from representatives of Northern and Southern theological institutions, not of Baptists alone, but of various denominations, and they did much to illustrate the Christian fellowship and spiritual if not corporate unity. We wish the Southern Baptists were more definitely represented in the Federation of American Churches.

The death is very sad of the Marquise des Moustiers-Merinvillle at sea when within sight of American land. She was one of the two Caldwell sisters who followed their father in joining the Catholic Church. Her marriage was most unhappy, and was succeeded by disease and paralysis below the waist. She separated from her husband, and she and her sister, the Baroness von Ledwitz, both left the Church, and she published a statement denouncing it, which created quite a sensation, particularly as, under the influence of Bishop Spalding, of Peoria, she had been the founder by her immense gifts of the Catholic University at Washington. Bishop Spalding had been her guardian and had officiated at her marriage. It was her earnest desire to die on American soil, but this was denied her. Bishop Spalding, one of the ablest of the American episcopate, failed of appointment as the first rector of the Catholic University, and has seen men of less ability raised to the dignity of archbishop.

Some things we will not believe, no matter how positively they are asserted by partisans; and one of them is that under pretense of a strict interpretation of law our custom house authorities are refusing to admit free of duty old paintings and statues, because the importers cannot give the exact year or month in which they were made. It is much more likely that they wait to make sure that they are not of the multitude of fraudulent antiques, painted and smoked and cracked last year. If our custom house has the expert knowledge to save our collectors from these fakes we shall begin to approve the tariff on works of art.

At Washington and Jefferson College the other day a freshman refused to wear the style of cap ordered by the sophomores, and they sent a deputation to his room to capture him. He had a pistol on his table and made ready to defend himself, whereupon they left. Later they caught him and ducked him until he promised, under duress, to submit, a promise that would not be valid at law. Next he very properly had a number of them arrested for assault and battery, and three were fined; they ought to have been sent to prison like any other hood-

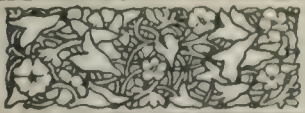

lums. Such lawlessness brings discredit on colleges, and we regret that college officers do not punish it if the courts fail.

So the President has preached another Sunday sermon and has taught our Republican candidate for Mayor of New York the proper reading of the text about the man who ruleth his own spirit. It is a good text, and its applications were excellent, both as to personal conduct and the submission of parties to the will of the people. But perhaps the best of all the points that touch us most closely was that which told the husband to keep a gentle temper and answer sweetly when he returns home at night and his wife wants to know where he has been and what he has done during the day.

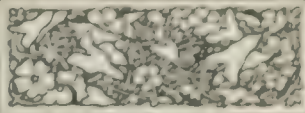

The investigations made by the Lick Observatory on the summit of Mt. Whitney prove conclusively that there is no more water vapor on the planet Mars than there is on the moon. That agrees with the absence of clouds; and with the absence of vapor goes probably the absence of air, as with the moon. But it does not agree with the apparent snow caps and with the changes of the so-called canals. We yet need much further light on this subject. The white snow caps may be formed of carbonic acid. We do not know any kind of living being that does not require both air and water.

We hope that the Colorado Democrat will nominate Mr. Bryan's daughter, or some other competent woman, for Congress, and that the Republicans will do as much, unless they can find a better man. We would not have a woman elected because she is a woman, but because she is the best person for the place; and yet we doubt not there are many women with qualifications superior to those of men who are now members.

We cannot help taking it as a joke that the late mighty Sultan Abdul Hamid should have put on a workman's clothes and tried to escape from confinement. He gets no such sympathy as Napoleon got when he escaped from Elba, and no such pity as followed the French Emperor to St. Helena. The master of massacres is no such hero as the victor of battles.

Insurance

President Dunham on Insurance

At the Eastern Convention of the Travelers Insurance Company, held at the New Mathewson Hotel, Narragansett Pier, R. I., last month, a notable address was delivered by President Sylvester C. Dunham, to which brief reference is here made. Mr. Dunham pointed out that insurance companies have experienced the efforts of many zealous reformers, and set forth that since the New York investigation the aggressiveness of legislators and of those who interpret and enforce their acts has run to extremes. He cited the case of Missouri, where there is a suicide law, encouraging deliberate, fraudulent intent on the part of the man who insures, expecting to kill himself in order that his family may receive large compensation under an insurance policy. Wisconsin, according to Mr. Dunham, has even gone so far as to prescribe methods of bookkeeping and accounting. Continuing, Mr. Dunham said: "Texas passed a law requiring that 75 per cent. of the reserves against outstanding life insurance in that State shall be invested in Texas securities and there held, subject to such excessive taxation as will prevent the companies from keeping up the legal reserve. Altho since modified so as to abate the tax, this law resulted in the withdrawal of twenty-seven life companies which were unwilling to submit to coercion in so important a matter as the investment of their funds. Devised to bring money into the State and to lower the rates of interest, it goes far to accomplish the contrary. During the past year like measures were introduced in five other States. Fortunately, these States, having the experience of Texas as a guide, refused to follow its example. Excessive taxation is a matter of great and growing importance, and the laws regulating the taxation of insurance companies are only too often devised by men not qualified to pass an opinion upon such matters. A Federal tax in addition to the burdens now borne

by insurance companies would not have been enacted by men having adequate knowledge of the facts. On the other hand, something has been going on in the matter of education. People are learning that the tax comes out of the policyholder. For years it used to be said that the tariff was not a tax, but the price paid by the foreigner for the privilege of trading abroad. But people have at last begun to see that it is a tax upon the consumer, and as experience accumulates and as the subject is explained, the policyholder will come to know that the tax upon his premiums is not paid by the company, but by himself. During the last winter there were introduced into the various State legislatures more than 1,250 measures relating not only to solvency and other subjects material to the public welfare, but extending to the details of methods of transacting the business, including bookkeeping. Fortunately, few of these 'reform' measures were passed. But those who represented the interests of the companies, which were also the interests of the people, had a vast amount of writing and talking to do to show that laws making the companies responsible for the fraud of agents, declaring insurance in force at and from the time the application is made, compelling investments in local securities, regulating the compensation of agents and officers, forbidding the resistance of unfounded claims, increasing already burdensome and unequal taxes, and the like, were oppressive and unjust."

DISPATCHES from Rome state that the Black Hand has added underwriting to the other enterprises heretofore conducted by that organization. This is very lucrative, as no losses are ever paid

FROM figures given in the London statistics for 1908-09, which have just been published by the London County Council, it appears that the total insurance against fire in London is \$5,000,000,000.

The Crops

LAST week's report from the Government concerning grain and certain other farm crops was quite favorable. Good weather prevented any serious injury to corn, and the October figures indicate a yield of 2,648,846,000 bushels, a quantity that is within 275,000,000 of the record crop of 1906. Spring wheat shows a larger total (291,848,000) than was expected, and the entire crop of wheat is 724,768,000 bushels, against last year's 664,602,000. In only two years (1901 and 1906) has the present crop been exceeded, and the excess for those years was small. The yield of oats, 983,768,000 bushels, almost reaches the billion mark and may be compared with last year's 807,156,000 bushels. Only in 1902 was there a larger crop, but this year's harvest falls only 4,000,000 bushels behind that highest record.

The cotton report issued four days earlier was less satisfactory, as it showed an average condition of only 58.5, against 69.7 for the same date in 1908, and a ten years' average of 67. It is expected that the crop will be about 11,000,000 bales. Last year's (the largest ever grown) was 13,828,000. The chief cause of poor condition has been an excessive rainfall in the early part of the season, followed by drought. In addition, it is said that planters were unable to procure advances from bankers and therefore reduced the number of persons employed at the time when a full force was needed for work against the boll weevil.

Owing to the high price of cotton, there is now a world-wide movement for reducing the output of cloth. For raw material that was sold last year at 9 cents, or a little more, the manufacturer must now pay at least 13 cents. Work hours have already been reduced in England, and a decision has practically been reached in this country that a similar reduction shall be made here. Manufacturers are unwilling to raise the prices of finished goods in proportion to the present price of the raw material. It is by no means clear, however, that a slight reduction of the manufactured output

will cause any considerable reduction of the price of cotton.

Signs of Activity

FURNACE output is the most impressive indication of the prevailing great activity in the iron and steel industry. In September, 2,385,206 tons of pig iron were made. The highest record before the effect of the panic was felt (2,336,972 tons, in October, 1907) has been surpassed, and at the end of September the output had risen to the rate of nearly 2,500,000 tons per month. Prices are still advancing, and foundry grades are so difficult to obtain that four cargoes were ordered last week from England. "The whole industry," says the *Iron Age*, "is under tremendous pressure." Among other indications of general activity are the bank clearings, larger last month than in September of any previous year; the increase of the Atchison road's dividend and a reduction of the number of idle freight cars to 38,806, from 277,000 in June, 300,000 in February, and 332,000 in January. In the stock market, excessive speculation and higher rates for money have caused a reaction. The price of Steel Corporation common shares, which had risen to 94 $\frac{1}{2}$, showed a loss of 5 $\frac{1}{2}$ points at the end of last week, after transactions that in volume were almost without precedent, amounting to 633,000 shares in one day and to 2,160,600 for the week, out of a total of 5,062,800 for the entire list.

... The new stock of the Canadian Pacific Railway, \$30,000,000, is to be issued at \$125 per share.

... The Pennsylvania Railroad Company will maintain a farm at Bacon, Del., as an experiment station for the benefit of farmers on the peninsula, where there are about 1,800,000 acres of idle land. It is expected that the work of this experiment station will draw competent farmers to this land and cause the profitable cultivation of a considerable part of it.

The Independent

VOL. LXVII NEW YORK, THURSDAY, OCTOBER 21, 1909

No. 3177

Survey of the World

The President's Tour

After three days of sight-seeing in the Yosemite Valley, the President started for Los Angeles. At Merced he stopped for three hours on Sunday, the 10th, and attended services in the Presbyterian Church. That afternoon, at Fresno, he spoke in the public square at a meeting held under the direction of the local clergymen, taking for his text "He that ruleth his spirit is greater than he who taketh a city," and pointing out that popular government can be successful only when the people exhibit sound common sense and self-restraint. Majorities should be just to minorities. They should be good winners, as minorities ought to be good losers. Popular government was a failure where beaten minorities "took to the woods," and revolutions followed elections. Twenty-six nationalities were represented in his audience. The Japanese residents of Fresno gave him a memorial, expressing their respect and good will. Arriving at Los Angeles in the morning, on the 11th, he inspected the new breakwater at San Pedro and the improvements in progress in the inner harbor. In Los Angeles there was a parade in brightly decorated streets, with flowers in profusion everywhere. In the evening he was the guest of honor at a grand banquet. The President's sister, Mrs. Edwards, is a resident of the city. The night before his arrival there was a meeting, the despatches say, of anarchists and socialists at which President Taft and President Diaz were publicly denounced. Six Mexicans who thus offended were arrested. Joseph Czolgosz, brother of the man who shot President McKinley, is engaged in business there and is a law-abiding citizen.

He asked the Chief of Police (a personal friend) to lock him up, so that he might avoid annoyance. The chief refused to do this, and Czolgosz remained in the Chief's office while the President was in the city. On the 12th, the President went to Pasadena, San Bernadino and Riverside, and looked at the orange groves. At Sawtelle he greeted 2,600 veterans in the Soldiers' Home. Leaving Riverside that night, he arrived in Phoenix, Ariz., the following day. There he spoke in favor of separate statehood for the two Territories, saying that this had been promised in the Republican platform. He urged the people to use great care in making a Constitution. This, he said, should be simple and should provide only the fundamental limitations for legislation and executive action. They should profit, he added, by the errors of Oklahoma, whose Constitution he called "a zoölogical garden." The Constitution of a State should not prescribe the length and breadth of sheets used in hotels. He spent the following day on the rim of the Grand Cañon. On the 15th he was at Albuquerque, N. M., where he repeated his speech about statehood. One of the local speakers at a banquet there intimated that the statehood plank had been put in the platform only as the price of the exclusion of an anti-injunction plank which Mr. Gompers had demanded. Mr. Taft met this earnestly and emphatically, saying that there had never been any chance for the acceptance of the Gompers plank. At Laguna, a village of Pueblo Indians, the President remained for a time and saw a peace dance. In Albuquerque, an old prospector named Thorpe approached a policeman and

and Alonzo (the latter) I want to kill him." The man was arrested and he is supposed to be insane. While the President was passing thru the Territories, President Diaz was moving northward to the boundary, and troops were assembling on each side of the Rio Grande near the point where a memorable meeting was to take place.

The Meetings at El Paso and Juarez

President Taft arrived at El Paso on the morning of the 16th. President Diaz was at Juarez, about to make that brief visit in foreign territory for which permission had been granted by the Mexican Congress. Having been the guest of the El Paso Chamber of Commerce at breakfast, Mr. Taft awaited the President of Mexico in the Chamber's building. President Diaz came to the boundary in a state carriage, the hubs of which were gold. He wore a glittering uniform, and on his breast were many decorations and medals. At the boundary he alighted and then entered a plain American carriage. Following a salute of twenty-one guns, he had been greeted formally by Secretary Dickinson, who remarked that he was the first Chief Executive to cross our border, and characterized his action as the highest manifestation of the cordial relations existing between the two republics. At the beginning of the interview between the two Presidents about twenty persons were present, among these being Secretary Dickinson, Postmaster-General Hitchcock, Governor Campbell and two members of the Mexican Cabinet. Then for fifteen minutes the two Chief Executives, accompanied by Governor Creel (as interpreter, because President Diaz spoke in Spanish), were by themselves in another room. No matters of international policy were discussed. The conversation in public was highly formal, abounding in compliment and expressions of cordial good will and admiration. Soon after the departure of President Diaz, the American President was escorted to Juarez, where there was a similar interview in the custom house. Again the remarks were mutually complimentary. Juarez was elaborately decorated. For

weeks the work of improvement had been in progress. The custom house had been rebuilt. Carloads of flowers had been brought from the Mexican capital. Mr. Taft returned to El Paso, reviewed a long parade, and then, at 5.30 p. m., crossed again to Juarez, where he was the guest of honor at a grand banquet given by President Diaz in a hall made for the purpose. The latter had brought his *chef* from the capital, and even the ranges used in cooking had been sent from that city. Upon the tables was the Emperor Maximilian's gold and silver service, valued at \$1,000,000. The two Presidents sat side by side. Their speeches were brief and were given as toasts from one to the other. President Diaz, having said that the visit of his guest would mark an epoch in the history of Mexico, continued:

"We have had some very eminent American visitors, such as General Ulysses S. Grant and the Hon. Messrs. Seward and Root, but never before have we seen on our soil the First Magistrate of the great American Union. Such a proof of international courtesy, which Mexico appreciates and esteems in all its worth and meaning, will be from today a happy precedent for Latin American republics, stimulating them to cultivate constant and cordial relations among themselves, with us, and with all other countries of the continent."

He then expressed the hope that the country of the immortal Washington might always enjoy "all the happiness and prosperity which justly correspond to the intelligent activity and high qualities which characterize the manly and cultured American people." Responding, President Taft expressed, for the American people, their "admiration and high esteem for the great, illustrious and patriotic President of Mexico," and also their friendship for the Mexican people:

"Your Excellency, I have left the United States and set my foot in your great and prosperous country to emphasize the high sentiment and confidence, the feeling of brotherly neighborliness which exists between our two great nations. The people of the United States respect and honor the Mexicans for their patriotic devotion, their will, energy, and steady advance in industrial development and moral happiness. The aims and ideals of our two nations are identical, their sympathy mutual and lasting, and the world can be assured of a vast neutral zone of peace in which the controlling aspiration of either nation is individual and human happiness."

Mr. Taft left El Paso that evening at 8 o'clock for San Antonio, about 600 miles eastward. In Chicago, on the 15th, there was published a story asserting that Secret Service men had discovered a plot, made by anarchists in that city, for the assassination of both the Presidents. Chief Wilkie, of the Secret Service, promptly said this was not true.

The Dismissal of Minister Crane

Charles R. Crane, Minister to China, who was called back to Washington from San Francisco when about to sail for his post, had an interview with Secretary Knox on the evening of the 10th. Two days later he was virtually removed, the Secretary asking for his resignation. In an explanatory statement the latter said that the State Department had for some time been making a study of the recent agreements between China and Japan, to ascertain whether they were in conflict with the principle of equal opportunity to which the Powers are pledged, but had reached no decision:

"While this investigation was proceeding, Mr. Crane, the Minister to China, came to the Department, and, while there, was informed by one of the clerks that such an examination was being made. Without consultation with the acting Secretary, or any other responsible officer of the Department, and without the knowledge or authority of any one connected with the Department, Mr. Crane gave out a newspaper story to the effect that this Government was preparing to protest against some features of the agreements, and that the promulgation of the protest only awaited the return of an official who was to formulate it. The story appeared in a Western paper, and at the same time, or a day later, in the Japanese press, and subsequently was generally published."

Therefore, Mr. Knox continued, he recalled Mr. Crane, saying to him in a telegram that he had been charged with "responsibility for the canards recently appearing in the Japanese and American press to the effect that the United States is preparing to protest against the Chinese-Japanese agreement," and directing him to return and meet the charge:

"At a conference with Mr. Crane Sunday evening he admitted having an indiscreet talk with a reporter which resulted in the publications referred to, and, assuming responsibility, stated that if the indiscretion was grave enough to shake my confidence in his usefulness he would willingly resign. I have reluctantly reached the conclusion that the good

of the service demands that I should inform Mr. Crane that his resignation will be accepted, and I have done so."

Whereupon Mr. Crane published a long statement. He had not, he said, "given out a newspaper story," but a brief conversation of his with a newspaper man had contributed to the publication by the latter of a discussion of the agreement and of the possibility of a protest by the United States. This publication would not have been a mistake if the Department had not "chosen to vouch for its accuracy and give to it an official significance." The article in question (published in Chicago on September 27) contained "nothing of substance which was not matter of common knowledge and deducible by any competent newspaper reporter from facts commonly known." The President had advised him to speak at public meetings and dinners upon the Pacific situation, saying: "Do not miss any of them, and when you go to one insist upon speaking and let them have it red hot." He had received no specific instructions from the Department, nor had there been any adequate discussion with its officials as to policy. He had been unable to consult with Mr. Knox, and his efforts to arrange interviews with the Assistant Secretary had been unsuccessful:

"As I was hurriedly leaving Washington a representative of an important paper asked me about the China-Japan agreement, and I said that the matter was under consideration, as was well known, but that no decision had been reached, and I may have said, altho I do not recall it, that obviously no statement would be prepared in the absence of Mr. Hoyt. I advised him to get thoroly informed upon the whole subject, as it would be of the greatest importance that it be handled intelligently by the American press if official action were taken. This is the sum of my offending. On mature consideration it is my judgment that my action was in accordance with the spirit at least of the President's wishes, expressed by him to me and that it furnishes no sufficient excuse for the sensational and inconsiderate action of the Secretary of State."

He had placed his resignation in the President's hands, saying to him that no mistake had been made, except by the Department, and that the conduct of the Department was inconsistent with his self respect, his conception of the dignity of the position, and the understanding upon which he had accepted it. On the 14th, in a brief telegram the President said to Mr. Crane that he con-

curred" in the letter addressed to the latter by Mr. Knox. "I greatly regret," he added, "that the circumstances found to exist by him make it necessary for me to accept your resignation."

Revolution in Nicaragua

What promises to be a successful revolt against the Government of President Zelaya in Nicaragua originated in Bluefields at midnight on the 10th. The leader of the revolutionists is Juan J. Estrada, governor of the province which includes a majority of the Atlantic Coast towns. The four Estrada brothers have been prominent in Nicaragua. They were Zelaya's most powerful supporters in the movement which gave him the presidency. He made Juan governor of the Province of Zelaya, appointed Aurelio commander of the army and placed José in the Cabinet. The fourth brother, Chamorra, now commands the main body of the revolutionary army, and Aurelio is reported to be leading a considerable force against the capital. On the 15th the revolutionists were in possession of all the Atlantic Coast towns and also of Corinto, the chief port on the Pacific, where the people had accepted the rule of Juan Estrada. His followers had elected him Provisional President. As the revolutionary troops moved toward the capital from the Atlantic Coast, the people welcomed them. At the end of last week, 3,000 Nicaraguan and Honduran exiles were on their way from Costa Rica to join Estrada. They are under the command of Juan Reyes, who has been the foe of Zelaya for many years. In an official statement Zelaya asserts that the revolt was instigated and is now supported by President Cabrera, of Guatemala, who, he says, has furnished the arms and ammunition. Some think that Honduras will be involved, because the people there are ready to rebel against President Davila, whom Zelaya placed in office. Zelaya, who has sought for several years past to obtain control of all the Central American republics, recently promoted the candidacy of Ricardo Jimenez for the Presidency in Costa Rica. At first Jimenez appeared to have been elected, but the courts last week annulled the

election in the province of Limon, for the reason that many Nicaraguans had voted there in Zelaya's interest, having come in boats. It is alleged that Zelaya recently negotiated a loan of \$6,250,000 in Europe and has not accounted for the money. He has also increased the tariff duties and imposed oppressive taxes. Estrada proclaims the abolition of these and a reduction of the tariff by one-half. —In Santo Domingo, on the 11th, a revolutionary movement was begun near Monte Christi, on the north coast, under Generals Navarro and Rodrigues. The Government asserted that it was an insignificant affair, but late reports say the revolt is growing, and that in one or two engagements the Government troops have been routed.

The Philippine Islands

Colonel Hoyt, of the Twenty-fifth Infantry, formerly commanding officer of the Department of Mindanao, recently resigned as civil Governor of Moro Province. In his final report to the authorities at Washington he urged that laws should be enacted for a permanent separation of the southern islands, including Mindanao, the Sulu group and Palawan, from the remainder of the Philippine archipelago. These islands, he said, should be declared "territory of the United States," and should have a civil-military government like the present government in Moro Province, with a policy so plainly expressed that it would settle any question of independence or of political agitation for annexation to the northern group:

"The Moros have no conception of representative government, or the meaning of independence, having no word in their language to give it expression. We have not yet built up a state, or reached the mass of the people in any general uplifting movement. The little red schoolhouse has been started, but instructions languish for want of trained teachers, or the desire of the natives to profit by or appreciate the advantages of education. The mainstay is the law of the land—peace would be impossible without the actual presence of troops—for this country is neither ready for nor has it ever known any other form of government. The civil-military government, in which the government controls the army forces, is indispensable now, and will be for generations to come. A purely civil government is quite impossible, and, at present, would carry with it untold misery and suffering."

—It was reported on the 8th that twelve Chinese merchants had been illegally deported from Manila to China, and that the Chinese Consul-General, as well as the Philippine authorities, had approved the unlawful act. It was said that this forcible expulsion was due to the commercial rivalry of two groups of resident Chinese. It is now explained, however, that the deported men were blackmailers whom Chinese merchants desired to drive out of the islands, and that the Philippine authorities had no knowledge of the deportation, altho it had been approved by the Chinese Consul-General.—Baguio, the mountain capital of Benguet, has been selected as the site of the proposed naval sanitarium. —Thirty-six of the cigar-makers who recently went on strike in Manila for higher wages have been arrested for criminal conspiracy. It is alleged that each had signed an agreement permitting his associates to kill him if he should desert them.

Ferrer Executed Francisco Ferrer, the founder of the so-called "Modern Schools" of Barcelona, was found guilty of complicity in the Barcelona riots and was executed on the morning of October 13, in the fortress of Montjuich. The trial was held by court-martial and was open to the public, but was not conducted in accordance with our ideas of the laws of evidence. No witnesses were called; the evidence was by affidavit and consisted mostly in the quotation of incendiary utterances from Ferrer's speeches and editorials; the aim of the Government being obviously to take advantage of the opportunity to get rid of a dangerous man. The ease with which the revolutionary manifestations of the last week in July were put down has given the Government confidence in its power of dealing with anarchy. In Catalonian towns, where a republic or commune had been proclaimed and held sway for a week or more, the advent of a few soldiers or policemen was sufficient to restore order, and usually no resistance was offered. Notwithstanding the general dissatisfaction in Catalonia with the Madrid Government, the violence of the revolution

ists lost them the sympathy of the public from the start. Altho it is impossible to get the exact truth from Barcelona, it appears that the execution of Ferrer aroused less public indignation there than in other countries: Personally, however, he was highly esteemed; a philosophical anarchist of the type of Krapotkin and Elisee Reclus, sincere and self-sacrificing, but not hesitating to advocate violence for the overthrow of Church and State. He devoted his life to the cause of secular education in Spain, translating scientific and radical works into Spanish and establishing in the vicinity of Barcelona over one hundred of his Modern Schools, all of an elementary character, but designed to lead up to a secular university. The death of his first wife left him with the fortune of half a million dollars, practically all of which he spent in this work, and his daughters are left to support themselves. The character of the teachings in the Modern Schools may be indicated by this quotation from one of the textbooks:

"Society today is divided into the privileged and the disinherited. The former usurp everything, while the latter die of hunger. That capital should appropriate the fruit of the workman's labor is an injustice supported by the law. Religious education inculcates falsehood and teaches foolishness. The soldier's uniform conceals crimes against humanity and the misery of his own existence. To maintain order is to maintain injustice against the workman. All religions are based on ignorance and imposture, and aim at exploitation and oppression. The Gospels relate the life of the so-called Jesus Christ, and it is truly a misfortune that such ideas exist for the deceiving of the people."

On May 31st, 1906, when Morales attempted to kill the King and Queen of Spain at the time of their marriage, an effort was made to implicate Professor Ferrer thru the fact that Morales was protected in his flight by Nakens, a radical politician, who had been associated with Ferrer. Nakens was sent to prison for nine years, but the trial produced no evidence of the complicity of Ferrer in the attempted assassination. The decision of the court-martial of Barcelona was reported to the Cabinet and approved. Many appeals and threats were made to the King for a reprieve. Ferrer's daughter telegraphed to King Alfonso from Paris, begging mercy for her

father, and it is reported that Pope Pius X was opposed to the infliction of capital punishment in this case. Anarchists of Spain and other countries openly proclaimed that the King would be assassinated if Ferrer were executed. Alfonso, however, refused to pardon him or mitigate the sentence. Ferrer bore himself at the execution with calmness and dignity. When brought before the firing squad he refused to have his eyes bandaged, altho the general in charge declared "a traitor has no right to look upon the faces of soldiers." He fell at the volley of the twelve soldiers and was buried in the common ditch.

✱

Demonstrations of Sympathy

The execution of Dr. Ferrer excited the resentment of anarchists and radicals the world over, and in many European cities sympathy took the form of riotous demonstrations. So far as is known there have been no serious riots in Spain, but it is reported that many bombs have been thrown in Barcelona within the last few days, killing and wounding a number of people. Notwithstanding the critical condition of Spanish politics at this time, the Cortes was convened at Madrid on the 15th. As soon as Premier Maura entered the Chamber of Deputies he was met with shouts and violent epithets from the Republican members. For a long time the President of the Chamber was unable to quell the disorder and the ushers had difficulty in preventing personal conflict between the radical and conservative members. Similar scenes took place in the Senate and in the Municipal Council of Madrid. Premier Maura promised to submit the papers of the Ferrer case to parliament, and assured the deputies that no illegal or unprecedented action had been taken. The Government asked for a credit of \$13,600,000 for the prosecution of the war in Morocco, to the end of the present year. In order to raise money the Government has introduced a bill abrogating the requirement of universal military service and permitting exemptions on the payment of \$300. — The anarchists of Barcelona have always been in close relations with those of sim-

ilar views in Paris, and here the most violent demonstrations have occurred. The mob at first attempted an attack upon the Spanish embassy in Boulevard de Courcelles, but were headed off by the police. They then turned their fury toward the Church of Sacre Cœur at Montmartre, but were repulsed, not so much by the efforts of the few policemen on guard as by the six big police dogs who, turned unmuzzled on the mob, chased them down the church steps and thru the streets. Some attempts were made to erect barricades, but owing to the fact that the streets of Paris are now paved with asphalt and wooden blocks instead of stone, the rioters were not able to follow the usual revolutionary tactics. They confined themselves to smashing windows, overthrowing busses and kiosks, and breaking down lamp posts and lighting of the gas escaping from the pipes. One policeman was killed and seventy-nine wounded. Injury to the rioters by the charges of the police and soldiers is not known. The most serious feature of the affair was the large number of apaches and other criminals who took advantage of the darkness and disorder for the purpose of loot. M. Lépine, Prefect of Police, was, as usual, to be seen unarmed in the thickest of the mob. Several times he had a narrow escape from death, but his unfailing courage and good nature rendered him immune. His skill in the control of the mob saved Paris from serious damage and perhaps an insurrection. The Paris demonstrations were organized by MM. Jaurés, Hervé and Vaillant, socialist and anti-militarist leaders. — In Rome immense outdoor meetings of protest were held, and the execution of Ferrer has stimulated an anti-clerical movement which seems likely to have important developments. The Grand Master of the Free Masons has issued a violent manifesto against the Church, declaring that Rome must be punished for this latest instance of ecclesiastical tyranny. Funds are being collected to establish a modern school of the Ferrer type, directly opposite the Vatican. Demonstrations took place in many of the Italian cities, accompanied by more or less disorder. At Pisa an attack was

made upon the cathedral, but the burning of one of the doors was the only damage done.—At London a mass meeting was held in Trafalgar Square, addressed by the socialist and labor leaders, including several members of Parliament. A movement of the mob toward the Spanish embassy was checked thru the efforts of the police.—Mass meetings and street demonstrations are also reported from Berlin, Brussels, St. Petersburg, Lisbon, Vienna, Zurich, Havana and many South American cities.—In New York a meeting was held in Clinton Hall, on the East Side, addressed by Emma Goldman, Alexander Berkman and other anarchists and sympathizers with Ferrer.

The Cook-Pearry Controversy Commander Peary and his friends have brought forward during the week evidence very damaging to the credibility of Dr. Cook. A statement signed by Robert E. Peary and four of his companions, gives the results of their cross-examination of the two young Eskimos, I-took-a-shoo and Ah-pe-lah, who accompanied Cook. According to their story, Cook did not pass beyond the edge of the land ice to the north of Axel Heiberg Land. They traced upon the chart the route taken by them, which agrees with that given by Dr. Cook, with the exception of his alleged dash for the Pole from Cape Thomas Hubbard. In their expeditions from the land, the Eskimos said they carried only small amounts of provisions, leaving the rest in caches to which they returned. They crossed no open leads to the north of Cape Hubbard and killed no bear or seal there, and made no caches on the ice. They had only two sledges and twenty-six dogs. Accepting Dr. Cook's statement that he started out with 800 pounds of pemmican and 200 pounds of other provisions, it is calculated that the three men must have subsisted on about 8 ounces a day, which is an impossible ration in Arctic work. In this estimate an allowance is made for the sixteen dogs eaten by the other ten. Dr. Cook's only reply to this evidence and criticism is that he directed his Eskimo boys not to tell Peary that they

had been to the Pole, and it seems in fact that they had been loyal in concealing the information. Knud Rasmussen, the Danish-Eskimo half-breed, who went north to interview Dr. Cook's companions, was not able to reach Ambootok but at North Star Bay he met some Eskimos who had conversed with them and they report that Dr. Cook's Eskimos say he reached the Pole and describe his rejoicing at the achievement. The Eskimos appeared to be afraid that Commander Peary would return and take their provisions.—Popular faith in Dr. Cook has been still further shaken by the evidence adduced that he did not ascend Mount McKinley September 16, 1906, as he claimed to have done. Edward N. Barrill, the guide who remained with Dr. Cook after the rest of the party left, has been brought to New York by the Peary Arctic Club, and has made an affidavit that he and Cook did not ascend the mountain, and that the narrative published in Cook's book, "To the Top of the Continent," is fabricated. Barrill states that he falsified the record of the trip into his own notebook in accordance with Dr. Cook's instructions, and had kept silence on the subject ever since at his request. According to his testimony they did not come within 14 miles of the summit of Mount McKinley, and at no time reached an elevation in excess of 10,000 feet. The photograph of the summit of Mount McKinley published in "To the Top of the Continent" (reproduced in THE INDEPENDENT of September 9, page 573) was made of another peak not over 8,000 feet high. Dr. Cook having placed Barrill with a flag on the summit, and then retraced his steps to a lower level, where the photograph could be taken without showing the higher mountains surrounding. When the Barrill affidavit was brought out Dr. Cook denied it and proposed to organize an expedition to ascend Mount McKinley in order to find the flag and documents left in a small metal box near the summit. He has requested Anthony Fiala, the Arctic explorer, and Prof. H. C. Parker, of Columbia University, who accompanied him on the first part of the McKinley expedition, to undertake the task of finding the records left on the summit.

The Awakening World*

BY WILLIAM T. ELLIS

[Mr. Ellis, who is on the editorial staff of the *Philadelphia Press*, has lately made a tour of the world to investigate social, political and religious movements.—EDITOR.]

FOR all its bigness, this world is one world. Geographers have long known that certain great currents sweep thru the waters of the earth. Science has lately demonstrated that there are hitherto unsuspected electrical properties in the ether above us which makes it possible for continent to flash messages to continent, conducted only by the mysterious cords that encircle this globe. Modern aeronautics are discovering that there are certain major and staple currents of air, which girdle the earth, recking nothing of nations and little of continents. I chanced to be within sight of Asama-yama, Japan's greatest volcano, upon the occasion of the Valparaiso earthquake, and there, in Japan, on the other side of the earth, Asama was exhibiting sympathetic disturbances with Valparaiso, even as it had done when San Francisco was shaken. The unity of the natural world is written in air and earth and water and fire. And mankind likewise has an essential unity, for "He made of one every nation of man to dwell on all the face of the earth."

Remarkable comments have been made upon the present astonishing changes that are rapidly taking place in the universal family. Historians like the Hon. James Bryce, who have long thought in world terms, perceive that this day is like unto no other day upon which the sun has ever shone. Amazing transformations are taking place before our eyes. The day's newspapers are casually recording, but seldom interpreting, changes as momentous as the fall of Rome or the Norman invasion of Britain. Said Dr. Bryce, before the lay-

men's convention of the Southern Methodist Church in Chattanooga: "Things which have lasted from the Stone Age until now are at last coming to a perpetual end. They will vanish from the face of the earth. This is a phenomenon which has never happened before, and can never happen again."

The startling awakening of the world to a realization of its own compactness and community of interests has been happily phrased by ex-Mayor David P. Jones, of Minneapolis, who calls it, in the terminology of modern mechanics, "the standardization of the world." The railways of the whole earth are being run on standard gauge; and the locomotives made in Philadelphia travel thru Korea and China and Siberia. A Universal Postal Union covers practically everywhere. Even the dress of widely separated peoples is gradually coming to an essential conformity. The same code of international laws now governs all nations. The standards of civilization are being rapidly imposed upon the lands which a generation ago were called "hermit nations."

Under the pressure of the new sentiment for standardization, which is being felt thruout the earth, certain conditions which have been tolerated for hundreds of years, even for milleniums, are now disappearing. Uniform laws of moral and social sanitation and hygiene now run to and fro over the whole earth. The ancient civilizations no longer are permitted to go their own way, unchallenged and unquestioned. Since they have moved into the world neighborhood, they are required to abide by the laws of good neighborliness. Even as Japan

*Copyright, 1909, by William T. Ellis

no longer allows her lepers to travel at large thru the community, because of the pressure of Western sentiment, so she, and the other peoples of venerable history, no longer feel free to tolerate social and moral practices which run counter to the ideals of the West. This is the price paid for the new compactness of universal human society.

Of the factors contributing to this extraordinary condition it is not necessary to write at this point; but attention should be called to the remarkable fact of the prevalence of the English language, especially among the largest and oldest nations. French has long been esteemed the language of diplomacy, and it still widely prevails in continental Europe. But elsewhere English has the right of way. One may journey over all the main-travelled roads of earth, speaking no other tongue than English. Why should not China and Japan and Korea have learned French or German or Russian? That India should master the speech of the nation that rules her is not remarkable; but that English should be taught in the new schools of these other ancient peoples is a marvel of providential significance. For it means that the Christian ideals which the language embodies are to be dominant in the reshaping of these civilizations of antiquity. The immense responsibility, along with unprecedented opportunity, thus laid upon the shoulders of the English-speaking peoples should cause the truth of "*noblesse oblige*" to be pressed heavily home to the intelligence of every alert man who speaks the tongue of Carey and Livingstone and Morrison and Martyn and Verbeck and Underwood. Discriminating Christians cannot be blind to the significance of this situation, which puts the great majority of mankind under the tutelage of the English language. A British statesman recently called this one of the most remarkable facts of human history.

All the co-ordinating forces mentioned simply prepare one for a clearer contemplation of the present phenomena of the whole world's awakening. Before an attempt to outline the latter even the boldest pen pauses. Changes are being effected in the Orient that

seem like the work of a magic wand. A close study of them is one of the most alluring and engrossing interests possible to a cultivated mind. To be a spectator in the theatre of to-day of this world drama is a high privilege: to be an actor therein—which is permitted to all who have a part in the missionary agencies now operating—is a rare honor.

The torpor from which the nations are awakening was well described by Rev. G. A. R. Janvier, D. D., in an address before the Birmingham Convention of Southern Presbyterian Laymen. Pointing to a gigantic map of the world which hung on the wall he said:

"Begin on the west coast of Africa with what, on that old map, is still called the great desert of Sahara, but parts of which we know to be teeming with millions who call to us for light. Pass right across Northern Africa to Turkey in Europe, then thru Syria and Arabia and Persia, across Afghanistan and India, Burma and Siam, China, Korea and Japan. If you had looked that way a few years ago, what would you have seen? A great chain of sleeping nations, sleeping the sleep of death; a pall of sluggishness and hopelessness resting over them all; a lethargy such as no one can know, except those who come into contact with it—no public life, no public spirit, no public institutions, no deep feeling on any subject—one sweep of deadly indifference from east to west and west to east."

Now, behold the marvel! Japan, only fifty years away from her resolute insulation, is a first-class world-power, with a population as keenly alert to current issues as any other people on earth. After her half century of marvelous political, economic and social transformations, we find her a nation on the *qui vive*, profoundly discontented with what she has gained, and reaching out groping hands for some new sovereign specific that will bring peace to the hearts of her restless, dissatisfied people. Careful observers have ventured to say that the political, social and religious crisis of Japan today is graver than the epochal period of half a century ago.

A generation since, the reading public heard of Korea as it heard of the pygmies in the African forests—a strange people, utterly apart from the main stream of life, and never likely to have more than a curious interest for civilization. Since then a portentous and map-changing war has been fought over

Korea, and the "Hermit Nation" has become a concern of all the great chancelleries of the world. In the mean time, the entrance of Christianity, and its marvelous growth, amid this arrested nation, has challenged the interest of Christendom, and a type of discipleship has developed which has set the oldest Christian churches to praying for like graces and blessings for themselves. One scarcely dares prophesy what will be the part of this young Christian giant in the evangelization of the Orient. In the mean time, out of the sleep of millenniums, Korea has awakened until every fiber of her being is a-tingle with new life.

When it comes to China, with her four hundred millions of people, one is tempted to abandon any attempt to convey even the most superficial impression of the seriousness of her present crisis. China's awakening is portentous. It is marvelous. It is indescribable. It is incredible. It is limitless in its influence. For the sake of the world today—for the sake of the next generation—for the sake of China herself, some new prophet-watchman should ascend the housetops of civilization and cry aloud with megaphonic voice: "China is awake! *China is awake!!* CHINA IS AWAKE!!!" The biggest of all nations—the people with the greatest latent powers—the heirs of tomorrow—have started to school to learn all the ways and weapons and wisdom of the West. This is the news of the day that most deserves "scare heads" in the newspapers. Here is the subject upon which every wise man will inform himself and instruct his children. Let a man wear his last year's coat, if need be, so that he may buy the latest and best books about China.

Before sailing from China to India, that scene of bewildering ferment, the observer should look in upon the Philippine Islands, the unexpectedly acquired outpost of the United States. Here is another awakened nation, making giant strides forward to overtake the march of civilization, behind which it has ever lagged. Many of the characteristics which mark new Japan, new China, new India and new Turkey are to be found among the Filipinos. The remarkable system of general public education which

the Government has provided, and the widespread and popularly received new evangelization, and the measure of self-government already put into operation, afford the new life of the people unusual channels for expression, so that the moral, social and material progress of the Philippines is a phenomenon scarcely understood by the American people generally.

Since the restlessness of India has taken to expressing itself by bombs, pistols and boycotts, the world at large has developed a considerable interest in it. While not so ominous as the fundamental processes of change at work in China, the swift awakening of India to a new sense of national unity and of national aspirations has already given the British Government gravest concern, and it is inevitably fraught with serious and unpredictable consequences. Today India, like all the East, is quiveringly alive and alert, and insistent in demands upon the governing nations. Her needs by no means correspond with her desires, but the former will eventually have to be met; and the meeting of these is part of the new world-man's task.

With a touch of scorn in his voice, the Gentlest of all teachers once cried to the learned of his day: "Can ye not discern the signs of the times?" Contemplating the languid interest, the comparative indifference, of Christendom in the Turkish Empire's *volte face*, one is tempted to challenge it again with those words of its Lord. In the spectacular triumph of the Young Turk party, the last national citadel of religious intolerance fell to the ground. What a great day was that for liberty! All the angels which have brooded protectingly over the cause of Christian civilization must have shouted in exultation when the revolution in Turkey triumphed. Some great poet is needed to interpret to the world at large the mighty meaning of this event. It signifies more than one nation's awakening; it inaugurates, in the land where Jesus and His Apostles gave to the world great and patient truths which must ultimately be universally victorious, a reign of freedom which lifts the heavy hand of bigotry from all the sacred places of Christian history, and makes easy the return of the Gospel to the regions of

its birth. That revolution was also a sword-thrust at the heart of Islam, of which the latter will ultimately perish. Notwithstanding these staggering consequences, multitudes of intelligent, Christian men remained more interested in the tariff debate, and in the Cobalt mines, than in Turkey's upheaval.

The roll call of awakening nations is too long to finish here. Old Egypt is swiftly shaping into new Egypt, by the action of the same unified world influences which have touched the nations already cited. The great disturbances in the larger nations have obscured the significance of late events under the shadow of the Pyramids. Likewise Persia, which for centuries has been of general interest only for its ancient history, has overnight leaped into the glare of public attention because of its successful fight for constitutional government. How far-flowing are the day's deep spiritual currents that they should thus refresh the parched hearts of the Persian people, and lap the peacock throne of the Shah until it has been undermined and over-

thrown. When we come to understand more fully the meager news from Morocco we shall read it as one more manifestation of the universal power that is making China and India over, that has given religious liberty to Russia, that has aroused the anti-clerical storms of democracy in Spain and Portugal, and that has penetrated even to the nomad Bedouins of the desert.

No man with eyes to see can look upon this marvelously awakened world today—especially if he look closely and deeply—without perceiving that all the clamorous voices of the nations may be interpreted as a call for the truth which sets men free. The world's wants are many, its need is one. In all careful thoughtfulness it must be declared that the underlying, abiding, all-enhancing need of the world is for the Gospel of Jesus Christ, which alone imparts new life, new liberty and new brotherliness. In the last analysis, the Christian missionary crusade is the supreme service of this revived, homogeneous, aspiring world.

SWARTHMORE, PA

Moon-Farming

BY L. H. BAILEY

[Professor Bailey is director of the Agricultural College at Cornell University and the author or editor of dozens of books and encyclopedias on agriculture.—EDITOR.]

THE pork from pigs killed in the old of the moon will shrink when cooked, but it will retain its size if killed in the new of the moon. Animals born when the moon is new or increasing will be much more likely to thrive than those unfortunately born at the opposite period. Fleeces will not be so heavy if sheared when the moon is on the wane. Meat decays with unnatural quickness if exposed to moonlight.

In the new of the moon is the time to set hens, to plant corn and other things that grow above ground. Planted in the old of the moon, seeds of such plants will probably rot. On the other hand, crops that grow under the ground, as potatoes and beets, should be planted

in the old of the moon; and plants that tend to run too much to vine and straw also should be planted at this period. Beans planted when the moon is on the wane will not cling to their poles. Grain purchased in the full of the moon will be of full weight. Rail fences sink into the ground and rot if built in the old of the moon. If shingles are laid in the new of the moon the nails will pull out. Timber lasts longer when cut in the waning of the moon. My fireplace wood is "sappy" because it was cut in the waxing of the moon.

The moon foreshadows the changes in the weather. It chills and mimes plants on clear nights. In the full, it causes wounds to heal. The lunar influence

controls the rise and fall of symptoms in the sick. It governs mental qualities, and all persons who are unsound of mind are to this day lunatics.

Pliny and all the older worthies knew well the occult influences of the heavenly bodies on the affairs of men and also on the welfare of poultry and of pulse. The facts are well attested.

To this day also there are astrologers who foretell events, who prophesy the weather and the crops, and who instruct the farmer by the infallible signs of the zodiac and the course of the heavenly bodies. They print oracular books that set forth all these secrets for any person who would be wise.

The peoples of the world come up thru superstition, divination, magic, conjuration, and mythology. They look to the heavens and the deities for explanation. Moon-farming is a memory of this early order, still persisting, and still controlling the routine of many more persons than we know. Very few persons are emancipated from "signs" that superior beings have set in the order of things for our guidance if only we can find them out. I suppose that most persons yet look for the moon over the right shoulder. It would surprise us if we could know how much the outlook of the people about us is directed by mysteries rather than by reason.

The ancients, observing that the sun and moon and the planets that they knew are all confined in a narrow space in their course through the heavens, set off an arbitrary band encircling the sky; this band or zodiac was divided into a dozen sections, and the stars that came within these sections were conceived to compose constellations, to which were given the names of terrestrial objects which they were imagined to represent; and signs were attached to these constellations, as of Aries the Ram, Gemini the Twins, Aquarius the Water-bearer, and each of these signs was conceived to preside over some part of the human body; and to this day the first page of the almanac represents the man with his vitals unpleasantly exposed but with the signs that control his organs properly indicated. When certain constellations reign, the sign is in the head or in the feet; and the wizards then know what

is to transpire when the crops are planted or the pork is killed.

Now, it matters not whether there is any such band as the zodiac (modernly discovered planets are not within it), or whether there are in fact any such constellations as Scorpio and Pisces and Leo, or that the Babylonian "signs" are only figments of a superstitious imagination—they and the moon, nevertheless, control the order of the world and indicate to a man infallibly when he may plant his beans.

We often speculate what was the outlook of the people who interpreted the world by means of wonders. I am interested in these remaining books and notions as illustrating in some degree in our modern world this type of mind.

Now, I would not deny that the moon exerts influence on animals and vegetation. I do not know that it does not; but this influence, if it exists, is to be determined by investigation rather than by assumption; and it certainly must be uncontrollably small. It is easy enough to account for all the behaviors of animals and men and plants by supposing. Anything can be explained by astrology. The heavenly bodies are always on duty, and may always be invoked to account for anything on the earth. The only difficulty with the explanation is that it may not be true. There are so many things going on in the universe and in the world which forms its pivot, that occurrences are always coming together. There are vast numbers of persons who account for happenings by coincidences rather than by proofs.

It would seem to be a truism that men should now accept and believe the things that can be proved; yet I suspect that most persons are not, in fact, guided by this method, and that most of them really do not want to believe what is true. We are guided by notions, traditions, what we hear, and what it is agreeable to believe.

We may laugh at the man who plants his corn in the moon rather than in the earth, but the scientific spirit—the spirit that would know the fact—does not yet dominate the lives of the mass of men. This is no more true of farmers than of others; in fact, I am inclined to think that it is less true of them, for they are

in constant contact with fact that is original and real.

Most of us assume what truth is, and then make our observations fit our assumption. It requires the integrity of mind exemplified by Darwin to accept facts that contradict our theory. Time and again persons recite to me in detail how their plants behaved because planted in the new of the moon or in the old, and ask me if it is not true. They forget or do not see the exceptions; and they think that I ought to be able to explain all behaviors of crops out of hand, rather than to take the trouble to find out.

Once we explained everything that is not understood by appealing to extra-terrestrial influences. Diseases of human beings were "judgments" for sin and disobedience. Insect pests were excommunicated by the Church. The diseases of plants were due to currents of electricity and other mysterious and celestial agencies; but we have now learned that even these diseases have particular origins and that we determine what these origins are by patient investigation and not by guessing. The man who appeals to the zodiac and the moon merely lives in some previous age. He is not of this generation. He always explains, but he never understands.

To prejudge (which is prejudice), to explain without investigation, to have a theory that always works and is never wrong, to accept what has been, to follow rule-of-thumb, to be uncharitable to any one who would go to the bottom and uncover the facts—these have constituted the slavery of men. It is a common

saying that the scientific men, even when they write for the people, cannot be understood by the people. It is unfortunately true that many men of much science cannot express themselves attractively; but the real difficulty is that the reader may not understand the direct scientific method, and it is impossible to put the argument from fact in such form that the man who believes in the moon can follow it.

Country people at least must interpret nature from cause to effect, rather than by notion or tradition. This they are now beginning to do and this constitutes the new agriculture. Those who cannot interpret nature and who are poor business men are being driven off the land. The colleges of agriculture and the experiment stations are making this great contribution to human welfare—they are instructing the landsman to ascertain the fact and to establish his practice on it. To see an investigator at work studying an insect or a soil is to get touch of a new attitude toward nature. Nothing is taken for granted and everybody's opinion must be tested. Beyond all "practical" application of the work of these institutions, is the new and open-minded attitude that they develop on all problems under discussion. They banish all guessing, all moon-farming, and all think-so. The farmer is now willing to learn and to cast old notions aside; and for this reason the world is becoming a new world to him and he is beginning to undersand his situation. As rapidly as he understands his situation, he will master it.

ITHACA, N. Y.

Autumn Days

BY MARTHA R. McCABE

Autumn days,
Misty haze,
Purple sky a-shining;
Flowers dead,
Sumach red,
Woods and wayside lining.

Garnered wheat,
Bitter-sweet,
Its coral tendrils showing;
Shocks of corn,
Frosty morn,
FRESHENING WINDS A-BLOWING.

EMERITA, KAN.

Panama, A Field for American Enterprise

BY FORBES-LINDSAY

[Mr. Forbes-Lindsay, author of "Panama: The Isthmus and the Canal" and other works on tropical countries, has recently made a tour thru the comparatively unknown Chiriqui region of the Republic of Panama and has been much impressed with its possibilities as a field for American enterprise.—EDITOR.]

THE constantly increasing number of Americans who look to foreign lands for fields of enterprise fall, for the most part, into two categories—gold-seekers and home-seekers. I will not incur the responsibility of advising the former to try their fortune on the Isthmus of Panama for, altho that region may contain rich mineral deposits, as many believe that it does, my inquiries have failed to elicit satisfactory evidence of such a condition. On the other hand, I can confidently assert that to Americans anxious to engage in agriculture, Panama offers splendid opportunities.

Viewing the territory from the latter standpoint, a large proportion of it is excluded from consideration, leaving, however, a section sufficiently rich and extensive to support several millions of inhabitants. Almost the entire stretch upon the Atlantic side of the mountain range which runs thru the Isthmus is covered with heavy timber and dense jungle. Here corporations with large capital could probably engage in lumbering with profit, but the cost of clearing prohibits agriculture and the excessive rainfall is detrimental to most forms of it. Similar restrictions prevail against the Darien country, but it enjoys the advantage of containing more rubber forest than does any other province in the Republic.

There remains the belt of land extending from the Canal Zone to the Costa Rican border, roughly stated, 250 miles in length by 40 miles in breadth. This is the only portion of the interior that contains any considerable population, or in which any degree of development has been attained. In both these respects that section comprising the Districts of David, Bugaba and Alanie is far in advance of other parts of the country and must, by reason of its superior natural advantages and industrial facilities, be

the seat of the earliest and greatest development. With an extensive experience of tropical countries, I declare unhesitatingly that there is nowhere in the world a region richer in natural resources than this. Furthermore, it has the characteristic, extremely rare in the tropics, of a climate devoid of excessive heat. The mean temperature is somewhat below 80 degrees and the extreme fluctuations do not vary from this more than 10 degrees. This applies to the coastal regions; the highlands enjoy cooler and less humid atmosphere. The first four months of the year embrace the dry season. This period is entirely free from the torridity of the tropical summer. Sufficient rain falls to keep the vegetation green and insure fresh food and abundance of water for the live stock. The rainy season extends over eight months of the year. The rainfall takes the form of heavy showers, seldom lasting longer than an hour at one time, or covering in the aggregate more than four or five hours of the twenty-four. It is only at the end of this term that the downfall is great and during August and September Chiriqui is visited by a return of typical summer weather lasting for a month or six weeks. The lay of the land and the nature of the soil create perfect drainage. The water runs off the surface in an incredibly short while after a downpour and nothing like a swamp exists in all the region under consideration.

The land runs up from the ocean to the mountains in such easy gradients that bullock carts of the heaviest and most cumbersome build make the journey from David to Boquete without difficulty. The growth in this section is thick but of such moderate size as to be easily cleared with the machete. Expanses of llano, miles in extent, alternate with the woodland. These gently rolling stretches

THE PATIO OR COURTYARD OF AN UP-COUNTRY HACIENDA

THE HOME OF MR. LITTLE WILSON

An American who has been engaged in raising cattle at Divala for fourteen years

of grassland, dotted with clumps of shade trees, afford ideal range and pasture for cattle and horses. In physical appearance and in the character of the herbage the llanos closely resemble the famous "blue grass" pastures of Kentucky. They are wisely retained as "commons" for the general benefit of the community. Carts may be driven over this land in any direction with as much ease as over a turnpike and the roadway is continued thru the brush without difficulty. The only obstructions to easy travel are found in the streams which cross the country at intervals of every few miles. Those that could not otherwise be passed are spanned by bridges, to which additions are constantly being made.

In describing the fertility of this wonderful country, exaggeration is impossible. The natives nowhere practice cultivation as we understand it. The crudest methods of agriculture produce amazing crops. The ground is cut over and the brush burned where it lies. The surface of the earth is then scratched in spots and seed dropped in. After that the plant is allowed to take care of itself, and it never fails to thrive. Sugar cane has been continuously harvested for fifteen years without replanting, giving a stalk weighing eighteen pounds or more. Tobacco, corn, bananas, and other crops are raised in the same haphazard fashion.

Every tropical plant and many of the fruits and vegetables of temperate climes flourish in this region, with its varying altitudes. The coastal tracts produce the finest cocoa-nuts. The tobacco, with proper care, would be of the highest grade. The output of a cacao plantation owned by an American commands the best prices in the London market. Chiriqui cotton, tho of short fiber, is of excellent quality. Several Americans in the mountain valley of Boquete are growing coffee which sells at the extraordinary figure of fifteen cents gold a pound. Superior rubber is gathered, mostly from wild trees, by three or four corporations operating in different parts of the Isthmus.

For the growth of tropical fruits no better soil and climate than that of Chiriqui in the neighborhood of Costa Rica could be found, but the industry is neg-

lected and large quantities of oranges, grape fruit, bananas, avogados, mangoes, etc., are imported from the West Indies. Several species of commercial fiber are found in a natural state and without doubt maguey, sisal, and other fibrous plants might be cultivated successfully. Conditions are perfect for the growth of alfalfa and a ready market exists for it in Panama. Sarsaparilla, vanilla, tamarind, cashew, and sapodilla are among the many natural products of this region that might be cultivated with profit.

The only agricultural industry pursued by the natives with any considerable degree of success is that of cattle raising and it is not carried on to an extent commensurate with the demands of the home market which will be greatly expanded after the opening of the Canal. Not more than half a dozen persons are engaged in the business, and their herds do not number more than 5,000 in the aggregate. An exceptionally fine breed of animals has been produced by careful selection and experiment. The ordinary price of a four-year-old steer at David, the point of shipment, is \$30 gold. The cost of raising and fattening is very small. Natural growth upon the ranch furnishes all the necessary food and five or six men will look after 1,000 head.

The Pacific side of the Province of Chiriqui has made greater advance in the development of natural resources than any other portion of the country. It contains a number of agricultural centers, such as Boquete, Bugaba, Divala, Buqueron, and Alanje, which are connected with David by good roads. David, the capital and chief port of the Province, is a town of about 4,000 population, with a number of mechanical industries and a considerable export trade. Two lines of steamships maintain a regular connection with Panama and a third is on the point of entering into the service. A railroad from the City of Panama to the capital of Chiriqui is shortly to be constructed. This improvement must stimulate a number of industries and especially that of fruit culture.

The reasons for the long neglect of the natural resources of this marvelously rich country are not far to seek. One of them is lack of capital; another, and a more potent one, was the unsettled condition in which the people have lived for

STREET SCENE IN DAVID.

STRETCH OF LLANO
On the road between David and Alanje. This picture was taken at the height of the dry season

generations past. The territory now possessed by the Republic of Panama has been until the beginning of the present century the seat of frequent revolutions, each one of them involving confiscation and destruction of property. This condition suppress native enterprise and repelled foreign capital. Now, however, the interests of the United States in the country are a guarantee of peace and stability.

I have no hesitation in declaring that no country in the world holds greater promise for corporate enterprise, in a variety of directions, than does the Republic of Panama. The prospects for individual American immigrants must be stated with some qualifications. Any American of good character may go to Panama and secure title to a considerable tract of public land at a cost of five pesos—equal to \$2.50 in United States currency—per hectare, on condition of fencing it and reducing it to cultivation within five years. The cost of clearing will be 20 pesos per hectare, and of general labor, one peso per day. Thus a man with \$1,500 may take up and improve 50 hectares, or about 125 acres, of land, and a very moderate knowledge of farming will suffice to insure good crops. But the question of marketing the produce involves less simple considerations. Very little public land is available along the existing lines of communication. It is not necessary, however, to resort to the settled districts in order to secure good land. The richest in the country is generally believed to be that beyond Divala and Bugaba, the outposts of settlement, and the Costa Rican border. But in this frontier region, otherwise most desirable, two serious diffi-

culties will be encountered by the settler of moderate means—those of transportation and labor. To a company undertaking development in this section the expenditure of, say, \$5,000 in the construction of roads and the importation of laborers would be a small matter, but to the individual, with comparatively little produce to send to market, the expense would be prohibitive. It is safe to predict that in ten or fifteen years time this entire territory will be covered by a network of highways and dotted with villages. In the meanwhile, I would suggest that Americans with small capital settling in Panama should form colonies, which would insure advantages besides that of pooling the expense of roadmaking and securing labor. A still better plan would be to occupy land on, or near, the property of some development company—of which several are projected—and take advantage of its facilities for marketing produce and attracting labor.

Of course, the quick crops, such as sugar cane and tobacco, must be the mainstay of the small farmer. But by putting a portion of his land into an orange grove or a cacao plantation he may in the course of seven or eight years create a valuable property. Almost anything that he may raise will, under the conditions that have been suggested, be salable at a profit. There already exist a number of markets in which the products of Panama, actual and potential, might be disposed of in large quantities. The Canal will bring the ports of Chiriqui into water communication with the entire coast of the United States and with practically every part of the world.

NEW YORK CITY.

The Victory and Death of Wolfe

BY ALFRED AUSTIN

POET LAUREATE

(The news of Wolfe's death reached London on October 17, 1759, and was received with feelings of sorrow and exultation. Mourning was worn by the poorest, and the exploit was regarded with as much astonishment as admiration.)

"SCALE we the Hights," he said, "before
Daylight broadens in slope and shore,
Creeping and crouching, but mounting still,
One by one, up the trackless hill.

"But speak not a word, and make no sound,
As upward you wind, and let none look round.
Comrades will follow the path you make,
Thru scrub and bramble and tangled brake."

Then from boat after boat sprang its living load,
And clomb and clomb up the zigzag road,
Silent as death, until they saw
Rampart, and trench, and cannon's jaw.

Then a shout went upward to rend the wrack,
And the Plains of Abraham shouted back.
Menace to menace, and clang to clang,
Till the Hights with the musket-rattle rang.

But never a man or turned or ran,
For the Chief was there, in the battle-van.
Leading them on, until he fell,
In the onward rush and the mingling yell.

They laid him down on the trampled clay.
"Montcalm, too, has fallen," he heard them say.
"Over us fire the self-same gun;
Victor and vanquished, in death, are one."

"Look! Now they run!" "Who run?" he gasped;
"The enemy, Sir!" His hands he clasped.
And murmured, ere his last breath was spent,
"Praise be to God! I die content."

SWINFIELD OLD MANOR, ASHFORD, KENT, 1859

Long in Darke

BY W. E. BURGHARDT DU BOIS

AUTHOR OF "THE SOULS OF BLACK FOLK," ETC.

THRUOUT the United States there are numbers of communities of black folk, segregated, secluded, more or less autonomous, going their quiet way unknown of most of the surrounding world. Some of these, like Mound Bayou, Miss., and Cass County, Mich., have been exploited in the press; others, like Gouldtown, N. J., and Buxton, Ia., are almost unknown. Particularly are the Ohio negro settlements unheard of, and yet there are in Ohio and Indiana perhaps a dozen such communities, romantic in history and rich in social lessons. Black men as well as white looked toward Ohio for economic freedom in the first days of the nineteenth century. It was wild John Randolph of Roanoke that gave his emancipated slaves the choice of Liberia and Ohio. They chose Ohio, and came in 1846, and last month 150 of their descendants held a reunion.

It was this reunion that sent me searching for my folk in Ohio, and thus almost by accident I ran on Long in Darke County.

Long is a settlement of colored people, a hundred years old, and Darke County is in Southwestern Ohio, 60 miles north of Cincinnati.

The land is dark and level. Great fields of corn stand strong and luxuriant. The tobacco is green and silent, and all about are piled sheaves of yellow wheat and oats. Far out in the distance there are no hills, but only the shadows of oak and beech woods and the dim dying away of level lands. The houses stand

from a hundred to a thousand feet apart. Some are old and built with some shade of the style of Southern mansions. Most of them are newer, representing a renaissance of building in the last decade or two. They show forth different ideas and degrees of living. Here is a cottage with smooth-shaven lawn and flowers; yonder a little, irregular house, with no step, but wandering path and gardens; further on are great barns and a straight, busy house, naked of porch or ornament. There where I stayed is a yellow house, surrounded by a porch with climbing clematis, barns and outhouses, and in front a view of great stretches of green corn and tobacco. Further up the road two churches crouch, looking each other squarely and suspiciously in the face. They are wooden, small and rather bare. Near them is a two-story house, with lodge rooms above and a new grocery store, kept by two pretty girls, below. Three schoolhouses are scattered in the hamlet, and one Quaker seminary, with traditions and history of some sixty years or more. The dusty road which runs down thru the hamlet, stretching its $4\frac{1}{2}$ miles thru Indiana and Ohio, with its hundred families on either side, is not apt to be deserted, and especially on Sunday is it lively with buggies and well-fed horses and the voices of young people riding up and down.

Down the narrow lane at the back of the house where I lived lies a grove of young, straight and golden green trees. Here the annual Sunday school picnic is held, and here, on the Sunday when I

was there, came three hundred buggies with a thousand people. Looking at the people first you would have noted little unusual—they were well fed, well dressed, quiet and white. That is, mostly white—here and there a tinge of gold and olive and brown, and one or two black faces—mostly white, you would have said. Then, when you inquired, you would have learned that most of these people were “black,” for Long was settled by octoroons and quadroons in 1808.

In this grove last year was celebrated the one hundredth anniversary of the founding of Long. There was, it seems, in the eighteenth century a certain Pennsylvania Dutchman who went to Virginia and had a daughter too darkly beautiful to marry under Virginia law. He had for a neighbor, however, a man as moral as he himself, whose son was born of an Indian-negro squaw. This boy walked to Ohio in 1804, squatted on new land in the wilderness, and returned and received the Dutchman’s daughter as his wife. But the Dutchman loved his darker daughter, and straightway leaving his white family, accompanied his colored children to Ohio, where he lived and died on the 782 acres which they bought. Fifty descendants of this couple now live and half of these farm on 400 acres of the original land.

Later others came from North Carolina and Tennessee and the rest of the South. One white planter brought his colored son and ten grandchildren and placed them on 700 acres, and even as late as 1850 came a white Mississippi planter and two black wives, with fifteen sons and daughters and \$3,000 in gold.

Then came a fight for life. The surrounding communities looked with disdain and hatred on these folk whose faces were scarce darker than their own. If a black man came to town he was liable to be chased by hoodlums, and when the whites came out to stop the dedication of a Wesleyan church there was so bloody a battle with fists and

brickbats that the experiment was never tried again.

Internal development followed. The church was built and land bought and cultivated. The settlement became one of the main lines of underground railway service from the Ohio River. The Wesleyan church split in an attempt to exclude tobacco users and members of secret societies, and wild young law-breakers and illegitimate children appeared. Then the War came and slowly the community gripped itself. Its sons and daughters went forth into the world and became doctors and lawyers and one a bishop. Some fifteen of the men at various times took white wives from the surrounding community and traveled away, never to return. Their children today in Chicago and New York are probably “hating niggers.” The women were more loyal, and refusing to intermarry, took hold of the community. For thirty years they have kept liquor selling out of the village, smashing the last kegs themselves. Today the community is quiet, well-to-do and law-abiding. The white Judge of the County Court, who spoke to them while I was there, said, “I have to come to you; you never visit me.” A visiting presiding elder, who has known the place intimately for more than twenty years, knows of but two illegitimate children, and one of those was begotten abroad. The people own 5,000 acres of land worth a half million dollars, excluding improvements, and form a community of five or six hundred people. Fully half of them tomorrow could lose themselves among their white neighbors and never be suspected of black blood. Yet they keep themselves aloof, quiet and loyal, refusing to associate with any one who cannot associate with their friends and relatives. Beneath the placid beauty of their fields run the waters of bitterness, but it cannot spoil their cherished past nor the singular comeliness of their growing boys and beautiful women.

ATLANTA, GA.

A Search for the Hittites

BY B. B. CHARLES

[Professor Charles was one of the party from Cornell University which last summer made during the past year a successful and important exploration in Asia Minor in the line of archaeological research. Editor.]

IT is not a remarkable fact that a nation, having run its course, should decline and die; but it does come to us as a surprise that a people living in historic times, successfully opposing its arms to great world powers, and recording its conquests in war and in the arts of peace on imperishable stone, should be buried with its very records for a winding sheet and be forgotten. Yet this, almost, was the fate of a people that developed a peculiar art and possessed a form of writing and a culture

biography of its varied remains. Scattered over an area of, roughly, 150,000 square miles, extending from the Boghaz Köi region on the north to Hamath on the south, and from Mt. Sipylus to the Euphrates, are found numberless mounds, strong places, rock cuttings, sculptures and inscriptions, all of which belong to this remarkable people. Few of the mounds have been excavated, but even the unopened ones tell their story of Hittite occupancy by the peculiar kinds of pottery and by fragments of

HITTITE BAS-RELIEF; A LION HUNT

From Gudebe-Göran

all its own; a nation which loomed with awe-inspiring largeness on the Assyrian border and forced great Egypt to the humiliation of a treaty on equal terms.

The Hittites, until very recent years, were to the Bible student a name, and to one who did not peruse his Bible less than a name, since outside of this book existed only a few scattered references, Assyrian and Egyptian. Now, however, the short list of records is fast being supplemented, and we begin to read the life of this great people, not yet, indeed, in its inscriptions, which, tho many, are still a sealed book, but in the unfolding auto-

sculpture and inscriptions which make their way to the surface; castles and walled cities point out some of the important routes and speak of a people trained in the art of making war; and every bit of the handiwork of a Hittite adds its word to the story of the people. Indeed, the science of Khetology has all but been born. It needs but a touch of the spark of genius to open up a literature which, already great, will soon be a vast library of written records from the hands of the Hittites themselves. For we have not only a considerable number of inscriptions in the peculiar hiero-

glyphic of this people, but also a collection, large even today, of clay tablets like those of Assyria written in cuneiform Hittite. In these will be found the golden key for the opening of the language; for it has been admirably demonstrated by Professor Sayce that, given a considerable literature in an unknown tongue but written in the wedge-shaped character and the decipherment of that language is possible.

Whether an enemy ever made its way into the Hittite empire until it stood before the capital, "the city of Hatti," is unknown. If such was the case, the foe found themselves confronted by a city built up the fairly sharp northern slope of a rocky hill, the southern side of which drops off in discomfiting abruptness, while the other two sides have natural protection in ravines, that to the east being deep and narrow and giving to the humble modern representative of the ancient city its name, Boghaz Köi ("Ra-

vine Village"). The two summer campaigns of Prof. Hugo Winckler in this place have revealed much of interest. The hill was strongly fortified by great walls, with a system of hidden passages, reminding one of the walls of Tiryns, and by several fortalices built on commanding rocks within the city enclosure. In the lower part of the town stood the great palace, and in the upper part three sumptuous edifices, temples or palaces. The massive foundations of all remain; but the upper work, built, as it was, of clay, has disappeared. Dr. Olmstead has noted various points of similarity between Hittite and Cretan architecture; the clay walls laid on solid stone foundations; the dowel holes drilled in the upper foundation course, in which poles for strengthening the clay work were inserted; the long, narrow store chambers, filled with huge jars, connected with the palaces; and the frequent use of gypsum for facing rough masonry.

HITTITE RELIEF
In the courtyard of Government House, Malatia

Following the present custom in the Anti-Taurus section, where the great majority of the inscriptions are found, much of the building in Hittite times seems to have been of wood. Kül Tepe ("Ash Mound"), which contains the remains of the later Hittite capital, Mazaca, is a veritable mass of ashes, such as could have been produced only by some great conflagration in a city built mainly of wood. Layers of ashes are found also at Boghaz Köi and other sites, and the absence of any remains near certain of the monuments where we should expect buildings, or at least foundations, leads to the conclusion that much of their work was in a material whose decay leaves few traces. This fact may explain the comparatively low height of many mounds long occupied and the absence of mounds representing the hundreds of hamlets which must have existed.

The most important result at Boghaz Köi was the unearthing of the mass of clay tablets mentioned above. Many of these are written in Babylonian, that *lingua franca* which penetrated to all parts where Babylonian influence was felt. These naturally can be read without much difficulty, and in them is revealed a second Amarna correspondence, letters to and from all the great powers of the day, one having the peculiar interest of being a cuneiform duplicate of the famous treaty between the Hittites and Egypt. The majority, however, are in cuneiform Hittite, and form, together with those of the same character found previously in various parts of Cappadocia, and the tablets in this tongue found in the Amarna collection, a fair-sized library.

Aside from the work at this site, very little excavating has been done. To reach the region where this has been carried on we must leave the home center of the Hittites in Anatolia, and traveling southward as did they themselves in the expansion of their empire, cross what would have proved a barrier to a weaker nation, the great Taurus range. Two series of excavations have been carried on here: one at Zinjirli in a fertile plain separated from the Gulf of Issus by the Amanus Mountains; and

the other at Sakche Göz, in the mountains a few hours to the north. The one place was excavated by von Latalan a number of years ago, and the interesting architectural, sculptural and epigraphical results of his work are well known. Operations at the mounds of Sakche Göz were begun last summer by Professor Garstang, and the interesting sculptures and buildings laid bare in his short campaign give promise of most important finds.

In each region—the northern or Anatolian, and the southern or Syro-Mesopotamian—we may distinguish three general periods in the development of the Hittite hieroglyphic, attended in general by changes in the art as well. The first period in the north goes back to a time, perhaps 1500 B. C. or earlier, when, tho most of the symbols have already come into being, no word divider is used; when the employment of two strokes under certain symbols and at times a single stroke attached to other signs (devices, apparently, to alter the value of these characters) has not been adopted; and when the symbols, always cut in relief, represent quite faithfully the objects from which they have been derived. The second period would then represent a time, perhaps the thirteenth century and later, when the symbols, still in relief, were more artistically cut; when some of them begin to be slightly conventionalized; and when the word divider as well as the double and single strokes are in general use. The third period, beginning possibly as early as 800 B. C., brings in a more cursive style, characters much more conventional, especially on many of the seals, writing generally incised, and an increasing neglect of the earlier rule of boustrophedon arrangement of the lines.

The first period in the southern region corresponds with the second of the northern, and the second of this Syro-Mesopotamian country with the last of the Anatolian. Then comes a period marked more in the sculptural treatment than in the writing, in which the Hittite art is strongly influenced by that of the Assyrians. Examples of this are to be found in the reliefs from Sargonide Zinjirli and Sakche Göz. In these we

THE HITTITE GOD TESHUB-ADAD.
Excavated at Babylon by Dr. Robert Koldewey, of
the Deutscher Orientgesellschaft.

find the familiar Hittite figures taking on new forms and different groupings, and a general archaic stiffness, at home in Assyria, pervades the work. Many of the inscriptions of this period are in relief. This may possibly represent an archaistic tendency, but gives the impression of a further direct development of the first Syro-Mesopotamian period rather than a reversion to an older form.

So much, then, as to the exploration of mounds. That much still remains to be done even on the surface is shown by the experience of the Cornell expedition, organized by Professor Sterrett and consisting of Dr. A. T. Olmstead, J. E. Wrench and the writer of this article. The party had intended to make a rather hasty journey thru Asia Minor on the way to their main work in the less well-known countries further east and south-east. They found, however, that existing copies of most of the known Hittite inscriptions still in the field left much to be desired in the matter of accuracy and completeness; and this, together with the crying need of topographical and other studies in the lands of this remarkable people, converted them for a time into a Hittite expedition.

Nineteen inscriptions, still in the place of their discovery, had been published in the "*Corpus Inscriptionum Hittitarum*" at the time the party left for the field. All of these were visited, and in the case of most of them substantial additions and corrections were made, the number of characters thus added being in several cases nearly a half of the whole inscription. This means much in the study of the language, for it is only by the use of correct copies that we shall ultimately be able to read the Hittite hieroglyphic.

In the heart of the "City of Hatti," the capital of the empire, cut on a low, sloping cliff, stands a hieroglyphic inscription, the greatest that has come down to us, being about ten feet high and twenty-eight feet long. Written, as it is, in the earliest form of Hittite, it has doubtless stood a silent spectator of the centuries of that people's greatness and of its decline and fall; and its message, when read, will be an echo of the time of the nation's greatest glory. This inscription has been known for years, yet time has dealt so hardly with the face of the rock that travelers have considered the task of copying the writing altogether hopeless. Touched, however, by the rays of a descending summer sun, many of the weathered and worn symbols stand out clearly, and one takes heart as he goes about the work of making paper impressions, photographs and copy. The Cornell party spent two days and a half

working at the face of the cliff; and later, at the end of the journey, the present writer, returning, twice more revised the already corrected copy, so that now about a half of an inscription hitherto considered illegible has been recovered.

This expedition was especially fortunate in finding new inscriptions and sculptures. Most interesting of these are the reliefs discovered at Isbekjür, an ancient site on one of the important routes between Cæsarea and Melitene. They are cut on blocks of basalt which, now hollowed out, are used for mortars in which to pound up the yearly supply of cracked wheat. The blocks are four in number, some with inscriptions and sculptured lines, others with only the sculpture in low relief; and they seem to have formed originally a monolithic prism about a foot and a half square and perhaps seven or eight feet high. One side is blank, and apparently stood against a wall. The face contains, besides its inscription, the figure of a bull well worked out in the hard basalt, a splendid example of Hittite art and reminding one strikingly of one of the charging bulls on the well-known Mycenæan cup from Vaphio. On this animal stands a Hittite priest pouring a libation. The other two sides contain each a figure, human or divine, the one standing on a sort of wall, the other on conventionalized mountains. Both are represented as drinking from cups.

Among other discoveries was a great lion in high relief with incised inscription, which the party dug from Arslan Tepe, the mound which marks the site of Meliddu-Melitene; and a second interesting relief with inscription now in the courtyard of the government house in the modern city, Malatia.

Results fully as interesting were secured in connection with the architecture, history and topography of the Hittites; but most of these are only this summer being worked into shape for publication. A few points may, however, be noted.

A unique work was the pottery survey, that is a close study of the potsherds yielded by about a hundred Hittite sites. Already, as a result of this, the different periods of Asianic pottery have been determined and an invaluable means of dating sites has been discovered.

BAS RELIEF WITH HITTITE INSCRIPTION
From Isbekas, on the Euphrates.

By a close study, on the spot, of the pre-classical topography as found in the Assyrian inscriptions and in the classical writers, the party has been able to change very considerably the map. Lines of many Hittite roads have for the first time

been laid down and many identifications of early sites established. As an example may be taken the work in connection with the city of Iconium. Konia, the modern representative of this place, is searched in vain for traces of early occupation. Only Seljuk remains, and late forms of pottery meet the eye, while the mound, which one expects to find covering the ruins of the ancient city, nowhere appears. Clearly we must turn elsewhere. About an hour south-southwest of the modern city lies a great deserted mound covering an area of thirty-two acres, one of the largest in all Anatolia. Here were found potsherds ranging from

Phrygian to the earliest Trojan types. The conclusion is obvious: a very early site, a huge mound within the required limits, and the fact that no other great mound appears in the region make it a certainty that the interesting pre-classical city of Iconium has been discovered.

This, then, is a short summary of the present status of the Hittite question. The outlook is exceedingly bright for this nation so long hidden from the world; and we may soon expect the day when our old friend of the Canaanite-Hittite-Hivite-Perizzite series will assume its rightful position as one of the family of nations.

ITHACA, N. Y.

In a New England Graveyard

BY GRACE SHOUP

In the still graveyard, with its quiet dead,
I lean above the stone of crumbling slate
And puzzle out the letters. Here 'tis said
Under the clumsy death's head and the date,
"I, Thomas Slocum, lay my body here
To rest until the final judgment day,
When I shall rise again and without fear
Put on the flesh that I have laid away.
How gladly will these long-dead limbs arise
At that most awful summons from the skies!"

How old the doctrine, yet how strange the
thought!

The intervening cons fade from sight;
To old, old Egypt is my fancy brought;
I see them hide dead Cheops from the light.
The vastest structure underneath the dome
Was scarce sufficient to allay his fears;
His body must be saved. 'Twas his soul's
home,
It must not crumble with the crumbling
years.

Body, soul, God, the Ka, the immortal spark,
But checkers for the mind to sort and range
Upon life's changeless board of light and dark,
But counters for the thought to move and
change!

Do you see how the game is played,
This banter of glow and of shade,
Thru the flickering laughter and tears
Of the millions of hurrying years?
Mystic, materialistic, rigid ascetic
Each to the other's thought apathetic,—
"The body is all." "It is nought;
'Tis but the reflection of thought."—
"God made it." "There is no God;
Man's but a developed clod,
Rising from formless stage
To a vertebrate, age after age."—
"The flesh is the lure of the Devil."
"The body is good, not evil."

So struggle theologians, fight the schools,,
Playing the game by all the ancient rules.
Does the mind of each century but repeat
The hope that some other age found sweet,
And whisper still in its muttered prayer,
The same monotony of despair?

By this old stone, made of crumbling slate,
With leering death's head and an ancient date,
I stand and muse, but cannot feign despair,
In this brave daylight and this golden air.
I care not thru what mazes man has trod
I know he stumbles toward the feet of God.

INDIANAPOLIS, IND.

Between Yesterday and Tomorrow

BY ISABEL C. BARROWS

[Last spring Mrs. Barrows went to Russia to see what could be done to save the Russian patriot, Madame Broshkovsky, liberated from jail. She was called back in the midst of her mission of mercy by the illness of her husband, but she has been here alive. Regarding her grief as less to be considered than the sufferings of women who had been victims of cruel oppression, she returned to Russia to complete her service. She sends us the following sad report of what she has seen.—EDITOR.]

OPPPOSITE my hotel window the noble old Cathedral of St. Isaac stands, silent in the great stone-paved square. Later the myriad bells of all sizes that hang in the lofty towers will jangle right merrily, rung by the hands and feet of the skilled musician. But just now they hang dumb and the cathedral sleeps in the heart of the "white night." The days have begun to shorten and tho it is only a little past midnight the fingers of the rosy dawn are beginning to play on the eastern façade of the church while the hardly faded sunset colors still light up the western front. The Cathedral, nay the whole land, stands between yesterday and tomorrow, and by more than one omen it is this very element which the church represents that breaks the coming of the moral dawn, tho the fading sunset would gladly make way for a brighter day.

Night after night as I have watched one day melt into another in this high latitude I have felt that Russia herself, like the year, is hurrying into "the black night," when the shadows will gather at sunset and the dawn will be far away. The world outside speaks of peace having been secured at last in that disturbed land. It is a repetition of the old word: Peace, peace, when there is no peace. True, many of the patriots who were working for the reform of the land they love with the patriot's ardent devotion are scattered and gone. I have been proud to sit with some of them in London, in Paris and elsewhere, noble men, bearing exile and poverty with high courage and hope, believing in a great future for their great land. Others are in Siberia. Many have fallen by the hands of the executioner, guilty only of daring to think for themselves and to act according to their conscience. A still greater number are behind bolts and bars in the terrible prisons of Russia. It cannot be denied that the newest and best

Russian prisons have some things which we might copy to our advantage, such as yards for outdoor exercise for every prisoner, and an hour for sleep at mid-day, but no prison system in the world can be good which has provision for 108,000 prisoners only and into those places crowded 180,000, as Russia is doing to-day, with typhus fever breeding with frightful rapidity thruout the land.

Into these prisons are cast all political offenders whose lives are not taken by the autocratic governors of the different provinces where they are arrested. Formerly the "politicals" were kept by themselves and allowed better diet and to receive extra food from their friends and relatives. *Nor were they flogged.*

How is it today, in this land which lies between yesterday and tomorrow? Of the members of the Second Duma no fewer than 237, elected by the will of the people, chosen because of their worth, their ability, their devotion to the good of the country, have been condemned to prison and eighteen have been sent into exile in Siberia, and many are still in prison and several are dead. As for editors, 400 have been sent to prison. And only last week fifteen political prisoners in one prison received each *one hundred blows!*

Of the 400 prisoners in the horrible Schlüsselburg Prison, on Lake Ladoga, more than a third are politicals. They are compelled to associate with the worst criminals and are treated exactly as tho they had been guilty of the lowest crimes. A few devoted men and women raise small sums of money to improve the diet of these politicals, for the food is not only insufficient, but execrable, but recent regulations forbid any political prisoner receiving any "favor." Whatever is done for one must be done for all. "They have claimed equality: let them have it!" cry the keepers of the prisons. So, whereas a while ago this aid society could collect

and send two pounds of sugar, a quarter of a pound of tea and two postage stamps to each political prisoner per month, now there must be collected four hundred, so that every murderer and burglar may fare as well as the imprisoned member of the Duma! Of course no one believes for a moment that the murderers and burglars get their share.

To go from general to specific cases, for one fact is worth a thousand suppositions. There is today a man in a Russian prison who is typical of scores and hundreds of similar instances. This man, cultured, gentle, refined, was for many years connected with the school system of the country, beloved and respected by all who knew him. He was elected to the Second Duma. He was not a revolutionist, still he believed in a constitutional government, and while exercising his duties as a member of the Russian Parliament he cast his vote in accordance with his conscience, as any honorable man would have done.

On the dissolution of the Duma he was arrested, held in prison a long time for trial, tried, and condemned for that one act to six years of hard labor in prison, and for the first eighteen months *to wear chains!* He is wearing those chains today and must wear them till October next!

That is not all. Indeed it is not the worst to a gentle and refined scholar. We think with horror of solitary confinement, but in Russia it is a luxury. This cultured gentleman is kept in a comparatively small cell with twenty-five bunks in it, no sanitary contrivances and absolutely no privacy. His associates are men of the vilest character, all, except a few fellow politicals, men sent to prison for murder, burglary, arson, incest, the most brutal and revolting crimes. An hour with such people would be an agony to you or me. Think of six years of it! Think of tens of thousands of high-minded, broad-spirited men having to submit to it!

Even that is not all. To punish these offenders still more severely the gibbet is erected opposite their prison cell, and within a few months fifteen men have been hung directly in front of the little window which gives them all their light. And these men were not all political

prisoners, who would have gone with courage to their doom, but cowards and poltroons who are flogged to make them approach the gallows and whose frightful shrieks of pain and fear haunt me here in sight of St. Isaacs, tho I have never heard them save thru the ears of one of the men who must suffer this moral outrage.

This one case I told in detail to a young Russian whom I met in traveling. He shuddered as he listened. "Like you," said I relentlessly, "he is an educated gentleman. Can you imagine yourself in that situation?" Again he shuddered. Mercilessly I went on: "He had to give up wife and little children—six cruel years out of their life, for daring to vote for what he believed to be for the good of the land he loved. You, too, would have to give up your wife and the two little ones that bless your home, and sit with murderers and outcasts instead of with them." He covered his face with his hand and writhed, but uttered no word. In speaking of the overcrowding of the prisons, which he deplored, I said to him: "If they would release all the politicals there would be room enough."

"But wouldn't that be rather dangerous?" he asked.

"It would be dangerous in our land to lock them up, and Russia will sooner or later find that true."

We met as strangers at nine in the morning. At midnight we parted after traveling in the same compartment all day. At parting he asked if he might give me his card. I thanked him and took it, but the car was too dark to read the delicate engraving. The next morning, to my joy, I found that all day I had been giving sore and cruel facts to a member of the official household of the Czar of all the Russias! He at least knows how such facts strike an American woman.

The "yesterday" of Russia was full of woe. She lies in the brief space before the coming morrow. But as the earth and humanity gather strength for the new day in the quiet hours of sleep and rest, so Russia, held down by brutal force for a little while, is but holding her breath for a greater contest for the right when it shall really be "Tomorrow."

ST. PETERSBURG, RUSSIA.

Days of Trial for British Free Trade

BY FREDERIC AUSTIN OGG

VIEWING the tariff situation throughout the world as a whole, two facts stand out with considerable prominence. The first is that the people of the United States are far from alone in their present day interest in tariff problems and tariff revision. The French Chamber of Deputies is struggling with a vast project of tariff legislation; Japan is conducting a searching inquiry into fiscal and industrial conditions preparatory to a sweeping revision of her tariff system; in Germany the crisis on taxation questions, which recently came so near disrupting the whole political equilibrium, forced to the front inevitably the deep-seated conflict of agrarian and industrial interests relative to the adjustment of import duties; in Great Britain the present Parliamentary session has been marked by keener debates and more clear-cut expressions of opinion regarding tariff policies than have been heard in a decade; only a few months ago a new customs tariff went into effect in Denmark, and the same is true of Mexico. Tariff reform, in one or another meaning of that tricky phrase, is distinctly a live issue.

The second fact is that the trend toward universal protectionism, which has been so strongly in evidence for upwards of a generation, continues unabated. At one time—notably in the sixties and early seventies of the past century—it did appear that the philosophy of Cobden and Bright was destined to conquer the world. Europe became for the time being quite predominantly anti-protectionist. But, for a variety of reasons, there came a great wave of reaction, and on the continent to-day everything is protectionist or tending rapidly to become so. Germany went over largely to the protectionist system in her tariff of 1879, and in subsequent acts, notably those of 1885 and 1902, committed herself to it almost without reservation. After a decade and a half of experimentation with free trade, France returned in the eighties to the protective policy, adopting it

unqualifiedly in the act of 1892; and the French tariff now pending provides for the adoption of protectionism in a still more stringent form. Austria-Hungary, also, after a brief period of free trade, became definitely protectionist in the eighties, and the same was true of Italy. Spain has been strongly protectionist since 1877. Russia has never been anything other than protectionist often extravagantly so, for a hundred years. Among the minor states, Norway, Sweden, and Denmark are mildly protectionist, and even Holland, Belgium and Switzerland—the most persistent exponents of free trade on the continent—have been obliged in recent years to give way at numerous points and are to-day wavering on the brink of protectionism. The unanimity with which the representatives of a score of European nations gathered at the International Free Trade Congress, held at Westminster last August, reported the prospects of free trade in the various countries from which they came to be indifferent or positively discouraging, emphasized in unmistakable fashion the protectionist trend of the world's present tariff policies. And altho the tariff soon to be enacted in our own country will provide for a readjustment, and in not a few respects, doubtless an amelioration, of schedules, everybody understands that protectionism as a principle is not with us in the slightest danger and that the United States has very small prospect, indeed, of becoming in the near future a free trade nation.

There is, indeed, just one power of importance that is to-day endeavoring with much earnestness to keep alive the free trade principle which forty or fifty years ago seemed to have so firmly a grip upon the civilized world. That power is, of course, Great Britain, and small wonder is it that last summer's Westminster Congress, in something of desperation, called upon the British to stand adamant in their fiscal policy and ensure to the world at least one convincing proof of the es-

sential righteousness, and even the practical expediency, of the non-restrictive commercial system. . None the less, free trade, even in Britain, is but a somewhat long drawn out experiment, and the question has lately come to be a very insistent one in some quarters as to whether eventually the experiment will not have to be pronounced a failure. Can Great Britain withstand the pressure put upon her by her competitors and maintain herself indefinitely as the single free trade power of the western world, or will she be obliged to give up the attempt and fall in line with Germany, France, Russia, and the United States—and with her own imperial dominions of Canada and Australia?

The conditions which seem to many observers to be forcing the British inevitably to an abandonment of the free trade policy are three-fold—fiscal, social, and commercial. In the first place, the rapidly growing burden of public expenditure and the inadequacy of the revenues at present available suggest that a general tariff for revenue may become necessary, involving protectionist features more or less pronounced, and in any case a radical departure from the British tariff policy of the past half-century. The state of the British budget is confessedly embarrassing, and none the less so because a similar condition is pressing hard upon France and Germany and the United States. During the fiscal year ending March 31st the exchequer ran far behind, and it is estimated that to meet the demands imposed by old age pensions, the increase of the civil service, the relief of unemployment, and, most of all, the upbuilding of the navy, an aggregate of at least £20,000,000 annually in excess of the expenditure of the past year will hereafter be required. Various projects of ways and means have been suggested, but none have met with widespread approval or give promise of really substantial relief. It was in view of this situation that Lord Cromer declared, bluntly but quite to the point, the other day that "what Mr. Lloyd George has to show is how he can meet the very heavy liabilities he has incurred and yet preserve intact the system of free trade."

The second circumstance which is

threatening to-day to undermine British free trade is the continued industrial depression which has been felt, it is true, in some degree in all parts of the civilized world, but nowhere so keenly as in England. Symptoms of industrial disorder are there to be encountered on every hand. One is the rising volume of emigration to the United States and to other parts of the world—an outflow which is proceeding to-day at least twelve times as rapidly, in proportion to population, as in Germany. Another is the astounding proportions attained during the past twelvemonth by unemployment. A third is the prevalence of strikes, labor disputes, and generally unsettled labor conditions. What are the causes of this disturbance in British prosperity? Is it to be temporary or permanent? These are things that the Englishman to-day is trying his best to make out. Without a doubt the causes are varied and complicated enough. But the immediate question is, what will revive home industries and ensure profitable employment to all who stand in need of it? The nations in chorus proclaim a protective tariff to be a panacea for all such ills, and whatever one may think of the prescription, it would not be so strange if the Britisher were to to be influenced eventually to give it a trial.

Closely allied is the argument from commercial depression. During the past year British foreign trade fell off from that of the year before by \$493,868,509. This astounding record is but the culmination of generally unsatisfactory conditions that have been developing for a decade, the most talked of feature of which is the capturing of colonial markets, and even in a large degree of the home markets, of the English by foreign competitors, especially the Germans and the Americans. To the free trade argument that has long been current in England that tariffs augment the cost of living, which necessitates higher wages, increasing the cost of production, which in turn renders profitable exportation impossible, the protectionist retorts that after two generations of experience England finds that the most highly protected nations are not merely usurping neutral markets, but are capturing the markets of the British manufacturers at their

very doors, underselling their free trade competitor, undermining her industries, and leaving in their wake a whole train of economic disaster. The argument may involve fallacy. Your free trader will stoutly insist that it does. But the practical man is bound to feel that he is confronted by a condition, not a theory, and he will be likely to conclude in the long run that if a protectionist policy can promise to England renewed commercial preponderance it is the thing for the country, regardless of theories and precedents.

From all of these and other considerations, it has come about that free trade is to-day being made the object of a most desperate assault in the one important stronghold remaining to it. The onslaught first assumed formidable character some six years ago. It was on the 6th of October, 1903, that Mr. Joseph Chamberlain, lately freed from the cares of state by his resignation from the Colonial Office, opened in a speech at Glasgow the great campaign for "tariff reform" with which his name is still most prominently associated. The Chamberlain programme, as then announced, comprised the remission of three-fourths of the existing duty on tea and a half of that on sugar, coffee, and cocoa, but, on the other hand, the imposition of a duty of two shillings per quarter upon importations of foreign corn and flour, of five per cent. *ad valorem* upon foreign meats and dairy produce, and of an average of ten per cent. upon manufactured goods, to be applied as against foreign nations enforcing high duties upon British manufactures. It was also proposed that the British colonies be given a preference by exempting them from the operation of these taxes. Although Mr. Chamberlain has taken pains repeatedly to deny that he is a protectionist, at least in the ordinary sense, it is perfectly obvious that the adoption of the measures for which he stands would be equivalent to an abdication from the free trade position which Great Britain has maintained for half a century, and would involve nothing less than a mild economic revolution. It is not surprising, therefore, that the proposals have stirred up widespread discussion and that in the years since they were brought forward England has been

fairly flooded with books and pamphlets, not to mention new paper and magazine articles, upon one side or the other of the fiscal question.

From the outset, Mr. Chamberlain proposed that the crusade should involve the element of popular education, and that from a serious and prolonged inquiry into the industrial and commercial state of the realm the expediency of a more aggressive tariff policy should be demonstrated to economist, manufacturer, trader, and wage-earner alike. There was, therefore, created, in 1904, a special Tariff Commission of fifty-two members, to undertake such an inquiry, and particularly to arrive at conclusions regarding desirable modifications in the Chamberlain programme. This commission under the chairmanship of Sir Robert Herbert, has lately entered upon the sixth year of its labors. Since it began its work some 15,000 firms and associations in every part of the United Kingdom have filled forms and submitted written statements on the manufacturing industries of the realm, oral testimony has been taken from more than 400 representatives of the principal trades, and a subcommittee of twenty-three members on agriculture has heard 147 witnesses and received statements from 2,103 practical farmers and agricultural organizations. The Commission issues two series of publications—one consisting of "memoranda" on the commerce and tariff policies of foreign nations, the other comprising special reports, of which about a dozen have thus far been issued, dealing with as many leading industries. Within another year these preliminary publications will be complete and there will be forthcoming the general report of the Commission, a document which will be awaited with interest in all parts of the world. It is hardly to be doubted that it will take advanced ground in favor of Mr. Chamberlain's protectionist proposals and that it will become the favored weapon of the Tariff Reform League, the Liberal Union Club, and the whole corps of protectionist propagandists.

Meanwhile, on the floor of the Commons, the question of fiscal reform, embracing at least some elements of protectionism, has been made during the past few weeks the subject of one of the most

notable debates in a decade. The tariff phase of the debate was precipitated by an amendment introduced in February by Mr. Austen Chamberlain, expressing regret at the absence in the King's speech from the throne of any recommendation looking toward the imposition of a tariff. The amendment demanded unequivocally "a reform of our fiscal system which would promote the growth and stability of our home trade, provide means for negotiating for the mitigation of foreign tariffs, and develop our oversea trade thru the establishment of a system of mutual preference between the different portions of the Empire." The amendment was rejected by a vote of 276 to 107, but the debate upon it marked a distinct advance on the part of the opposition, in that the various elements that comprise it were led to commit themselves more frankly than ever before to a general tariff policy. Mr. Chamberlain declared that protection is an essential

preliminary of permanent progress. Mr. Balfour, the real leader of the Opposition, argued that unemployment in England to-day is at least partially to be accounted for by the Government's free trade policy. The amendment received the support of several members who have been regarded as doubtful, or even as opposed to the protective idea, and, taken along with the decisive gains made in the recent Scottish elections by the Unionists upon a half-veiled tariff issue, the "reformers" have to-day not a little reason for admitting themselves to be in very good spirits.

To the neutral observer, Great Britain appears to be yet very far from won over to protectionism. But it is equally clear that these are days in which the free trade system, in its traditional stronghold, is being subjected to a strain which, if indefinitely continued, can hardly be permanently withstood.

CAMBRIDGE, MASS.

A Woman Knows

BY COLETTA RYAN

A woman knows,

Ah dear, a woman knows,

Why, building 'neath the sun, the bird doth sing

And gazing thru the trees in early spring.

Love harkens, while afar the joy-bells ring,

A woman knows—

Ah dear, a woman knows!

A woman hears the lonely roses' sigh
That drifts across the woodland. Tenderly
She breathes upon each petal. She doth see
The graceful willow dreaming trustfully—
And softly in the shadow she doth hear
Love's song ascending. Why the maiden's
tear

Disturbs and thrills the heart of reason. Who
Hath eyes to count the jewels in the dew—
Who knows the course of heaven, the soul's
despair,

The echo of Love's silence down the air—
The lofty loving that is almost prayer—

A woman knows,

Ah dear, a woman knows!

A woman knows,

Ah dear, a woman knows—

The silhouette of Eden she doth pass—
The sweet direction of the meadow grass—
The heavenly rainbow circling o'er her home,
The doves upon her path. The shining dome
Of sunlit tree that crowns Love's glorious
hight—

The memory of a word that turns to light—
Suspense in dreary seasons of unrest,
Old wounds that ache and throb within the
breast—

Ay, all the moments Love hath bruised and
blest,

A woman knows—

'Tween smiles and tears she knows.

BOSTON, MASS.

Literature

Reading Plays

ALL of a sudden, tho very tardily, the American people have taken to the reading of plays, and it is becoming common to publish them in book form simultaneously with their stage production, as has always been the custom in France and Germany. This is certainly to the advantage of the dramatic author, for it gives him a wider public and a surer footing. It may indicate, too, a change of taste in the reading public, a development of the visualizing power, for to read a play demands more imagination than to read a novel, nearly as much as reading music. The reader must supply his own picture of the characters and their surroundings from the brief, dry details given in the stage directions. He has no one to interpret for him their actions and analyze their thoughts and motives. He must create his own atmosphere and illusion and mood or go without it and get nothing but a barren dialog.

Since a dialog is designed to be spoken, and spoken by more than one person, plays are best read aloud and by a group of several readers taking the different parts. In this way a better appreciation of the meaning and significance of a drama can sometimes be obtained than by seeing it, just as a pianist may learn more by playing a piece of music, however imperfectly, than by merely listening to it. Many literary circles, especially in communities where plays worth while are rarely seen, have taken up the modern drama and adopted this custom of "reading around."

The real reason why our modern dramatists are beginning to be heard beyond the limits of the theater is because they have something to say. The drama is becoming a force in modern life and thought. It is becoming political, as it was in the days of Shakespeare. It is becoming religious, as in the days of the moralities. Last winter one of the most powerful of political forces was a play,

and not a great play at that. Yet *An Englishman's Home* had much to do with forcing the British Government to change its declared policy and build four new Dreadnoughts as a defense against a suppositious invasion of England by Germany. Right or wrong, it was a "tract for the times" and sent thousands of volunteers to the recruiting offices of the new territorial militia. For us Major du Maurier's drama has less interest. We are further removed from the threatened seat of war and we are less addicted to such enervating pastimes as limericks and diabolos.

But the war described in another popular English play unfortunately concerns us as much as the people across the water. Galsworthy's *Strife*² gives a realistic picture of a crisis in the struggle between labor and capital. The characters are painted neither roseate nor black; just genuine. At the head of the opposing forces are the old manufacturer who has never been beaten and is determined to manage his business in his own way, and the indomitable and heroic labor leader, both men of similar character, equally sincere and unyielding. In the end both men are sold out by their subordinates, the directors and the unionists, who with the aid of a tricky lawyer come to a compromise behind their backs, obviously the only thing to be done under the circumstances, but nevertheless a tragedy. Bound with this play are two others, *The Silver Box*, exposing the inequality of administration of justice toward rich and poor, and *Joy*, a pleasant comedy.

*The Helling Pot*³ written by an English Hebrew, is altogether American more American than the Americans, for even on the Fourth of July we hardly dare be so unqualifiedly optimistic over the future of the country so wildly

¹As *Englishman's Home*. Boston: The Macmillan Co. 1914.
²*Strife*. New York: Dutton & Co. 1914.
³*The Helling Pot*. New York: The Macmillan Co. 1914.
⁴*The Silver Box*. New York: The Macmillan Co. 1914.
⁵*Joy*. New York: The Macmillan Co. 1914.

enthusiastic about the success of our great experiment of amalgamation, as Mr. Zangwill is. But it will do us good in this case to see ourselves as others see us, to learn how the fair Goddess of Liberty looks to those who have fled to her protection from Russian pogroms. In the closing scene David, a young Jewish musician, who had narrowly escaped the massacre at Kishineff, is united to Vera, the daughter of the Russian official who slaughtered his parents, and as he looks down on New York City from the roof of an East Side settlement house this is what he sees:

"There she lies, the great Melting Pot—listen! Can't you hear the roaring and the bubbling? There gapes her mouth—the harbor where a thousand mammoth feeders come from the ends of the world to pour in their human freight. Ah, what a stirring and a seething! Celt and Latin, Slav and Teuton, Greek and Syrian, black and yellow, Jew and Gentile, East and West, and North and South, the palm and the pine, the pole and the equator, the crescent and the cross—how the great Alchemist melts and fuses them with his purging flame! Here shall they all unite to build the Republic of Man and the Kingdom of God. Ah, Vera, what is the glory of Rome and Jerusalem where all nations and races come to worship and look back, compared with the glory of America where all races and nations come to labor and look forward!"

The American play that we have in this group, *The Great Divide*,⁴ is not inferior to the foreign, but differs from the preceding in not having a political or social motive. Mr. Moody aims to teach no lesson unless it be that of the triumph of nature over convention, of reality over artificiality. The scenes are divided between the Arizona desert and a New England town, with characters corresponding to these environments. It proved to be one of the most successful and effective plays of recent years on the stage, and it does not lose its emotional power in the printing.

In *Roses*⁵ are gathered four of the one-act plays now so popular in Berlin, not unworthy of the author of "Magda" and "Sodom's End," but not of much importance. To adopt Shaw's convenient classification, one of them, "The Far-Away Princess," is a "pleasant" play,

and the other three distinctly "unpleasant," of the kind that we used to call Frenchy, but nowadays must be called Germanish.

The Catholic Revival in England

FROM his dedicatory note to the last page of his history, Mr. Bernard Ward's two volumes* are full of interest to every student of English political and religious history. The work was very evidently one that awaited doing, and one that could only be done by a Roman Catholic who occupied a position giving him access to the letters, papers and other archives of the districts into which Roman Catholic England of the eighteenth century was divided. It was naturally impossible for any one outside the Roman Catholic community to attempt such a history, and the only works by Catholics already in existence covering the last years of the penal laws and the passing of the Catholic Relief Act of 1791 are Husenberg's "Life of Bishop Milner" and Amherst's "History of Catholic Emancipation." Amherst wrote chiefly from printed authorities at a time when the original documents were inaccessible, and his work is rather a defense of Bishop Milner than an impartial history.

There is the greatest possible contrast between the first and the second volume of Mr. Ward's history, and if it were not that the thread of the earlier story reappears here and there in the later volume, there would be little in common either as to matter or to tone and character between the two parts of the book. They might well be considered as wholly separate works, treating of entirely different subjects. The first volume cannot be cheerful reading for English Roman Catholics. In it Mr. Ward depicts vividly the decline of Roman Catholicism in England, the disappearance of one mission after another, and the generally low level of spiritual life and of worldly prosperity reached by the Catholic Church in England during the last years of the penal laws. He then enters upon the difficult and controversial task

⁴THE GREAT DIVIDE. By HENRY J. MOODY. New York: The Macmillan Company. \$1.00.

of describing the formation and work of the Catholic Committee, and relating the bitter wrangle between the English Catholic laity and the episcopal authorities which marked the struggle for Catholic emancipation. Mr. Ward writes with admirable temper, and, as a good Catholic should, always with due respect and submission; but it is impossible to read the story of the struggle between layman and priest, between democracy and autocracy, between Englishman and foreign domination, without admiration for the men who once again, and hampered by their deep and sincere religious convictions, were fighting the battle of their race for country and liberty against the authorities of their own Church. Prudent as Mr. Ward is, and ever present as the censor appears to have been to his mind, it is safe to conjecture that, as an Englishman and the son of parents who at one time were Protestants, he has little sympathy with the bourbonism, the intransigency, the brutal assertion of authority of Bishop Walmesley and his party. To Bishop Walmesley but one thing was needful for good Catholics. It mattered not whether they obtained relief from penal legislation or whether they could command the confidence of their fellow countrymen. All the struggle of the Catholic laity to prove their patriotism, and to assert their right to civic liberty, was sin and schism if it were done on their own initiative, and not under the guidance of their spiritual superiors. To rebel against "the divine established government of the Church by bishops and their authority" was to him "a crime not less than schism." "Naturally," adds Mr. Ward, "our sympathies go with the side of authority, and we feel indignant at the insults offered to the divinely constituted rulers of the Church." Mr. Ward's official sympathies may be with Bishop Walmesley; but fortunately his historical instinct has so far prevailed over these official sympathies as to enable his readers to form their own conclusions and to champion the side which appears to have the better cause. It is a remarkable evidence of the weakness of Catholicism in England at the close of the eighteenth century, and of the insignificance and negligibility of the

hierarchy, that with the party to be benefited so torn by internecine struggle, the penal laws were repealed, and that relief was extended to the English Catholics in 1791.

Turning to the second volume, we have Roman Catholicism presented in a far more pleasing light. This volume is devoted to the sufferings of the Catholics in France, Belgium and Holland during the tempestuous years of the French Revolution, and to the arrival in England of the refugees from persecution. Mr. Ward describes the break-up of the English colleges, monasteries and convents on the Continent and the transference of the orders and the educational establishments to England. Once more martyrdom kindles the light of religion; and from a decadent and squabbling sect, the Catholics of England became a religious power. Mr. Ward describes with warm appreciation the helpful kindness with which the destitute refugees were received in England, the charitable gifts of individuals, the generous assistance of the Government, and the grateful appreciation which this Protestant help won from its recipients. Even the deeply ingrained popular detestation and distrust of the orders of nuns gave way when the English people beheld these little spiritual families of women, who had gone through such trials and persecutions, who had lost all that they possessed, who had braved the terrors of the sea in tiny, ill-fitted ships, and who were cast on their shores utterly destitute, yet remaining so attached to each other, so loyal to their superioresses and to their order, that their only wish was to find a spot in which they could resume their conventual life. The fables of the convents as prisons retaining unwilling captives gave way before the sight of this faithfulness, and though here and there the nuns had to encounter some popular hostility, there was no real opposition to the re-establishment of their orders in England. For the cause of Catholicism as an English Church, and not simply a foreign Church on English soil, the re-establishment in England of the colleges and seminaries in which the training of the priests was carried on was a clear gain. The Douai priest, however Eng-

lish by birth and family, became a foreigner by long residence abroad. The priest who looks to St. Edmund's as his alma mater, with Monsignor Ward as its principal, is an Englishman first, however faithful a Roman Catholic he may be afterward. Mr. Ward's book will be of more than historical value if, read by both Catholics and Protestants, it serves as an influence to weld Englishmen of every Church into one great nation.

Rasplata (The Reckoning.) By Commander Wladimir Semenoff. Translated by L. A. B. New York: E. P. Dutton & Co. 8vo. \$3.50 net.

Commander Wladimir Semenoff, of the Russian Imperial Navy, author of "The Battle of Tsushima," translated into English two years ago, has complemented his account of the historic sea fight with one of his earlier adventures in the Russo-Japanese War. The result is a book, *The Reckoning*, that, apart from its value to the future historian, is uncommonly interesting as a human document, a seemingly unpremeditated revelation of the Slav temperament among officers and men. The record of the long trip to ultimate and swift destruction of Rojestvensky's Baltic Sea fleet fills the bulk of the book. The narrative of the slow, laborious progress of this forlorn hope—a forlorn hope composed, not of picked fighting engines, ready for a brilliant dash, but of antiquated, ill-equipped, half-prepared ships, crawling slowly on their way, breaking down, going on again, directed from St. Petersburg (it is concerning this direction and the misconceptions on which it was based that the author asks many of his unanswerable questions)—the narrative of this pseudo-fleet's cruise furnishes an interest so vivid that one comes to sympathize heartily with heroes who endured eight months of inactivity in apprehension without losing their *moral*. There were three factions among the officers—those who agreed with the optimistic hallucinations of St. Petersburg; those who believed that the fleet had a "fighting chance"; and those who knew that they were going to inevitable destruction. But all were equally determined to do their duty to the end.

Among the men the same opinions were held. Rojestvensky's picture, lonely and alone as a supreme commander must always be at sea, is well and strongly drawn. He apparently had no illusions as to the outcome of the expedition upon which he had been sent, but he kept his opinion to himself, doing his duty doggedly, in silence, taking an unseaworthy fleet safely half way around the world—no small achievement. Commander Semenoff devotes an appendix to the "Hull affair," in which he expresses his conviction that the Japanese did have torpedo boats in the North Sea, offering some curious evidence in support of his contention.

Artemis to Actæon and Other Verse. By Edith Wharton. New York: Charles Scribner's Sons. \$1.25.

Mrs. Wharton's verse is very much what might be expected from her prose. Like her prose it suffers from a certain over-obviousness of style. It is too evidently "literary." The conscientious and consistent effort to alambicate a truth, to subtilize its significance as in the titular verse and those called "Life" particularly, gives a sense of artificiality and fictitiousness to the product. Not that Mrs. Wharton has not written some rich and interesting verse; but it is too precious and curious—it is at times too downright unnatural to touch the heart very seriously.

Alcohol. How It Affects the Individual, the Community and the Race. By Henry Smith Williams. New York: The Century Company. 50 cents.

The arguments against the use of alcohol in any form are effectively presented, with a great deal of scientific testimony, in this little book. It is a brief for the prosecution. The case made out by Dr. Williams is a strong one, and he declares that even the smallest quantity of alcohol, habitually taken, menaces the physical structure, decreases the capacity for either physical or mental work, lowers the grade of the mind, lessens longevity and entails ill consequences upon one's descendants. The social or community effects of drinking are followed thru a wide range of evils, such as pauperism, vice, crime and physical de-

terioration. It is unfortunate that drinking is nowhere in these pages considered as a consequence of misery, rather than an invariable cause. For it is the increasing conviction of social students that the two things react upon each other, with now one for cause and now the other.

Literary Notes

....The first number of *The American City*, a monthly devoted to the improvement of our municipalities, contains as its leading article an illustrated explanation of the plans for the rebuilding of the national capital. [American City Pub. Co., 93 Nassau street, New York. \$1 a year.]

....A full weekly list of all new German publications is issued in an octavo pamphlet of about twenty-four pages by the house of J. C. Hinrichs, of Leipzig, under the title *Wochentliches Verzeichnis der erschienenen und der vorbereiteten Neuigkeiten der deutschen Buchhandels*. The titles and full information are given under seventeen rubrics. Full indices appear from time to time, and the pamphlet is invaluable to bibliophiles.

....One of many signs of a revival of philosophical studies is the appearance of an elaborate history of idealism, of which the first volume has just been published, entitled *Geschichte des deutschen Idealismus*, by Dr. M. Kronenberg. This volume bears the special title of "*Wie idealische Ideenentwicklung von ihren Anfängen bis Kant*," a book of 438 pages. This work depicts graphically the classic idealism of the Greeks, the Christian idealism of the Middle Ages and the Systems of Descartes, Leibnitz and Spinoza. The next volume is to be devoted especially to Kant, Schiller and Goethe. The publisher is C. H. Beck, of Munich.

....Under the general editorship of Prof. Th. Zahn, facile princeps among the conservative Biblical scholars of Germany, an excellent and thoro commentary on the entire New Testament is being published along the lines of progressive orthodoxy by the house of A. Deichert, of Leipzig, and under the general title of *Kommentar zum Neuen Testament*. The latest addition to this scholarly set is the commentary on Second Corinthians, by Dr. Ph. Bachmann, professor in the University of Erlangen, a solid tome of 425 pages. Its predecessor was the commentary on John by the general editor, a volume of 720 closely printed pages. The very best that conservative Biblical scholarship in Germany has to say, and to say critically and in detail, on the problems of New Testament interpretation, will be found in this series, which includes so far also commentaries on Matthew, Galatians, Pastoral Epistles, Thessalonians, I Corinthians, Ephesians, Colossians, Philipians and Philemon. Zahn's coadjutors are Professor Bachmann; Professor Ewald, of Erlangen; Professor Riggenbach, of Basel; Professor Seeberg, of Berlin, and Rev. Dr. G. Wohlenberg, of Altona.

Pebbles

HIS WIFE AND HE.

"Now, Will," said Josephine, "at this you began to get ready."

"Ready for what?" sighed William. "Ready for what?"

And he rolled his head against the back of his chair in a helpless sort of a way that was only equalled by the degree of languor with which he batted his eyes.

"Why, we have an engagement to call on the Olivers," she answered. "Come now! Hurry up!"

"I'm so tired," he murmured.

And his antics were such that Josephine was really alarmed, not yet having found out what a monster of deceit man is, and she ran to him and knelt by his chair with an anxious little cry.

"Poor boy!" she exclaimed, "you should not work so hard!"

He made a helpless motion such as a victim at the stake might make when asked to come to take a walk.

"Ah, that wicked, wicked Wall Street," she cried. "Will, I wouldn't do it. It isn't worth it!"

He rolled his head again.

"Will, you mustn't work so hard!" she entreated. "Oh, dear, oh, dear! Whatever would become of me if you had to go to a sanitarium?"

"Hush," said William.

"I won't hush," she cried. "I am your wife, and it's my duty to take care of you. What's the matter?"

He was rubbing the fingers of his right hand, his expression that of a man who is undergoing torture.

"Cramped," he said, "I had 170 letters to sign this afternoon."

"One hundred and seventy letters!" she repeated in awe, and, as she lifted her voice in lamentations again, I will give a few statistics concerning Josephine.

When she swept the room that morning she made 420 motions with her broom.

When she dusted the bric-a-brac she drew her dusting cloth backward and forward 510 times.

She walked in and out of the kitchen 270 times.

She made three apple pies, and she cut the apples into 180 pieces.

She also made a cake, and, in mixing the latter, she brought her spoon against the side of the bowl 760 times.

When she made the hash she chopped the chopper down 1,500 times.

She washed one of her aprons, wringing it up and down the board 180 times.

She ironed for an hour, pushing an eight-pound sad iron backward and forward 3,000 times.

For a rest she did a little needle-work, her crochet needle going in and out 3,470 times.

"One hundred and seventy letters to sign!" she wailed; "170 letters to sign! Will, do you want to kill yourself?"—*New York Sun*.

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - New York

A WEEKLY MAGAZINE. FOUNDED IN 1848.

One Year, \$2.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, \$1.75 a year extra; to Canada, \$1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of *The Independent* are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with \$1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

Is It a Lie?

WHETHER Dr. Cook reached the Pole we do not know. We have believed he did, partly because to claim that he did when he did not would have seemed too monumental and atrocious a lie, and too foolish, for an intelligent man to tell; partly because he had convinced the Danish people of his truth; partly because his statements were confirmed from Greenland by a competent authority who had talked with his Eskimo companions; and partly because his tale seemed plausible and was confirmed by similar conditions and similar speed of travel reported by Commander Peary. The latter's rude jealousy toward both Dr. Cook and his own companions made us not unwilling that Dr. Cook should have earned the honor he claimed.

But the conditions are different now. Weeks have passed, and Dr. Cook, knowing that he is charged with being a miserable impostor, still finds excuses to withhold from the public the only data of daily records and observations that might present some sort of evidence of his good faith. If he is an honest man he makes a fearful mistake in not taking the world into his confidence, instead of

telling it to wait months for what could be done in a day. We cannot believe that the geographers of Copenhagen would object. Then came the startling body of evidence against him published by Commander Peary, testimony signed by four of Peary's companions who cross-questioned Dr. Cook's two Eskimos and found them, and their father, telling the same story and declaring that they did not go to the Pole, but remained in more accessible hunting fields. And yet Dr. Cook remains silent or bids us wait more months for his proof. This evidence, apparently full and credible, puts Dr. Cook on the defensive, and yet he offers no defense. It begins to be hard to believe him.

And now comes the affidavit of Dr. Cook's one companion and guide in the attempt to reach the summit of Mount McKinley, who comes on—presumably at the expense of Commander Peary's friends, and makes affidavit that the two did not go up to the summit of the mountain as Dr. Cook claims in a book describing the ascent, but that it was another mountain they scaled, and that they agreed to deceive the world in the matter. It had previously been charged that this claim was false, but now the guide claims to be telling, and with much verisimilitude, the real truth as to a matter on which he had at first agreed with Dr. Cook to lie. Is he telling the truth now? Apparently; and once more Dr. Cook is put on the defensive. If he lied then it is tenfold more probable that he lies now; and yet he holds back the records of his conquest of the Pole, says this guide has been bribed and lies, and refers to the buried evidence on the inaccessible summit of the highest mountain in the United States. We must be forgiven if we begin to doubt; it is his fault that we do.

And if he has lied what then? If so, he can take pride in being the most infamous liar of the generation. He has lied, if he has deceived us, not to one man, nor to one group of men, but to all mankind, to total science, to the entirety of human civilization. Such a lie will deserve and will attain a multiple infamy. Out of the ruck of the common class which the Bible lumps together and consigns under one designation as "all liars"

to one ill destiny, he will stand out as nearest to the father of lies.

For not only has he, if he has proved a liar, lied to all humanity, science and civilization; he has lied for the worst, the most selfish of motives. He has done it to filch fame undeserved, to steal another man's honor, out of the meanest jealousy. It was not a case of high, if unworthy, ambition, such as tempted Satan, who "rather than be less cared not to be at all," for he has wished to steal the fame without the fact of achievement. Here is a meanness which will characterize him as not among the greatest but the meanest of mankind.

And what will he gain by it all? He will have gained, if proved an impostor, a few days of unearned glory, to be followed by a lifetime of well-earned infamy. Not one man, but all men, will despise him, and shame will dog his memory after his death. Even life will not be worth while when his failure to deceive will encircle him with glances of universal contempt. To escape every finger of scorn he would be obliged to escape humanity, to flee ever in advance of the hastening march of civilized man into African forests. Only the starving Antarctic could give him respite. Here in this present and current life, he will be forced to endure the unendurable, the self-earned infliction of a qualifiedly anticipatory damnation.

But we do not yet give up Dr. Cook to this destiny, altho he provokes us thus to speak. There is a good word which comes just now from Rasmussen and the Eskimos. He may well yield to Commander Peary the profit of a few lectures if he can only hold the honor of a good name and a great achievement.

Diaz and Taft

WE put Diaz first, for he is the senior, with one exception, of the world's executive rulers, while Taft is the President of only a few months. It is to the honor of President Diaz that he has been able for a generation to maintain peace in his great republic, so that his country may now be hoped to have reached that state when its people are educated to learn to submit to their constitution and laws. With this proof

that instability is not ingrained in the Latin nature there has come a period of prosperity, of vast development, which has made Mexico a worthy second to the United States, so that she can now be treated with on terms of equality, and the two nations can now agree to unite in guaranteeing peace in the little republics immediately to the south. President Diaz in his address toasting President Taft and the United States spoke well of the meeting of the two Presidents as an epoch in the history of the two republics, from which time only amity and mutual accord will dominate their policies with each other. Mexico is now a great nation. She will become a much greater one. Her resources are immense. Her people have become sobered and enterprising. Such a nation at our doors will teach us that there is no place for Anglo-Saxon arrogant claim of superiority. What Anglo-Saxons can do the Spanish race can also do, whether in government or in business. What tells is education and training. Diaz himself is neither Anglo-Saxon nor Spanish, but an American Indian.

The meeting of the President of the United States and the President of Mexico on the banks of the Rio Grande was purely formal and symbolic. It occasioned no anxiety in foreign chancelleries, no excitement in the stock exchanges, no demonstrations in city streets, none of the manifestations of delight, indignation and uneasiness which mark an interview between European sovereigns. When a king visits an emperor or an emperor-king, each attired in the other's uniform, and they kiss each other on both cheeks and retire arm in arm to the cabin of the yacht or an inner chamber of a palace, it is assumed by the special correspondents—we beg their pardon, the "journalistic ambassadors"—who wait outside the closed door, that the two sovereigns are absorbed in the discussion of high questions of state, settling the fate of Crete, Herzegovina, Persia or Morocco, contriving plans for preservation of peace and the increase of armaments, or at least arranging a match between their poor relations.

We are assured, however, by the same authorities that nothing of the kind was

discussed by the two Presidents in their recent interview, that political topics were tabooed, and we may assume, tho nothing is said about it that no consideration was given to the question of a matrimonial alliance between the White House and the Diaz dynasty. Yet these republican Presidents have as much personal power as a monarch in modern Europe. Mr. Taft can do more by his own initiative than the King of England, while not even the Czar of Russia rules his country so absolutely as Señor Diaz. Together the two men have in their charge the greater part of a continent, an area stretching as far as from London to Teheran or Sweden to Sudan.

As a form and symbol, however, this meeting has a value. The relations between the two countries have of late become rapidly more intimate. Sixty years ago we invaded Mexico with our armies, burning, killing and demolishing. Now there is another American invasion of Mexico, but in which we come as friends, not foes, and for the purpose of creating wealth instead of destroying it. Eight hundred millions of American capital are now invested in Mexican railroads, mines, timber lands and plantations. Our young men are turning their faces southward as a generation ago they were turned westward. Spanish is becoming as popular as French in some of our colleges and technical schools. If Horace Greeley were alive now the editorials in the *Tribune* would conclude with the advice, "Go South, young man, and grow up with the country." Modern sanitary science is making the tropics habitable without vital deterioration, and a greater stability of government will assure the safety of investments. This means that the richest region on the globe will be opened to the most vigorous races. On another page of this issue attention is called to the opportunities for settlement afforded by the fertile and unoccupied lands of North-western Panama.

It is thru the combined efforts of Mexico and the United States that Central America is being freed from the danger of wars. There is, of course, no foundation for the recurrent rumor that our republic has formed a secret alliance with the Mexican for the gradual parti-

tion of Central America, the United States working north from Panama until it meets Mexico pushing southward. But the two northern republics are anxious to extend the blessings of peace and prosperity that they enjoy to the Central American countries.

One incidental benefit of the Taft-Diaz interview should also be mentioned. It is an open infraction of the unwritten law, fast becoming a superstition, that a President should not go outside the limits of the United States. To be sure President Roosevelt broke it in visiting the city of Panama, if not in entering the Canal Zone and voyaging on the high seas, but it has been held that that did not count. A city where we exercise such prerogatives of sovereignty as tearing up the streets, fumigating the houses and policing the polls could not strictly be called foreign territory. But Mexico enjoys an unimpeachable autonomy, and in breaking bread in Ciudad Juarez President Taft broke the absurd restriction. President Taft has out-traveled the *Reise-Kaiser*. He has seen more of the world than any king of any age. It could not be expected that he would consent to be boxed in by a tradition.

Fanning the Flame

If the Spanish Government thought to strike terror into the hearts of revolutionists by the summary execution of Professor Ferrer, after a secret military trial, the Spanish Government still exhibits about as much comprehension of the facts of modern life and about as much knowledge of the world in which it exists as it did when it sent Cervera's fleet to a spectacular doom in West Indian waters. The danger of widespread revolution has been made by this monstrous blunder more acute than it has been heretofore since the days of the Commune.

For a long time past it has been plainly apparent to the observing that the inflammable human material always commingled with more refractory elements in political society was getting hot from careless exposure and undue friction and that a spark might start a conflagration. One has only to turn over

the pages of our "Survey of the World" for two or three years past to be reminded of an almost continuous series of more or less unlawful disturbances, from the violence incidental to strikes and boycotts up to the extensive revolutionary outbreaks and actual revolutionary achievements in Asia and the eastern parts of Europe; and to see that the unrest has beyond a doubt been cumulative. At the present moment the social tension is great thruout a wider area, from Spain, France and Belgium, in the West, to India and China in the East, than at any other time since the recording of historical events began. No government that sets store by its own life can afford to provoke unnecessarily the wrath that is being none too easily restrained.

It is not mere political revolution that is threatened. The social order itself is challenged, and there is not an institution or a tradition that is not under indictment by multitudes of irritated, overwrought persons on the border of mob-mindedness. The socialistic movement, notwithstanding its shibboleth of class struggle, is on the whole much more self-possessed and opportunist than it was a few years ago, but the anarchistic movement, especially in France, Italy and Spain, is distinctly more turbulent and is very rapidly extending. Observers of the industrial situation in the Latin countries know that wherever socialism has failed to obtain control of the labor movement, it is because trade unionism has become unmistakably modified by the ideas of communist or syndicalist anarchism, which would destroy existing forms of government and make the free associations, unions and federations of working men the basis of a new social order.

Coincident with this change in the character of organized revolt a disquieting change has been going on in the temper and the mental habits of the people of the western world, both European and American. Since the introduction of printing, the mind of the Western peoples has in every generation been to a great extent unified by some prevailing or popular kind of reading matter. For more than a hundred years after the Reformation it was the Bible that was uni-

versally read, and it was the narratives, the theology and the morals of the Bible that shaped the thinking and the purposes of the people in all subjects and in all relations. Today the Bible is rapidly becoming a forgotten book. The universal reading matter today is newspaper headlines, sensational news stories, "clever" magazine articles and yellow fiction. No longer wrestling with knotty problems of theology, ethics and the destiny of man, the popular mind, given over to the swish-swash of daily happenings has lost snap, and is rapidly losing the sense of evidence. Credulity, as was shown in our article the other day on "Modern Witchcraft," is reviving at an alarming rate. And when credulity has once again become the prevailing habit of the populace, if that populace is also in an ugly, anarchistic and revolutionary mood, the possibilities of destructive upheaval will be extremely serious.

That under such circumstances a government should deliberately stir up wrath is a fact that goes far to justify the conclusion that the ruling classes in Spain have not yet discovered that the days of the Duke of Alva terminated a long while ago.

Dangerous College Teaching

BISHOP McFAUL, of Trenton, is much displeased at our comments last week on an address of his, and he sends us the following letter, which he takes pains to tell us is "a public letter," and which he published in the local dailies before we could do so. We give it in full and follow with notes on numbered passages:

DEAR SIR—This morning I received an envelop containing a clipping from your periodical. No doubt the clipping was sent by your authority, as the envelop bore the address of THE INDEPENDENT. The envelop was unsealed and the postage paid was one cent [1]. This is the usual courtesy manifested by THE INDEPENDENT toward the Catholic Church and her clergy. I wish to say that there is hardly a word of truth in what you have printed.

I reiterate what I have said in my circular letter to the clergy and laity of my diocese:

Every one knows that it has been repeatedly said on the best of authority that certain attacks in our great secular universities, which have been calculated to subvert Christian faith and Christian morality. They assert that there is no truth, at least as men heretofore conceived of Him, in the seven Ten Commandments and in Church teaching as to the Bible one must be freed from all slavery to the sacred myths which it contains [2].

You stated that I should not have taken "sensational articles," as you call them, from the *Cosmopolitan* magazine [3] for my authority. The *Cosmopolitan* magazine, to say the least, is as good an authority as THE INDEPENDENT, and does not enjoy the unenviable reputation which THE INDEPENDENT has of bigotry and falsehood. My arguments were not totally based on the *Cosmopolitan* magazine. I send you under separate cover a pamphlet with plenty of authority [4]. But why should you take up the cause of the infidel professors? Are they unable to defend themselves? They certainly will not thank you for your lame defense; calling names and making comparisons regarding the intellectual attainments of men about whom you know very little will hardly serve to blind the public.

America (October 3) says "that a president of a New York college 'accuses the Bishop of ignorance' of the facts and replies.

"Why, then, does he (the president) not categorically deny that the list of religious negations we have enumerated are taught in American universities? He cannot. He also attributes the criticism of the universities to jealousy, envy and melancholy. The president of Columbia University should not indulge his pique by such vague, coarse and indefensible charges against one quite as distinguished as himself."

Let me add that neither should you; and also that I began my studies very early in life and that the educational course which I pursued will bear comparison with that of the staff of THE INDEPENDENT [5].

It is not true that certain prelates mentioned have not denounced in as strong language as mine irreligious education and everything that tends toward the destruction of Christian faith and morals [6].

You have been rash enough to attack me from knowledge obtained from newspaper reports. Why did you not follow the gentlemanly example of other periodicals and inquire what I really had said before stultifying yourself by adverse criticism? [7].

(A Public Letter.)

1. One cent is the regular legal postage, and we make no apology. We send such clippings as a courtesy to persons mentioned in our columns.

2. This is the very passage which we quoted and on which we said:

"No such thing has been 'stated on the best of authority,' and the Bishop ought not to have taken it on the credit of some sensational articles by a man who did not know the meaning of what he heard."

3. We did not mention the *Cosmopolitan*, altho we had in mind the source of Bishop McFaul's misinformation.

4. We thank the bishop for the pamphlet, which we might not otherwise have seen. It is published by his authority and contains seventeen articles from journals, mostly Catholic, of which six are devoted to attacks on colleges, based on the *Cosmopolitan's* articles, and six

to criticisms of ex-President Eliot's lecture on the "Religion of the Future," on which we, too, have adversely commented. We find in them little more than what may be courteously called a tissue of uninformed misapprehensions.

5. We do not care to pursue this line of comparative education, any more than we do to retort to the bishop's use of the words "bigotry" and "falsehood." But he may be excused for some resentment at our remark that "he is one of the least competent of his order to judge on so serious a matter."

6. Certainly those more learned prelates mentioned by us have denounced irreligious education; and so do all of us. But they know better than to use Bishop McFaul's denunciatory language as to American universities.

7. The quotation on which we based our remarks is precisely that which he gives at the beginning of his letter. Are we "stultifying" ourselves when we quote correctly, or is the bishop in a bit of a passion?

We add that we fully respect the sincerity of Bishop McFaul, and admire the earnestness with which he presses his views. He believes and therefore he speaks. He believes our colleges and universities are dens of atheism and vice, and he says so. He finds in articles in a magazine, written by the manager of a press-clipping bureau, what supports his view, and he takes it as gospel truth. We know, and graduates generally know, that the prevailing influence in our universities and colleges is overwhelmingly Christian and ethical, even altho there may be here and there a teacher who is unbelieving or indiscreet. There are doubtless many who see mythical elements in Genesis, who believe that the basis of morals rests not in the divine command but in essential social relations, and that marriage is one of those social relations which have developed their own ethics of monogamy, to mention matters in which the bishop has accepted the perversions of the man of the clipping bureau; but they may, or may not, be devout Christians after all, as devout, for example, as Professor Zahm, late of the Notre Dame University, or as the Bishop of Trenton himself.

The Campaign in New York

IN the New York municipal campaign, those who ask for the defeat of the men and the organization now in power do not make sufficient use of the facts which show that these men and this organization ought to be defeated. If Tammany's candidate for the highest office has been guilty of plotting with scoundrels to use his power as a Judge for the overthrow of just statutes, the evidence should be produced, of course, but if it be not conclusive the controversy thus excited tends to divert the attention of the public from the facts which should determine the action of voters at the polls. These facts are found in the record of Tammany corruption and waste.

This record is accessible. It should be the main subject of every campaign speech made by the opponents of the Tammany ticket. They should never fail to hold it up before the people who have been robbed. In the history of municipal politics there has rarely been a record of maladministration better fitted for use in procuring the overthrow of a ruling political organization. It is not made up of guesses or of bare assertions, but it consists of official statements, accounts, reports and other incontrovertible evidence. A part of it can be found in the reports of the official investigations which preceded and caused the removal, by Governor Hughes, of Ahearn, president of the great Borough of Manhattan, and Haffen, president of the Borough of the Bronx.

The Tammany methods of these days are not like those of Tweed. He and his associates were thieves whose ways were simple and careless. Not by their methods in these times, in a city whose annual budget has risen to the neighborhood of \$180,000,000, has a large part, probably not less than one-fifth, of the sum obtained by taxation been wasted or stolen. Processes have become more refined and less obnoxious to the letter of the law. The loot has been much more widely distributed and thus been made more productive of support at the polls. Leaders safely take considerable sums by means of their connection, concealed or open, with corporations or firms doing business with the municipality or profiting by

municipal legislative or executive favor. The public money leaks out to politicians who are contractors, to purveyors of supplies whose prices are far above the market, to politicians who speculate upon early information as to real estate which the city is to buy. For mud flats assessed at \$4,300 the city pays \$252,000 in order that poor children may have at the shore a bathing place which no one can use with comfort. Land for a park is bought at ten times its value. Material for the streets is purchased at exorbitant prices from companies in which city officers have an interest. Millions are paid for school sites but not for buildings erected on them. There is more "graft" in the sites than there can be in the structures. Municipal offices are crowded with idle or incompetent employees. Projects for the expenditure of millions in needed improvements afford high pay to land condemnation commissions composed of political henchmen. Everywhere are signs of "pull" and "divvy," but it is extremely difficult or impossible to punish the guilty under the criminal laws.

Now, there is evidence as to all this, proof of it, available for use in the campaign. Is there anything else that should be more effective in a popular movement designed to throw Tammany's men out of office? Why should such a record be neglected? Why should it not be the burden of every public address made by Tammany's foes?

The acceptance of a Tammany nomination for Mayor by Judge Gaynor, followed by his failure to denounce specifically the numerous known instances of Tammany maladministration, should be enough to convince those who were favorably impressed by his early reform activity that he ought not to be elected. Moreover, he knows and they know that his election would be accompanied by the election of a Tammany majority of the powerful Board of Estimate and Apportionment, with whose consent the practices we have mentioned would undoubtedly be continued. Of the two candidates in opposition to him, Mr. Bannard is clearly to be preferred. He is honest and competent. The great city needs honesty in its ruling officers and it also needs now, as never before, a chief

officer expert in both finance and the law. Mr. Bannard meets these requirements. In his youth he was poor; now, with a considerable income, he shares his good fortune with those who need and he is known as an active promoter of charitable and philanthropic undertakings. Thus he is in sympathy with those who suffer most from bad government. Nominated with him are men of such character and attainments that their election would surely give the city an excellent Board of Estimate and Apportionment. There is plenty of reform work for such a Mayor and such a Board. But there are many who will not be convinced that Mr. Bannard and his associates ought to be elected unless the record of Tammany misrule shall be clearly and persistently shown to voters by those who are conducting the reform campaign.

Mr. Crane's Dismissal

THE dismissal of Mr. Crane from the position given him as Minister to Peking is much to be regretted, and it is not clear that it was necessary. It is the more to be regretted because the appointment was not a political one, but given to a Democrat for his unusual knowledge as a business man of both China and Russia. We are sorry that President Taft happened to be absent when the difficulty occurred, for he is not so much of a partisan politician as is Secretary Knox, who is trained in the Pennsylvania school, and he might have been able to smooth over the trouble and not seem so to humiliate a man of such experience and competence and patriotic purpose.

The complaint made of Mr. Crane is of indiscretion in giving a newspaper correspondent information as to what the State Department had in mind to do in view of dangers threatening the open door in Manchuria. But whatever he said, the report in the newspaper did not mention his name as authority, nor did it anticipate the action of the State Department much more definitely than did a number of other papers. It does not appear why the offense, if there were any, might not have been overlooked, with a warning to one who was new to

diplomatic caution. The President—and he was President Taft's personal appointment—had told him to speak freely to the public, and whenever he had a chance, on his way to his post.

It would seem that it would have been better if a less drastic course had been taken. Indeed, the indication given in the article supposed to have been inspired by Mr. Crane's disclosures might have been passed over without notice if the State Department had not called attention to it and thus admitted that its forecast was true.

President Taft could hardly do anything else but stand by his Cabinet officer. He did the same thing quite emphatically enough in the case of Secretary Ballinger. But the end of this case is not yet, any more than we have the end of the so-called Ballinger-Pinchot disturbance. Mr. Crane has friends, in the Cabinet and out of it, and he is not willing to lie under the cloud of what he believes to be an unjust rebuke, nor are his friends. We have great respect for the ability of Secretary Knox, but we wish he might have conducted this matter with less severity.

Protection of Bank Deposits

The constitutionality of the bank deposit guarantee law was sure to come before the Federal courts, and a district court has in Nebraska declared it unconstitutional and void. That law, urged by Mr. Bryan, and incorporated into the Oklahoma constitution, which includes all legislation that could be thought of, requires all the banks to create a common fund to guarantee the soundness of every other bank in the State, so that no man who puts his money in any bank can lose it thru carelessness or fraud. The court declares that this enforced contribution deprives one person of his money to pay the debts of another, and is against justice and constitutional rights. This is on the face of it true, and yet all government is based on the right of the state to one person's money to benefit another man. The rich man is taxed to pay for the education of the poor man's children. The non-resident is taxed to pay for roads and parks which he does not enter. That

authority is put into all constitutions, and it will be a question to be decided by the United States Supreme Court whether for the general good this issuance of bank deposits can be defended.

Spain and the Church

It is a curious fact that the execution of Ferrer disturbs all Europe, but does not disturb the United States. There is hardly a protest here, certainly no riots in our capitals. The reason is, largely, because we have here no Church questions, and we have no Church questions because we have no union of Church and State. There can be no conflict between the two, because the two do not collide and clash. What Sydney Lanier says of the absence of conflict between the love of God and the love of men is equally true of loyalty to the Church and loyalty to the State. He says that the lark flying upward does not interfere with the humbler flight of the dove along the ground. Because State and Church in Europe have been united they have quarreled like a cat and a dog tied together. The present disturbance, whether called anarchistic or socialistic, is more directed against the Church, which is held responsible for Ferrer's execution; and it is likely to work ill for the Church in Spain and Italy. It is a curious conservatism which compels the Church in Europe to hold on to that which is its greatest loss and curse, support by the State, that which makes it hated by the people, at least in Southern Europe, where the people have so far lost faith in the Church. In Great Britain and Germany and Austria there is not this ill will, but in Great Britain the milder control by the Church is resented and is at the center of a large part of the political differences, the Nonconformists being all Liberals and in favor of home rule for Ireland.

United She Stands

In our issue of September 16 the following paragraph occurs: "We expect that one of these days Texas, which is a rapidly growing State, will claim its right to be divided into four States." A Texas correspondent takes strong exceptions to our suggestion. It is stated that there is no tangible sentiment in that State favor-

able to division, and that there never was a serious move in that direction. Now and then, in the interest of national political supremacy, some aspiring Texas Democrat has dared to whisper a suggestion in favor of division, but he has been quickly silenced. It is urged by our correspondent that all native Texans, without exception, oppose the division of the State, and that as the State grows older the native population rapidly increases and becomes more dominant. There is enough territory in Texas, some may argue, to divide, but our correspondent states that the glorious history of the Lone Star State is alike the heritage of all and never can be parceled out. "Never" is a long time.

The Truth Confest

We need give no other answer to those who wrote to us from the South telling us that the grandfather laws enacted in a number of States are perfectly fair and constitutional, and evade nothing in the amendments, than to quote the *Atlanta Constitution*:

"Ben Tillman's frankness regarding the true intent and purport of the Southern disfranchisement laws may not be palatable to their advocates, but they cannot, as they would like to, to assign him to membership in the Ananias Club on that score.

"If any one knows or ought to know just what these disfranchisement laws were intended to be and what they are, it is Senator Tillman. He is qualified to speak ex cathedra, and he was a rampant advocate of the disfranchisement amendments, both in South Carolina and Georgia.

"On the floor of the Senate Senator Tillman, the godfather of at least one of them, pronounces the disfranchisement laws of the South palpable frauds aimed solely at the negro, whose terms violate the fourteenth and fifteenth amendments to the Constitution and whose administration is a joke.

"We have an educational qualification in South Carolina," he said, "but we know how to handle that. There never was a negro enfranchised under it, and there never was a white man disfranchised."

"Just the same thing as was promised for the Georgia law on the same subject.

"Tersely, that is the truth of it, no matter how much we may try to conceal or suppress it.

"There is no use in attempting to play the ostrich, for it deceives no one."

Whether these laws are in terms constitutional may be doubted, but there can be no doubt as to their purpose or their administration.

ERNEST FOX NICHOLS, D. Sc., LL. D.,

Inaugurated president of Dartmouth College, October 14, 1909. Born in Leavenworth, Kan., 1869, and graduated from the Kansas Agricultural College; he later graduated as doctor of science at Cornell, studied in Berlin and Cambridge Universities, was professor of physics in Dartmouth, then professor of experimental physics in Columbia University, and has made a special study of the new department of radio-activity. He is the first president of Dartmouth who has not been a clergyman.

The New England Suffrage League is an organization of negroes to maintain equal rights and privileges, an excellent purpose. It finds plenty of wrongs to protest against; but that does not justify its official publication of an attack on Dr. Booker T. Washington, who doubtless believes in equal rights as truly as they do, even if he uses his privilege of prudence as to the noise he makes about it. We also doubt whether it makes for peace and progress to call on the colored people everywhere to celebrate December 29 as the fiftieth anniversary of the hanging of John Brown, however much we may admire the courage and justice of John Brown's motives. But we agree with the League that the objection of white men is no sufficient reason for refusing to put in office worthy colored men, and we do not see how the Interstate Commerce Commission can allow

colored passengers to be treated differently from white passengers.

We have mentioned that of all the State courts before which the question has come, only the Supreme Court of Tennessee has declared against the legality of the union of the Presbyterian and the Cumberland Presbyterian Church, and has given all the Cumberland Church property into the possession of the recalcitrant minority. Of course, this is no argument against union, and no more discourages the Cumberland men who have joined in the union than the Free Churchmen in Scotland were discouraged when the House of Lords gave their property to the rump of Wee Frees. Nor should this minor loss be used to support those who objected to a plan of union between the Congregationalists, the United Brethren and the Methodist Protestant Churches, a plan which is by no means dead yet—only care must be exercised to protect invested interests, but these interests are secondary and not final.

A simple, innocent editorial in *The Biblical World*, of Chicago, has been pounced on by sensational papers, with headlines that make it an attack on the Bible, and these have been copied so far that the editors seem to fear that the University of Chicago is damaged thereby, and they reply at length in the succeeding issue. It is the way of bad journalism, and no defense was needed. Yet we may suggest that to talk about "new theology" and "new ethics" tempts such vicious or ignorant comments. There is no new ethics; only slowly developed fresh applications of the old ethics to new conditions. To say that it is wrong to kill captive foes is now new ethics. It is nearly two centuries since Isaac Watts wrote this note to his version of one of the Psalms: "Cursing one's enemies is not so evangelic a practice. I have therefore given some verses of this Psalm another turn."

The bicycle is an ungodly craft. The bishops of the province of Emilia, in which are Bologna, Parma, Modena, Ravenna, Rimini and other well known Ital

ian towns, have just forbidden their clergy under pain of suspension to use the bicycle. To strengthen their decree they got from the Pope a *motu proprio* in its favor. As yet His Holiness has issued no brief against the automobile. A rich American has presented one to him, but he has given it to a Cardinal. The Holy See should rather condemn the airship, which seeks to make its home in the realm of the Prince of the Power of the Air.

The earnestness with which the Turkish Government is pressing educational reforms is one of the best signs for the future of the country. Salih Bey has lately taken to Great Britain and the Continent nearly a hundred young men whom he has put into European schools, and he has also committed five Mohammedan girls to the American Girls' College in Constantinople, whose expenses are paid by the Department of Instruction, and whose parents have promised that on graduation they shall teach for five years in the public schools.

Here is a good word for the old men and women. A board appointed by Secretary McVeagh to secure more efficiency in the Treasury Department reports that as a general rule the older clerks are more efficient than the younger ones, altho a good many of the oldest are not able to do as much work as their juniors. Then they ought to be pensioned on half pay, and we are glad that Secretary McVeagh is credited with a plan for a civil service pension fund and will urge it on Congress.

While the quarrel in the Church of Christ, Scientist, is very serious to those immediately concerned, it is amusing to the rest of the people. But such quarrels are not peculiar to a credulous sect. There is no religious body, no political body, that is free from them. They are a sign of life, of assertive liberty, or it may be assertive and selfish ambition. In a case like this one may well wish that something may limit or destroy the tyranny of centralizing despotism.

In Massachusetts the Democratic State platform favors the Federal income tax.

while the Republican platform dodges it by claiming that it is not a political question and must be left for discussion and decision by the legislature. It is a perfectly proper question for parties to divide on if they care to, and it is likely to turn out that the Massachusetts Republicans will oppose a proposition which was almost unanimously approved by both houses of Congress.

At a dinner given last week to Judge Gary, head of the United States Steel Corporation, by the combined steel manufacturers of the country, Judge Gary advocated an international agreement between the steel makers of this country and those of Europe. Such a combination to control the prices all over the world would raise the question how to protect the rest of society, whether by regulation or by governmental assumption of the business.

It is not necessary that an intelligent man should be able to keep the count of the past revolutions in the Central and South American republics; but luckily they are getting to be farther apart now, and that now in progress in little Nicaragua is a mere internal revolution, and so it is not required of the United States to insist on reference to the new Central American court of arbitration. If our interests become endangered that will be another thing.

The blood of St. Januarius was satisfactorily liquefied on September 19 in the presence of 3,000 people, so Naples is safe for another year. A few months ago a writer in the *Tablet*, a Catholic paper of London, ventured to question the propriety of this annual miracle, but he was quite overwhelmed by the numerous correspondents who testified to its genuineness and to the benefits which the city derived from it.

L. M. Barrie has found out by this time that a "window in Turin" does not compare with an American newspaper in the love of gossip.

Railway Movements

SEVERAL interesting events in the railway world have been reported since the death of Mr. Harriman. Some of them indicate further consolidation; others point to the continued independence of certain systems which common gossip had marked for Harriman control. Now that he has passed away, new leaders are rising. One of these is Edwin Hawley, whose purchase (in association with B. F. Yoakum and Speyer & Co.) of the Missouri, Kansas & Texas makes him the head of a system of nearly 8,000 miles, which is now closely related to the much larger Rock Island group. He already controlled the Chesapeake & Ohio, Alton, Toledo & Western, Minneapolis & St. Louis, and Iowa Central. Probably there is now to be seen the early stages of the growth of a powerful combination under his direction. It is understood that ample financial support, which in recent years he did not easily obtain, is now at his service.

Not long ago it was predicted that Mr. Harriman would eventually complete his transcontinental system by acquiring control of the New York Central. But now the conspicuous activity of William K. Vanderbilt in the practical management of the railway properties associated with his name, together with the election of Mr. Hughitt (president of the Northwestern) to fill the vacancy in the Central's board caused by Mr. Harriman's death, and also the statement recently made by Senator Depew, show that control will remain with the Vanderbilt family, whose holdings of stock are said to have been increased largely within the last few weeks. If the Vanderbilt system is to retain its old position, it is true that (for some time to come, at least) what are called the Harriman interests and policies will be dominant in the Union Pacific system. This is shown by the election, last week, of Messrs. Schiff, Rockefeller and De Forest to the board.

In New England, full control of the Boston & Maine has at last been obtained by the New York, New Haven & Hartford, thru the agency of the new Boston

Holding Company, which has acquired 42 per cent. of the Boston & Maine stock, its own stock and bonds being owned by the New Haven Company. This is the consolidation which the Government sought to prevent by a suit under the Sherman act, a suit which Mr. Taft's Attorney-General dropped. In all probability both service and equipment on the Boston & Maine will now be improved.

On the whole, these and other recent changes are by no means unfavorable to investors' interests, and it does not yet appear that any of them are at variance with the interests of the general public. In one or two instances, however, they suggest the expediency of that more comprehensive Federal supervision for which President Taft desires legislation.

....In the Federal court at Lincoln last week, the Nebraska bank deposit guarantee law was pronounced unconstitutional and void. The State will appeal to the Supreme Court at Washington.

....Joseph T. Talbert, one of the vice-presidents of the Commercial National Bank of Chicago, and president of the Chicago Clearing House Association, was last week elected vice-president of the National City Bank of New York. Ralph Van Vechten will continue as vice-president of the Commercial National Bank of Chicago. J. C. Craft and W. T. Bruckner are the two new vice-presidents of the Commercial National, whose capital now is \$7,000,000.

....Owing to the death of William E. Ingersoll, second vice-president, important changes in the executive staff of the New York Life Insurance Company have been made. E. R. Perkins has been advanced to the office of vice-president and John C. McCall and Walker Buckner have been elected second vice-presidents. Mr. McCall has for some years been senior secretary. Mr. Buckner, long in the company's service and recently in charge of the European department, will remain in charge of all the company's affairs which center at its Paris office.

The Independent

VOL. LXVII NEW YORK, THURSDAY, OCTOBER 28, 1909

No. 3178

Survey of the World

President Taft's Tour

Coming to San Antonio, Tex., at the beginning of last week, the President formally accepted and dedicated at Fort Sam Houston the new chapel given to the army post by the people of the city. In the course of his brief address he said:

"The army had not received the praise it deserves. Sometimes certain people at Washington take what you call a 'fall out of the army.' The supporters of the army do not come quickly enough or often enough to the defense of the attacks. They do not defend that army of devoted men as they should. I don't think we can afford to reduce the army at all. Some statesmen see a threat when the talk is made to increase the army. I will leave it to the people of San Antonio to say if they fear that the free institutions of our country are endangered by an efficient army of 100,000."

During the journey from El Paso he had spoken at several railway stations. At Del Rio he had said:

"I am certainly very glad to see you looking so prosperous. A man has to travel about the country to know what this country is, and in going about incidentally he is able to show himself and let the people of the country see the man they temporarily have assigned to the position of Chief Executive. I don't remember that there were a great many votes cast by this State in favor of assigning me to that position, but I am not engaged in a partisan trip. I am only going abroad trying to get information as to the condition of the country and the needs of the people. I am not here either as a Republican or as a Democrat."

On the night of the 18th he arrived at Gregory, three miles from the great ranch of his brother, Charles P. Taft, where he was to rest for four days. This ranch, whose area exceeds 100,000 acres, faces three bays of the Gulf. While resting there, the President played golf every morning. On the 20th he witnessed a round-up of 1,200 cattle, with

exhibitions of roping and branding. Secretary Dickinson spent a part of his time in shooting ducks. On the 21st, the President went to the little settlement called Taft. It is on the ranch, and it cast a unanimous vote for the Republican national ticket last year. Speaking in the schoolhouse, he said:

"I have heard of this ranch for a good many years. I heard of it from David Sinton, Mrs. Charles Taft's father, who offered me the job once, if I could not make any better living, of coming down on his ranch and naming the calves, and, while it seemed to be a work that would probably take all my time, the amount earned per calf did not seem to be enough to be attractive."

"It is a pleasure to be here and see you looking so strong and healthy and hear your contented voices. Is there anybody who is kicking? I don't think you would have him in the community if he did. This place, however, is only like a great many others. The country seems to be taking on a new development with reference to the agricultural products necessary to feed the people. It is taking this on because everything that a farmer produces is most expensive to buy. He gets the highest prices today that he ever has in the history of the country, and, therefore, every one who is looking forward to making a decent living is considering the question whether he has in him the elements of a good farmer, for there is no doubt that, taken as a class, the farmers are the most contented, the best situated, have the best homes and the best prospects of any class in the community."

"I am glad to see that the largest building in the town of Taft is the school house, and where the school house is the most important building you can be very sure of several things. One is that there is no race suicide where they need no large a schoolhouse, and the second is they are looking forward to the education of their children in order that they may become good men and women and become good citizens."

On the 22d he went to Corpus Christi and there made an address at the convention of the Interstate Inland Waterways League. Deep inland waterways, he

said, would not only extend commerce but would also control railroad rates. So far as the railroads were concerned, however, his desire was only that they should keep within the law and that their rates should be reasonable. Railroads should be encouraged. In some places, he declared, there was a disposition to do injustice to the railroads and to drive the corporations to a system of economy which prevented the development of the country thru which they pass. It was often the case that the citizens of a county would go to any extent to get a railroad into the county, but once there, not one would be a friend of the railroad except perhaps the local counsel. He urged that the railroads should have "a square deal," and that thru popular prejudice they should not be deprived of reasonable profits. Taking up the subject of conservation of natural resources, he repeated the substance of his earlier speech on this topic, saying in conclusion:

We have not yet adopted the laws, but I hope to recommend them to Congress, by which the Government shall retain some control over the use of coal lands (still owned by the Government and still to be put under private use), by which the water power sites shall be segregated from other parts of the public domain and parted with only under such conditions as shall enable the Government to procure a proper revenue therefrom and to regulate the rates charged by those who shall take possession of those sites and transform the water power into electricity."

He dined at the home of Mrs. King, whose famous ranch has an area of 1,300,000 acres. Leaving Gregory that evening, he started for Houston. There, the following morning, he addressed a large audience from the balcony of a hotel. Miss Daffan, the chief officer of the Daughters of the Confederacy, formally welcomed him and pinned to the lapel of his coat the Confederate colors, which he wore thruout the day. At Hempstead, speaking to the colored students of the Prairie View School, he said:

"I congratulate you on the opportunities for useful education which you are receiving under the auspices of the State of Texas, and I congratulate the State that it makes no distinction in furnishing those educational facilities to all its citizens."

Arriving at Dallas late in the afternoon, he went at once to the Fair Grounds

where he made an address. Just before he reached the grounds, where the waiting crowd was somewhat turbulent, Louis Richtenstein, deputy county clerk, was bayoneted by a militiaman on guard. The man was at once taken to a hospital, where it was said that his wound was mortal. In the evening the President spoke at a banquet. He was very hoarse. On the morning of the 24th he started for St. Louis, there to begin his voyage of four days down the Mississippi.

✱

Customs Frauds at New York By promising immunity, Mr. Loeb, Collector of Customs at the Port of New York, has obtained the confessions of several weighers and inspectors in the service who have been conspiring with importers to defraud the Government. Three of these men have testified freely in the pending suit against the firm of A. Musica & Son, engaged in importing cheese, figs, etc., from Italy. The first was George Brehm, formerly an assistant weigher and now an inspector, who admitted that for two years and a half he had been helping importers to defraud the Government. This he had done by reporting the weight of goods to be much less than it really was. His pay had been a sum equal to half of the duties which the importers thus avoided paying. For underweighing one consignment of cheese for the Musicas he had received \$150. Part of this he had paid to three other weighers whom he named. Two of them are no longer in the service. The second confessing witness was George E. Birge, a weigher, who testified that he began such cheating in 1901. In connection with the weighing of one consignment of cheese for the Musicas they had paid him \$194. He had also cheated in weighing sugar. The third, William N. Hutchinson, testified that for his fraudulent weighing of one lot of cheese for the Musicas he had received \$500, out of which he had paid \$120 to a weigher named Sawyer. Hutchinson admitted that he had solicited bribes from importers, going to their offices and offering to make false weights. These disclosures are believed to be only a beginning. Collector Loeb's statements to the press indicate that he has evidence of

frauds involving a much larger loss to the Government than the \$2,000,000 for which the Sugar Trust made restitution. The confessing employees say that he has not only promised immunity, but has also assured them that they shall be retained in the service. By such agreements, which are approved by the Treasury Department, he expects to obtain the proof needed for the conviction of the corrupt importers. Much of this evidence has been laid before the grand jury, and it is understood that at least thirty indictments are about to be reported. The testimony includes that of Oren Walker, an inspector already convicted, who admits that his frauds deprived the Government of about \$1,000,000 in duties.

Various Notes Justice Rufus W. Peckham, of the United States Supreme Court, died on the 24th at his summer residence, near Albany, N. Y. He was appointed by President Cleveland in 1895, being then an Associate Justice of the New York Court of Appeals. He had almost completed his seventy-first year.—United States Senator N. M. Johnson, of North Dakota, died in Fargo on the 21st, at the age of fifty-nine.—Senator Burton and four other members of the Waterways Commission returned from Europe on the 23d, having spent two months in an inspection of rivers and canals. The Commission's report will be submitted on January 1.—At Elgin, Ill., on the 19th, Speaker Cannon made a political address in which he defended himself and the House rules, attacked the Republican insurgents, asserted that Senator Cummins was an ally of Mr. Bryan, and declared that the new tariff was the best one ever enacted.—Dr. E. B. Perrin, a wealthy resident of Arizona, was convicted some time ago jointly with John A. Benson upon the charge that he had conspired to rob the Government by fraudulent entries of public land. This judgment was reversed on appeal, and a new trial was ordered. Attorney-General Wickersham now directs the District Attorney at San Francisco to drop the case, saying that he is satisfied that a conviction cannot be obtained and that he is strongly inclined to the opinion that

Dr. Perrin is innocent.—At the end of a recount of the votes cast at the recent primary election in San Francisco, Francis J. Heney, the well-known prosecutor, was declared the legal nominee of the Democratic party for District Attorney, but he had a majority of only 65 over Charles Fickert, the candidate of the Republican and the Union Labor parties for the same office.—Mrs. Ruth Bryan Leavitt, daughter of William J. Bryan, denying a recent report, says she never had any intention of running for Congress in Colorado. She will sail on December 1 for Germany, where her children are to be educated.—Recent official reports show that at the end of the last fiscal year there were 946,194 names on the pension roll. During the year 51,581 names were dropped, 48,312 of them on account of death. The payments for the year, \$161,973,703, were larger than ever before.—In the case of the Government against ex-Captain Oberlin M. Carter, to recover money alleged to have been stolen by him while engaged in river and harbor work, the Supreme Court, upon the application of the Government, has ordered a stay of proceedings in the Circuit Court with respect to his application for a grant of additional counsel fees from the fund now held by a receiver, pending a settlement of the controversy. It was shown that out of \$135,000 so held, the court had already granted \$88,000 to him for such fees.—Governor Blackburn, of the Panama Canal Zone, predicts that the canal will be finished at the close of the year 1913. A joint army and navy board, nearly all of whose members have been appointed, will soon visit the Isthmus to make an inquiry as to the fortifications to be erected at the terminals of the canal.

The Islands In the Philippines a typhoon of unusual severity swept across Northern and Central Luzon on the 17th, causing a loss of twelve lives and much property. The famous Benguet road, from Dagupan to Baguio, where the Government has established a summer capital and a health resort, was so greatly damaged that the necessary repairs, it is said, will cost \$250,000. Several suspension

bridges were destroyed. — Forty-six Russian families, in all 214 persons, have been brought from Manchuria to Hawaii, where the men will work on the sugar plantations. The Hawaiian immigration agent who procured these laborers says that not less than 100,000 Russians in Manchuria, among them many who served in the war with Japan, would like to go to Hawaii and take the places of the Japanese workmen there. — A special session of the Hawaiian Legislature has been called, to consider amendments to the Territory's organic law designed to encourage the taking of homesteads by settlers and to provide for the distribution of lands by lottery instead of by auction. — During the recent strike of the street sweepers in Havana, General Velez, Cuban Secretary of State, criticised Dr. Duque, Secretary of Sanitation, for his conduct, and was promptly challenged by the latter to fight a duel. The resignations of both of these Cabinet Ministers were placed in the President's hands. Their seconds have referred the controversy to a court of honor, and it is said that there will be no duel. — In the case against Señor Nodarse, the Cuban Postmaster-General, who shot and severely wounded the editor of a satirical journal because of an offensive cartoon, the Public Prosecutor asks the court for a sentence of imprisonment for three years and eight months.

The Revolution in Nicaragua

In Nicaragua, both the Government and the revolutionists profess to be expecting success in a short time. President Zelaya asserts that the revolutionists cannot possibly win; on the other side the prediction is made that he will surrender within three weeks. General Estrada, Provisional President and commander of the revolutionists, has appointed Dr. Salvador Castilla, Jr., Minister to the United States and has asked for recognition at Washington. Our State Department says to the public that it has been the usage of our Government "to withhold communication with the revolutionary parties in foreign countries unless they be in practical control of the machinery of government of the state administering its laws in orderly

fashion, with the acquiescence of the people, and in a position to fulfil responsibly all obligations of treaty and international law." General Estrada has issued an address in which he says:

"My sole ambition is to be of service to my country, and I hope to accomplish, with the aid of my patriotic and honest fellow citizens, the rehabilitation of liberty on this soil, forever the shrine of Nicaraguan patriotism. Our brethren of the interior, armed and ready, are awaiting us with lips set in grim determination; let us hasten there that we may obtain our liberty."

There are conflicting reports about the situation at Corinto, the chief Pacific port. Both parties claim it. The prisons of Managua, the capital, are said to be full of political prisoners. Zelaya paid at Washington, last week, the first instalment, \$50,000, in settlement of the Emery claim. Several prominent officers in the district now controlled by Estrada have accepted banishment by him in preference to imprisonment. It became known on the 25th that the first important battle had been fought at Boca San Carlos, on the San Juan River, where 1,000 of Zelaya's soldiers were routed by General Chamorra. Two Krupp siege guns and 400 rifles were captured. It is said that 100 of Zelaya's men were killed. — Two special Commissioners from Honduras are in New York, engaged in negotiations for the refunding of their country's debt by a syndicate of New York capitalists. — The revolution in Santo Domingo gains in force, and it is said that nearly all of the frontier adjoining Hayti has been taken from the Government. After a battle at Canongo, last week, the revolutionists captured Guayabin, Sabaneta and Villa Lobo.

British Politics

A way out of the deadlock between the House of Commons and the House of Lords on the question of the finance bill has been suggested by the *Times* and the *Spectator*, that is, the holding of a referendum by which the question could be voted upon by the people directly. Such a measure is entirely unprecedented in British parliamentary history and would require special legislation. In case it should be adopted by the Government, a bill authorizing the referendum and provid-

ing for the necessary expenses would have to be passed by both houses. The plan does not meet with much favor from the press. The King is actively engaged in trying to prevent a constitutional crisis and is supposed to be urging the Lords to accept the bill as it is. Whatever they may decide to do, there is no probability that an election will be held until January. The Irish land bill has passed the committee stage in the House of Lords; the compulsory purchase clause was not eliminated, as was threatened, but modified by the provision that the necessity for compulsion in each case must be proved before a special tribunal.—Mr. Lloyd-George, Chancellor of the Exchequer, has announced to the House of Commons that the concessions which had been made in the finance bill would result in a decrease in the revenue amounting to \$10,500,000, while the increase expected from the death duties, land tax and post office department would only be about \$9,250,000. In order to meet this deficit he proposed to make a further draft on the sinking fund of \$2,500,000.

The Spanish Ministry Overthrown

At the assembling of the Cortes, Premier Maura had to face a difficult situation. The war in Morocco had been unduly prolonged and expensive, and severe measures had been taken against the rioters in Barcelona, culminating in the execution of Professor Ferrer. The indignation meetings held in European and American cities showed that the outside world took a harsher view of the action and method of the Government than the Spaniards themselves, and it was impossible for the Government to hold its position in opposition to the reflex feeling which this aroused in Spain. King Alfonso is said to have had a stormy interview with Premier Maura, in which he denounced him for not having given him an opportunity to exert his prerogative of royal clemency in the Ferrer case. In the Cortes the Ministry was made the subject of bitter attacks, in which the Liberals joined with the Republicans and Socialists in declaring that they would refuse to discuss even the most urgent measures so long as Maura was in

power. The leader of the opposition was Señor Moret y Prendergast, who was Premier three years ago and who now, upon the resignation of Señor Maura, becomes the head of the new Liberal Cabinet. When the Liberals were in power before they failed to fulfil any of the expectations of their supporters, and were so divided and uncertain in their policy that they could not command a suitable majority in the Cortes. Five changes of ministry took place in eight months, and finally, on January 25, 1907, Señor Maura and the Conservatives came into power. The stability of the new Ministry is uncertain. The only policy on which the Liberal and radical members of the Cortes can unite is anti-clericalism, and they are powerless to do anything in this line because the majority of the Cortes is still Conservative and Clerical in its tendencies. The new Cabinet is expected to restore the constitutional guarantees in Barcelona and Gerona, and remove the censorship except for telegrams relating to the Moroccan campaign. The Government has announced its intention of giving the army in Melilla everything necessary for the accomplishment of its mission; still, it is not probable that its policy will be as aggressive as that of the former Ministry. There is a revival of the rumors that General Weyler, known to America for his conduct of military affairs in Cuba, will be placed in charge of the Spanish campaign in Morocco. The documents in the Ferrer case have been published by the new Government. There is little disorder in Spain at present. This is doubtless due in large part to the stringent measures of the police. Notwithstanding the numerous threats of assassination, King Alfonso has been driven in his carriage at slow pace thru the streets of Madrid, with Queen Victoria at his side.

The Czar's Visit to Italy

To avoid any unpleasant demonstrations or attempts at assassination during the meeting between the Emperor of Russia and the King of Italy, the Czar's visit was arranged to take place at Racconigo, a town of about 9,000 inhabitants, 16 miles south of Turin. Thousands of soldiers and police

were brought in to guard the sovereigns, and the entire district was under strict surveillance for days before the event took place. The Czar chose a very roundabout way of journeying from Odessa to Racconigo, ostentatiously avoiding passing thru Austria, a movement to which great political significance is attached. The four countries thru which he passed—Russia, Germany, France and Italy—provided almost a continuous double line of patrols to guard the railroad. Between Modane, on the French frontier, and Racconigo, the line was protected by 23,000 Italian soldiers. Queen Helena, the Dowager Duchess of Genoa, Princess Letitia and the Duke of the Abruzzi were in the royal party at the palace. On October 24 the two sovereigns spent the afternoon shooting pheasants and hares, and in the evening a state banquet was held, followed by a concert conducted by Mascagni. The occasion was of especial interest because it was the thirteenth anniversary of the marriage of Victor Emmanuel and Helena of Montenegro. The socialists and anarchists attempted at various cities to get up demonstrations of protest against the Czar, but they failed to receive popular sympathy because the Italian people hoped that the visit meant that Italy would receive some support from Russia in her opposition to the aggressions of Austria. The Czar was accompanied by his Minister of Foreign Affairs, M. Isvolsky, and with King Victor Emmanuel were Premier Giolitti, Foreign Minister Tittoni and other prominent officials. Among them was Signor Nathan, Mayor of Rome, whose presence in the court party was something unprecedented, since he is a republican and socialist, and a leader of the anti-clerical movement in the capital. The result of the conference between the two Foreign Ministers has not yet been given to the public.

miles. As he approached the city he ascended higher until finally he circled far above the Eiffel Tower, probably reaching an altitude of 1,500 feet from the ground. He then returned to Juvisy, dropping at dusk into the field before the grand stand, where he was received with great applause by the anxious spectators. Henri Deutsch has given \$10,000 to the aero club in honor of this exploit. The machine used by Count de Lambert was a Wright biplane. An accident occurred at Juvisy the same afternoon when M. Blanc, an inexperienced aeronaut, in attempting a flight with a Blériot machine, turned the rudder the wrong way and steered into the grand stand mortally wounding a woman and injuring a dozen other persons.—The two aeronautic meets in England during the past week failed to develop anything remarkable with the exception of a flight made at Blackpool by Hubert Latham in his 50 horse power monoplane. The wind was blowing hard in squalls sometimes reaching 50 miles an hour, but having promised the Grand Duke Michael and his wife that he would fly regardless of the weather, he made two circuits of the course. The machine pitched, rocked and soared in most birdlike manner and in going with the wind is said to have reached a speed of 80 or 90 miles an hour.—Wilbur Wright's instruction work in College Park, Md., has been remarkably successful. He has made many flights a day, often with one or two Signal Corps officers who are learning the art, and he beat all records except his brother's by carrying Lieut. F. E. Humphreys for 42 minutes. He is making some changes in his machine, the most important being the removal of one of the elevating planes from the front to the rear of the aeroplane, in imitation of the European models, which has greatly improved its steadiness.

Achievements in Aviation

The most spectacular of all aeroplane flights was made by Count de Lambert, on the afternoon of October 18. Leaving the aerodrome at Juvisy, he rose to a height of about 250 feet and headed northward for Paris a distance of 12

Foreign Notes

The frontier dispute between Norway and Sweden, which had been referred to the Hague Tribunal arbitration, has been decided. The award gives the Grisbadarne Islands to Sweden, while Norway gets Skjoette. The tribunal decided in favor of the old

Swedish boundary line.—The Russian Duma and the Council of the Empire opened on October 23. No formidable opposition is expected in the Duma to Premier Stolypin's policy. His chief difficulty will be the Finnish question. Active steps are being taken by the Government toward the annexation of the Province of Viborg. This will probably be effected next year by an imperial edict without regard to the protests of the Duma or of the Finnish Diet. It is a part of the general policy of the Russian Government for the consolidation of the empire, and has the appearance of a special act of retaliation because of the sympathy manifested by the Finns for the Russian radicals during their struggle with the autocracy. When the first Duma was dismissed, the majority of the members adjourned to Viborg and issued from there a manifesto of a revolutionary character. Large numbers of Russian troops have been placed in the Province of Viborg and in the cities of Finland. The Finns seem quite powerless to maintain the ancient autonomy of the grand duchy.—The elections held last week in Saxony were the first under the new law enlarging the suffrage. The result of the first balloting was the overthrow of the Conservative majority and the election of a large number of Socialists. In the old Diet the Conservatives had 48; in the new they have only elected 13 representatives and have a chance in 14 precincts on the reballoting. The Socialists, who had only a single seat formerly, have now 16, and will take part in 57 second elections on November 2. The National Liberals, who formerly had 31 seats, have elected 4 and will contest 27 more. The chief gains of the Socialists were in Dresden, Leipsic and Chemnitz. In the elections of the Grand Duchy of Baden on the same day, the Socialists also made considerable gains. They will have at least 10 representatives, as against 3, and may gain many more in the second elections.—A skirmish took place between the Turkish and Bulgarian soldiers on the frontier in the Serres district. Four Bulgarian shepherds were arrested by the Turks and the Bulgarian soldiers attempted a rescue.—Strong earthquake shocks were felt last week on the slope of Mount Etna and vicinity. Many of the houses

in Acireale and other villages were overthrown, but only one person was killed. Mount Vesuvius is in a state of active eruption and has thrown up quantities of stones. The disturbance is the most violent since 1906.—A new scandal in connection with the Kongo Free State has been started by the revelation of an officer of a rubber company. He claims that during the last two years the company's agents have tortured and killed many natives, burned villages and forced the natives to work for them by imprisonment and punishment.—The officers of the Greek army, who have been promoting the movement for the abdication of King George, are said to favor offering the throne to the Duke of the Abruzzi in case their efforts are successful. King George, in compliance with their demands, has instructed his three sons, who were officers in the army, to resign their positions. Prince Luigi, Duke of the Abruzzi, is a cousin of the reigning King of Italy and well known to the world because of his exploits in mountain climbing and Arctic exploration. The Military League is becoming more arbitrary and dictatorial, as it meets with no effective opposition from Government or King. It has gone so far as to force the King to dismiss from the army the two prominent officers who remained loyal and refused to join in the recent mutiny.—The first steps toward the establishment of a constitutional *régime* in China were taken on October 14, when, in accordance with imperial edict, provincial assemblies were held to consider desirable changes in the form of government and to elect delegates to a national constitutional convention. The assemblies have only advisory powers at present, but may later develop into legislative bodies for their respective provinces. The members are drawn from the gentry and student classes, but officeholders are excluded.—The dispute between the Russian authorities at Harbin, in Manchuria, and the German consul, has been settled by the withdrawal of German protection from the brewery which refused to pay the Russian taxes.—The Turkish Government has refused to compensate foreigners for the losses occasioned by the Adana massacres, on the ground that the disturbances were unavoidable.

A Vacation Idyll

BY E. P. POWELL

TO my taste vacation should never be in the summer, but in the winter.

I would run away from the frost spears rather than from the hot rays of the sun. I believe that our schools even would do better if they were built in big groves, with orchards and gardens, and kept open all summer, giving them a three months' vacation in the middle of winter. I am getting more new fashioned as I grow older, and less able to sit down quietly and let the world take its pace. At any rate, my vacation begins in November, and it begins on an ocean steamer headed for Savannah. Of course, we must hustle our apple picking and get the last of the crop into our customers' hands before we turn the key and follow the birds.

Florida is so entirely unique among the States that to know it is to know a new world. I had heard of it only thru tourists, and supposed it was a flat spread of sand, where one might mostly see lagoons full of alligators, but on the higher grounds, orange groves and gardens of pineapples. When I found the real Florida I discovered rolling hills, holding between them the most charming little lakes, and covered with pines standing 80 feet high; where the seasons got so mixed that they averaged a continual June. One must think twice in midwinter to be sure it is not midsummer. I found the trees as much puzzled as myself, not knowing just when to blossom or when to go to sleep. This backbone of Florida is 100 miles long and 50 wide, and is almost unknown to tourists.

Our Lakes.—Our lakes are rather small bodies of water, from half a mile to 5 miles in diameter, of all shapes, and generally surrounded by high sloping land. They must be very old bodies of water, for the bottom of them is deep with muck, as black as night. They are just big enough, many of them, to wrap right into your farm homestead and call your own. The pines stand close about them and look at their faces in the water, where they are as distinct as on land. I have Lake Lucy in front and Lake

Emerson at the rear. The first of these is half a mile over it, and is such a mirror as artifice could not construct. The sun going down thru the big pines, at night, lays great beams of scarlet, like a bridge, over to my side. There is an alligator somewhere in its sandy bottom, and he shows himself occasionally, but is harmless and interesting—a fine sample of a departing race. Ducks cleave the water in large numbers, shouting gleefully as they swim races or dive and swim under water. So quiet is the water that one may row out to the middle of the lake in the early morning and write an article for *THE INDEPENDENT*. While he is there white egrets and blue herons will be fishing around the borders, and mourning doves will be calling from a grove of young pines just at the head of the lake. I know few things more beautiful and entrancing than one of these gems set in green, to be played over and enjoyed by all living creatures—the very ideal of perfect peace.

Our Parks.—A pine forest is always a grove, and not a close woods, like ours at the North, of beech or other deciduous trees. It resembles a village park, as if gracefully planted by some skilful landscapist; only these great Jove-headed pines have been growing two hundred years or more, for many of them are 100 feet high, and their shafts, 2 feet in diameter, are clean of limbs for the first 60 feet. The rough bark resists fire, so that when the annual burning over occurs not many trees are injured—only, if one do get on fire, what a furious torch of pitch it is! Long tresses of Florida moss hang down from the higher limbs, and, swaying gracefully, tell you which way the wind blows. Our roads wind about under the trees, trailing their way from home to home and town to town, almost always favoring you with shade.

Our Mornings.—Morning is the glory of the day anywhere. I pity the night-hawks, who sleep away the sweeter part of life—when the dew is gemming the grasses, and the honeysuckles about the house are sending greetings over to the

clover in the meadows. Our Florida mornings are the most delightful in the world. The nights are invariably cool, and the mornings have that sweet freshness, fragrant with orange blossoms and pine exhalation, which make it impossible for one to remember that he ever had an ill. About eleven o'clock the days grow warmer, but breezes meet each other from the Atlantic and from the Gulf. Queer sounds they make, inquisitively hunting thru the forests and up the bay-heads. A northwester once or twice a year comes blowing his fingers thru the pines, but he soon sweats himself into moderation.

Our Nights.—Our nights are a new kind of day. These pine needles do not cut off the moon rays, as do big-leaved trees, and the shadows seem to go walking about with you. The lightning bugs in February fly away up in the tree tops, and they give long streaks of nearly continuous flame. Occasionally, over the lake, one of them sees his reflection as an inviting mate, and he dips down to drown love forever. There are some spells so quiet, so sincere, when the moon and all the stars seem surely talking to us, that I feel I am attending a convention of the universe.

Our Wild Flowers.—These are never quite absent, but after the first of March they begin to revel and riot in their abundance and variety. Real spring begins with February, and by the middle of that month the blue violets on long stems stand up with the new grass, blinking at you as you pass by, and every one wondering that you do not stop to pick it. But then it is violet time all the year round. As the days widen you should see the wild children multiply, almost all of them legumes, with big roots. I have heard their names, but Nature did not put on these tags, and I do not care to remember them. They are as beautiful as sweet peas, and most of them are lavender and yellow, but the Cherokee bean stands in huge spikes of brilliant scarlet. I thought to sod my two acres of front-age; but when the sensitive plants spread me a delicate carpet, and a thousand legumes shot their novelties up thru, I said, "No art can equal this; let it alone." So my yard will be a wild flower garden always.

Our Birds.—The first to greet us in the morning is the mourning dove, plaintively calling from the distance, with notes holding a good deal of ventriloquism. Bob White then comes marching thru your lawns, only sometimes he leaves off the *bob* and simply says *white*. There are a lot of fool Northerners, who come down here and shoot every one of these beautiful and useful creatures that they can find—for no other reason than because they lack souls to appreciate the beautiful. Now the cardinal bird is singing in the orange grove, a flame of scarlet even brighter than our tanager. Mocking birds are everywhere, singing a repertoire of nonsense, either backward or forward as it happens, and never anything like as musical as a catbird. He is a tame, saucy, sociable fellow, eating mulberries, and ready to pick up at your feet any bit of food that he likes. The red-winged blackbird is our real musician; in flocks in the pine tops you might take them for a band of Swiss bell-ringers—silvery and sweet beyond compare. Some years the robins and the bluebirds are here in vast numbers, filling our bayheads with eternal chatter and song, and surrounding our lakes in clouds; but some years they do not show up at all.

Our Verandas.—Our verandas are the best part of our houses. We make them broad and at least half way around the whole house. Ten or 12 feet deep is none too much, and then you should enclose the whole with wire netting and a screen door, so that it shall be fly-proof. As for mosquitoes, we have so few here that we do not mind them. When you have well defined your veranda, two stories high possibly, and supplied it with Morris chairs and rattan rockers, and hammock beds, you need say nothing more about your house.

Our Fireplaces.—Yes, there is one more feature of a Southern home worth talking about. Of course, we burn pine knots and the big cones which drop liberally everywhere. There is enough of them to defy waste for one hundred years, and, as most of my 200 acres are pine parks, I for one shall never catch up with the need of firewood. The pine is so full of pitch that a newspaper will set it on fire. About five o'clock of an ordi-

nary winter's day the fireplace is throwing out a delicious fragrance and a welcome heat. We toast our feet, tell stories, think about our Northern friends, and after supper read the papers, get sleepy, and go to bed.

Our Oranges.—This is the one thing that you cannot exaggerate, for an orange grove or orchard is a thing of delight all the year round. The round-headed trees, limbed nearly to the ground, are beaten by nothing in the world, either in flower or in fruit, but by an orchard of apple trees. The white orange flower cannot compare with the king of fruits dressed in pink and white. Yet wonderful is this cloud of fragrance that rolls over the world from an orange grove; and marvelous is the beauty of a grove loaded with golden balls that bend the limbs down in graceful curves. You can eat a half dozen before every meal, and do no harm to your stomach or your conscience. There are enough for everybody and all.

Our Neighbors.—Of course the human is the most important affair, even in the woods. Most of the folk are Northerners, and a good average lot they are; opinionated as people ought to be; but opinions that are worth anything are like two whetstones; rub them together and both vanish. The Crackers make splendid farmers and are fond of razorbacks. These animals are sometimes classed as hogs, but a hog has some virtues, and a razorback has none. He knows every sweet-potato patch within ten miles, and he studies diligently how he shall get at them. Unfortunately he

has brains. The negroes are a quiet and clever lot, with a good deal of working capacity, and under a slow momentum of betterment.

Our Tourists.—A genuine tourist is a curious creature; his eyes continuously rolling, yet seeing nothing beneath the surface. He goes blindly anywhere and everywhere, paying astounding bills, and rather proud of it. He rarely gets one hour of comfort, and after he has spent his roll he goes home supposing he knows all about Florida. The proper thing to do, if you wish to know the country, is to settle somewhere; build a home, have a garden and orchard of your own, and a lake also if you can. In a couple of winters you will have saved enough out of hotel bills to pay for a snug cottage and ten acres of land.

This is the way to spend your vacation. If you are a Yankee, with Yankee hands, you can build most of your house yourself. You will then have fish from your lake; oranges, loquats, plums, persimmons, pears, mulberries, huckleberries, blackberries and strawberries in your orchard; eggs and honey in your back yard; all sorts of vegetables in midwinter, and bushels of roses all the time. You can come and go as you please, and you will study the country from a vantage point. Your outgoes need not exceed one dollar a week in cash. A teachers' club could do even better. You could rent or own a cow and horse, and all winter, while the North is racked with storms, you will have weather so nearly perfect that some of you might throw up your commissions.

CLINTON, N. Y.

The New Theater

BY WILLIAM LYON PHELPS, Ph.D.

LAMPSON PROFESSOR OF ENGLISH LITERATURE AT YALE UNIVERSITY.

ON Tuesday, December 15, 1908, I went to New York to attend the exercises in celebration of the laying of the cornerstone of the New Theater. It was a memorable occasion, and some of us felt that history was being made. Mr. William K. Vanderbilt was the presiding officer; speeches were delivered by the Mayor, by the president of the college, by Augustus Thomas, the four men representing the founders of the institution, the government of New York, the university, and the stage. A poem was read by Richard Watson Gilder and the "Star Spangled Banner" was sung by Geraldine Farrar—sung better than I had ever heard it sung before, even tho the words were not correctly given. Easily recognizable in the audience were actors, managers, playwrights and men of letters; the most conspicuous figure was glorious old John Bigelow, who, at the ripe age of ninety-one, was, as is his way, looking forward and not back. I had for some weeks so keenly anticipated the pleasure of this day that, before walking over to the theater, I thought I would see what the great metropolitan journals had to say about it. To my intense surprise, I found that the

Sun, the *Times*, the *Tribune* and the *Herald* for December 15 contained not one word, either by way of news or by way of comment, concerning the fact that the cornerstone of the New Theater was to be laid that afternoon. And on the next day there was not a single allusion to this event or to the enterprise on the editorial pages of the *Sun*, *Times*, *Tribune*, *Herald* or *Evening Post*.

The hostility of the so-called Theatrical Trust to the New Theater is not wholly easy to understand, nor did I believe it to be a fact until I read in the *Sun* for January 16, 1909, a column account of the fifth annual dinner of the Association of Theatrical Managers, which took place the night before. The speech of the evening was made by Mr. Abraham Lincoln Erlanger, who seemed on this occasion to lack some of his accustomed cheerfulness. He did not like the New Theater, and said so, with that frankness of speech characteristic of his offhand remarks. As reported in the *Sun*, he declared in an ironical manner:

"Probably a new theatrical era is about to dawn upon us. The millenniums, having tired of ping pong and the horse show, are now taking up the management of grand opera and the

theater as a hobby. . . . And what is going to be done there? Create new stars? No; they are going to offer positions to the stars that were made thru your energy, experience and capital. They certainly do not want us to think that the New Theater is intended as a place of amusement for the people. Many hundreds of millions of dollars are invested in theaters throuth the country, all of which were acquired before the millionaires took up theater management as their pastime. The successful stars I have referred to all made their reputations and pleased theatergoers before the millionaire angel appeared on the scene. The first tune that is played in the New Theater ought to be:

'I want to be an angel,
And with the angels stand.
For a crown upon my forehead
I'll have a checkbook in my hand.

"I see that at the Metropolitan Opera House they have called in dramatic physicians. I hope that Drs. Dillingham and Latham will be able to relieve the financial plan, but take it from me, when they call for first aid to the injured at the New Theater it will be surgeons they require, and veterinaries at that."

I have a high respect for the shrewdness and worldly wisdom of Mr. Erlanger; there can be no doubt of his ability as a man of business. Why should he be so angry at the New Theater? Is it possible that he is afraid of it? Some years ago, when the project was first seriously discussed, it was ridiculed because of its certain lack of financial support; that being now assured, it is ridiculed as a plaything of the rich. Not long since its enemies informed us that no actors could be obtained except those out of a job; the list of actors and actresses already engaged completely disposing of this difficulty, we are told that the New Theater has no right to take stars "made" by a group of successful business men; in other words, that it is poaching on other people's preserves. If any one really believed that the New Theater was a thing of no importance, or an enterprise without a future, the rage of its powerful antagonists would seem to prove the contrary.

Whatever may be thought of the Theatrical Trust, it contains at least one man who has done a great deal for the welfare of the drama in New York. That man is Mr. Daniel Frohman. He is not given to making speeches, and he dislikes controversy; but those of us who remember the old Lyceum Theater, with its admirable stock company, the quality of the plays selected for representation, and the

manner in which they were given, will never cease to be grateful to this astute manager for the pleasant evenings spent in that delightfully intimate little auditorium. There is a good deal of talk nowadays about ideals in dramatic art; I have no hesitation in saying that I have always believed Mr. Daniel Frohman to be a man of high ideals, and that it would be hard to find anywhere in America a manager who combines so much knowledge of the stage and so much practical business judgment with so much earnestness of purpose. The methods and aims of the New Theater are not very different from his own; we are to have a good stock company, who are to give, at the regular Trust prices, both classic and contemporary plays.

In February, 1903, the American Dramatists' Club appointed a committee to originate and define a plan for the organization of an endowed national theater. The committee met and tentatively announced a scheme, of which the first statement was in this wise:

"To construct and maintain by private endowment and personal subscription in New York a modern theater of American type, devoted to the advancement of American dramatic and theatric art, the chief object being to present worthy American plays, the repertory also to include the classic and standard plays, American and foreign; the manager to be an American."

All hope of municipal, State and national support was wisely abandoned; it takes many years of tradition and a thoroughly educated public to bring about such a consummation. In the present condition of municipal politics in the United States a subsidized theater could hardly hope for permanent success, and might easily become the laughing stock of foreigners. The only way—the way adopted by the New Theater—was to raise the necessary funds by private subscription, which meant, of course, that the much-maligned malefactors of great wealth had to be depended on, as is always the case in this country when any intellectual or charitable enterprise is to be launched or maintained. I do not know how bad modern American millionaires really are; but as I travel about and see the results of their generosity in the permanent form of hospitals, churches, public libraries and universities, I wonder what on earth we should do without them.

The New Theater is now an accomplished fact. The first performance is announced for the night of Monday, November 8, tho as I wandered around the vast structure from pit to dome the other day, it seemed impossible that the stage and auditorium could be made ready by that time. But in New York miracles happen every day, and "the thing that couldn't has occurred" so often that one takes the impossible for granted. The building is superb, both without and within, and with the grounds cost about \$3,000,000. The material used for construction is Indiana limestone, and the architecture is in the manner of the Italian Renaissance of the late sixteenth century. The façade occupies an entire block between Sixty-second and Sixty-third streets, and looks out on Central Park. The capacity is 2,200 persons; every spectator must have a chair, and no standing room is provided. The auditorium is built in much the same fashion as the Hippodrome, being broad and shal-

low, with the long axis running parallel to the footlights. This is the best possible arrangement in a large theater both for seeing and hearing. The stage is 100 feet wide, with a proscenium opening 42 feet by 40. The height from the stage floor to the top is 112 feet, and the depth below the floor 42 feet. Every seat in the house is so constructed as to command a clear view of the stage. The parquet floor has a steep grade, and the shallow shape of the vast room makes one sitting in the last row feel surprisingly close to the curtain. Directly behind this last row of the parquet floor are the boxes, at an elevation of only 4 feet. This is the only row of boxes the theater contains, and directly over are the foyer stalls; behind these, at a slight elevation, are the seats in the first balcony, and above, running up and far back, are the gallery chairs. There are so many easy exits that it is estimated that the entire building, both stage and auditorium, can be emptied in three minutes. The whole interior of

DETAIL OF FRIEZE, THE NEW THEATER.

From a photograph by Frances B. Johnston.

the theater is constructed of cement, all welded into one mass, so that the great edifice is in reality one solid block.

No cost has been spared on ornament and interior decoration. The main foyer is simply magnificent, without being in the least gaudy or garish. A great corridor runs entirely around the rear of the lower floor, flanked at the corners by two huge spiral staircases of remarkable beauty. These staircases are each double, one flight being directly over the other. Every floor of the building can be reached on foot with the greatest ease, and the decorations are so splendid that one feels as if one were taking part in a triumphal march.

The New Theater is not merely a place where actors appear on the stage and spectators sit in the auditorium. It is literally a home of the drama. Like the best theaters abroad, only a portion of the building is taken up with the space

directly before and directly behind the curtain. The comfort of both players and auditors has been provided for by a vast variety of rooms. I visited them all, and each apartment looked like a good place to sit down and stay awhile. One of the chief features is the library, for the use of members of the company. This is a beautiful room, an education in itself. The actors' dressing rooms are spacious, well fitted up, and provided with every modern convenience in the way of glass and electricity. A greenroom, not much heard of in America in these latter days, has been fitted up for the exclusive use of the players, and is a most attractive place. This is intended wholly for social intercourse, and after the theater begins its performances in November the greenroom will never be open to the public. For the comfort of spectators there is a large tea-room, a grill-room, and plenty of retiring rooms; and the top floor of the

theater contains a big roof garden, overlooking Central Park. This is partly roofed with glass; the doors are all made of glass and lead to an open air front terrace, which is sure to be popular in pleasant weather.

The director of the New Theater is Mr. Winthrop Ames, a native of Boston and a graduate of Harvard in the class of 1895. Shortly after leaving college he made a practical study of the drama, with the aim of founding in Boston a "new theater." He studied details in the only place to study them—Europe; then with a partner he leased the Castle Square Theater in Boston, and for four years, in winter and summer, directed a stock company, at the same time having complete control of the financial side. There was a weekly change of bill, the affair prospered, and attracted wide and favorable comment. Thus having proven his ability, and justified the confidence of his friends, he again went abroad and made a careful investigation of over sixty European playhouses; he then returned to Boston, bought a site, had plans drawn for his proposed building, and gave them up only to assume the directorship of the New Theater. Mr. John Corbin, the literary manager, was born in Chicago, and was graduated from Harvard in 1892. After taking graduate work at Harvard and spending a year at Oxford, he engaged in miscellaneous literary work, and for seven years was a dramatic critic in New York, serving on *Harper's Weekly*, then on the *Times* and later on the *Sun*, where his Sunday articles on the drama became notable for their thoughtfulness and independence. He is the author of a play which is to be produced, not in the New Theater, this season. Mr. Lee Shubert, the business manager, is well known all over the United States for his ability in handling large theatrical enterprises. His own firm is entirely separate from the work of the New Theater, but he brings to it his long experience and practical skill. These triumvirs constitute the directorate, and it is difficult to see how a better management could be found. It is not out of place to pay a passing tribute to Prof. George P. Baker, of Harvard, who has for years been a great stimulus to the study of the modern drama in that

university, and in whose classes both Mr. Ames and Mr. Corbin were enthusiastic pupils.

The directorate has had little trouble in securing competent actors for the stock company. An actor in a stock company does not make so much money as a successful star, but his privileges and opportunities are so great that the attraction is strong. Instead of acting every night, he appears only on certain evenings; instead of traveling all over the country in one-night stands, he lives in New York, and has a home; he can be a citizen, can live a responsible life, and educate his children. His intellectual growth is assured, for his *rôle* changes, now classic and now modern; the wearisome repetition of the same part every night in a year is deadening to anybody. (I met an actor once who had appeared without one variation in "Brewster's Millions" for three years!) Then his future is assured by contract. The lot of an actor in a foreign stock company is far more enviable than that of a star under our system. In Munich many actors sign a contract to one house for ten years ahead. Then they can settle down, have a domestic life, own a home, and become active and respected members of the community. There is simply no comparison between such a career and the hotel-and-railway existence of the American thespian.

Some of the best-known members of the New Theater company are Mr. Edward Sothorn and Miss Julia Marlowe, who are not only warm favorites with the public all over America, but who have repeatedly shown a love not for "high-brow" drama, but for the drama of cerebration, to which none but fools can seriously object. Then there is Mr. Ferdinand Gottschalk, an excellent and finely intelligent character actor; Mr. Albert Bruning, who has appeared with Booth and Barrett; Mr. Charles Cartwright, an Englishman who was in the company of Henry Irving; Mr. Ben Johnson, who was with the late Mr. Mansfield; and much is expected of Mr. Jacob Wendell, who for years has achieved remarkable success as an amateur actor, and who will now for the first time be seen as a professional. Among the actresses we shall have Miss Rose Coghlan, whom

many of us saw on the stage twenty-five years ago; Mrs. Sol Smith, who is now only seventy-eight years old, and apparently has a long and bright future on the stage. She does not know how to be old, except in rôles requiring the simulation of age; her interpretation of Juliet's Nurse is deservedly admired. Miss Beatrice Forbes-Robertson, who has acted with Irving, Tree, Wyndham, Hare, Alexander, Bouchier, and others, is certainly not lacking in experience. The chorus and the supers are having long daily rehearsals, and the high expectation of the public bids fair to be reasonably gratified.

Opera is to be given as well as drama. Twenty evening and twenty matinée performances of the former will be given during the winter, under the direction of Mr. Dippel, and the singers will come from the Metropolitan Opera House. Of the plays, about one-third will be "classic" and the rest composed of modern comedies and plays of wide appeal. On the opening night "Antony and Cleopatra" will be presented, and it is safe to say the spectacle, both on the stage and in the auditorium, will be notable for its splendor. Later a new play by Edward Sheldon, author of "Salvation Nell," will be given. This is to be called "The Nigger." Mr. John Galsworthy's powerful social drama, "Strife," that recently attracted so much notice in London, and has since been published in America by the Putnams, is also to be seen at the New Theater this season. I, for one, deeply regret that the management thought it necessary to shift the scenes from Britain to Ohio. Have audiences, then, no imagination, and must we transform geography in order to make human nature seem like itself? Why not put Rosalind and Orlando in the Bronx? I sincerely hope this does not mean that all foreign plays are to be "adapted" for American use. A play by Brieux, one of the most thoughtful and interesting of all contemporary dramatists, will also be produced, and other announcements will follow. During the presentation of operas the orchestra plays in a pit before the footlights, depressed below the level of the floor; on nights when plays are given there will fortunately be no orches-

tra in the auditorium, but music will be heard in the grand foyer between the acts; and, while the people are walking up and down, enjoying music and conversation, a most ingenious system of ventilation will thoroly cleanse the audience room of every atom of used-up air.

The great obstacle in the way of successful presentations of domestic dramas and *pièces intimes* is, in my judgment, the size of the New Theater. An auditorium that seats 2,200 people, even tho arranged in the admirable manner described above, is altogether too big for the enjoyment of conversational plays. For a great spectacle like "Antony and Cleopatra" and for opera nothing could be better; but this country does not need Shakespeare and grand opera nearly so much as it needs the intelligent production, intelligent acting, intelligent setting of modern intelligent plays. The evenings in Europe that a lover of the theater remembers with the keenest delight are those spent at the Deutsches Theater, Neues Theater, and Kleines Theater in Berlin; at the little Schauspielhaus and Residenz-Theater in Munich; at the old Théâtre Antoine at Paris, and one does not forget the success of the management in making the Comédie Française look like a small house, which it isn't. We must not prejudge the New Theater; perhaps the directorate will find some way to solve this difficult problem; but I wish that in this vast building room had been found or made for the construction of a small theater within the theater, for a wing or corner holding a small stage, and an auditorium seating not more than 500. Such a room is the only place to enjoy to the uttermost plays that are meant for the ear rather than for the eye.

Notwithstanding this particular difficulty, every one who has the real interest of American drama at heart will rejoice in the erection of the New Theater. Its possibilities are enormous, and it has long been needed. If, in addition to the dignified presentation of really interesting drama, it can do something toward the education of American audiences, it will prove indeed a blessing.

NEW HAVEN, CONN.

Richard A. Ballinger

SECRETARY OF THE INTERIOR.

BY WILLARD FRENCH

FEW have ever stepped from private life to accept a Cabinet portfolio better posted as to the coming requirements or better prepared to fulfil them than Secretary Ballinger, of the Interior Department. This fact must be taken in account in considering the recent more or less unpleasant publicity which has been given Mr. Ballinger, in connec-

rying out the Roosevelt policies of conservation, which the Forest Service has deeply at heart.

Secretary Ballinger is an intensely vigorous, tall, broad-shouldered, keen-eyed man, with a round, rather pugnacious face, especially in the set of the lower jaw; quick and concise of speech; a cordial and agreeable man to meet on

RICHARD A. BALLINGER

tion with certain acts of the Department, rather conflicting with the sister Department of Agriculture, and especially with the Forest Service, in the course of car-

friendly terms, but moving in an atmosphere which instantly suggests other possibilities if occasion requires. He is energy, action and determination person-

ified. He comes from a line of fighters, from as far back as an ancestor on the staff of "Mad" Anthony Wayne, who fought at Yorktown and Stony Point. The whole family has been given more or less to wandering and adventure, and the Secretary of the Interior is no exception. He crossed the country several times before he fixed upon Seattle, whence he was summoned to the Cabinet.

Secretary Ballinger's father studied law in the office of Abraham Lincoln and was an outspoken abolitionist, if anything a little in advance of the coming President. He fought thru the Civil War, coming out with the family record well sustained and the title of "Colonel Dick." His son, the Secretary, was born in Boonesboro, Ia., in 1857, and began his fighting career when only six years old, spending several months with his father in camp at Milliken's Bend, near Vicksburg, where the soldiers made him a drum out of an old box, and he marched about with the musicians at the head of the regiment. After the war they moved to Nilwood, Ill., where Colonel Dick invested in sheep. The coming Secretary of the Interior herded them all day over the prairies, with a dog, bringing them home at night. Then his father received appointment from President Grant as postmaster at the village of Virden, and the son took charge of a news stand in the corner of the post office, selling papers on the street in the evening. When his father purchased a small weekly newspaper the son immediately learned to set type and pulled the hand press—thanking Heaven that the edition was not large.

When he was fifteen his father moved to what is now the town of Larned, Kan., where he invested in cattle, and for three years the boy sat mostly in the saddle, winning his title of cowboy. As the Secretary put it, he only went to school now and then, but while riding herd he committed to memory a lot of Robert Burns and studied Greek and Latin, reciting Latin to the hospital steward at Fort Larned and Greek to a clergyman who lived in the neighborhood. Then for two years he was deputy clerk in the office of the county clerk and treasurer of Larned, and with the money earned he spent three years at the State Univer-

sity at Lawrence and at Washburn College in Topeka. With this start at an education, he worked his way through Williams College, graduating at twenty-six. He was admitted to the bar in Springfield, Ill., when twenty-nine, and with characteristic energy and courage, forthwith married the sister of a classmate, now Dr. W. P. Bradley.

Speaking of his resources at the time, the Secretary says: "I had nothing but nerve and energy and an optimistic view of the future; but it was the best thing that could have happened." He began practising law in Kankakee, Ill., where his father was publishing a paper, and served for a year as city attorney; then filled the same office for a year in New Decatur, Ala., before striking out for the West. In Port Townsend, Washington, he was elected Superior Court judge and served four years, making his final change to Seattle in 1897, where, seven years later, he was elected mayor and in 1907 was appointed by President Roosevelt Commissioner of the General Land Office.

Ballinger's climb up the ladder was not so prosaic as such a recital makes it sound. It was constantly interspersed with outbreaks of irrepressible energy, in which the child was father of the man. For instance, while beating his box drum before Vicksburg, the six-year-old took occasion to "buck and gag" a young negro, for some offense, as he had seen a soldier bucked and gagged for chasing his officer with an axe. While attending school "now and then" at Virden, he thrashed a boy for abusing his dog, and was soundly thrashed in return by the teacher. While riding herd in Kansas he killed several rattlesnakes to clear a place to spread his blanket for a nap, on Rattlesnake Creek, fixing upon himself a tale which will be told of him on every possible occasion, as the Root horse story is told of President Taft, the rabbit story of Loeb, etc. While practising law in Alabama he was characteristically blunt and vigorous in his speech and proved, at a trial, offensive to the Southern tastes of a Mr. Jones, who was attorney on the other side. Mr. Jones informed him that something would happen the next time they met on the street. It did. Mr. Jones struck him with his

fist, then reached for his hip pocket. This succession of events was an error of judgment on the part of Jones, for it gave Ballinger an opportunity to catch him by the throat, which he did, and held on till witnesses separated them. As Jones immediately died of yellow fever, the incident was closed. When elected Mayor of Seattle he found the city in a most unlawabiding state. The rush to Alaska for gold and the returning tide of miners, gamblers and whatnot had produced there about the worst of bad conditions. Ballinger cleaned up that lively town in a way that surprised the oldest inhabitants. In six months he had a refreshing, wholesome and respectable place; but it was hard work, and when asked to stand for re-election he insisted that one term was enough. While sitting on the bench he wrote the law book which is widely known today—"Ballinger on Community Property," and later compiled "Ballinger's Codes and Statutes of Washington," which has probably given him his widest reputation at the bar.

Ballinger was a year ahead of James R. Garfield, at Williams College. Garfield was Secretary of the Interior and wanted a vigorous man for Commissioner of the General Land Office. He knew of Ballinger's work in Seattle and suggested his name to President Roosevelt, who wired him to come to Washington. There were reasons why Ballinger didn't want to come to Washington and reasons why he did want to come, but the story of the snakes on Rattlesnake Creek and the snakes in Seattle satisfied President Roosevelt that Ballinger was the man he wanted and that settled it. Ballinger

came to Washington, and for one year worked under Garfield in the Department of the Interior as General Land Commissioner.

He went back to his private practice in Seattle, but not for long, for the vigorous strokes which he put in for Taft, before and after the convention, marked him, and the Interior Department was evidently the place for him. Being Secretary of the Interior is of no great moment, in Eastern eyes, where public lands are unknown, but in the West a great deal depends upon the Secretary and the position he takes. As a matter of fact, the Secretary of the Interior has more power and more material interests under his direct control than any other member of the Cabinet. He is at the head of the Land Office, which controls all of the public domain. He is the head of the Patent Office, and of the Pension Office, dispensing more than a hundred and a half millions a year. He has charge of all the Indian lands and Indians. The vast reclamation service and irrigation service are under him. He is the head of the Geological Survey and of the Bureau of Education.

The right man in the Interior Department is invaluable to the future as well as to the present of the country. The wrong man can easily do irreparable damage. Secretary Ballinger comes to the office better posted and prepared for the work than the average Cabinet officer could possibly be. He knows the West from boyhood. He knows in advance the powers and possibilities of the office he holds. He is able and full of energy.

WASHINGTON, D. C.

The Lesson

BY RUTH STERRY

A ROBIN swung in the branches
Of the blossoming apple tree,
While I wept like rain for a bauble vain
And what could never be.
This is what he told me,
At least so I believe—
"Better sing today if the skies are gray,
You have time and to spare to grieve."

When next he swung in the branches
Of the blossoming apple tree,
I matched his note from my own glad throat
As true as true could be.
This is what I told him,
"Your message I believe,
And I'll sing today if my skies are gray,
I have time and to spare to grieve."
ROSELLE PARK, N. J.

Why Do Not Educated Women Marry ?

BY AN UNWILLING CELIBATE

SOCIOLOGISTS and political economists, presidents, college and otherwise, scientists of all sorts, and just common folk are employing much gray matter and many winged words in contemplating the question asked above. Why does the educated woman put afar from herself the traditional life of her sex, and, instead of handing on her own highly perfected type, leave the opportunities of motherhood to the less advanced? She is told that in refusing to marry she is guilty of disloyalty to her country, and doing an irreparable injury to society as well as to herself. She is shirking a manifest duty to the race, which has need of its most capable women to bear and rear the future generation. Potent words, these, and if they be true, well worth the consideration of those to whom directed. One does not like to be told that one is a coward, or that one is really and essentially a failure in life, especially if one has a notion that the accusations are based on a generalization that access to the facts would disprove. Women do not like to own up to the fact that their failure in their "women's business" is real, and not apparent merely. They prefer to say with gentle mystery, "It seemed best, my dear," or some such ambiguous remark.

Of course, one answer to the question is: But they do! Long lines of college statistics can be cited to show that educated women do marry, and uncommonly well and successfully at that, but, as a well-known sociologist said lately, "It's an awful comment on our civilization to see so many fine women unappropriated."

That is the real crux of the matter, not that so many educated women are married, but that so many of them are not. Even if we are so advanced as to believe that there are some women who ought not to marry at all, for the best good of the race, it would be a hardy person who would draw the line at the possession of an education, even in jest

or pessimism. For there is a truth, recognized by any one who has lived in a community where there are many women of this class, that there are many of them unmarried, and also of the type that gives rise to the frequent comment, "Why isn't Miss Blank married?" Very few are wise enough to see that the reason lies where the sociologist I mentioned pointed, that, since the custom of our society is such that unless a woman is lucky enough to find a man willing to "propose" marriage must remain to her wholly an abstract, academic question. I hold no brief for a change in this matter, tho, like most who are acquainted with modern biology, I opine that a greater freedom of initiative on the part of the human female would likely be of advantage to the race. The question I would discuss—my quarrel—is with those who would place upon the woman's shoulders the entire blame for the low marriage rate among educated (by that term such writers always mean college-bred) women. I have heard men say—and I presume they at least partly believed what they said—that the matter rested wholly with a woman, that a man was as wax in her hands. I asked one once—to test the reality of his belief in his words—if that was the way his sister did it, and the instant honest reply came: "She isn't that kind." Nor are most nice women, to which class college women belong, both by birth, in many instances, and by training, in others. Novels of the fast set portray a certain huntress type of woman, but she is not so commonly met with outside. The traditions of all the centuries have more strength than that. But to demonstrate my point would, I know, be difficult, because the data are wanting, so I shall make my own data, and be frankly egotistical, even conceited, if you please, for in such a matter, I take it, it is useless unless one speaks with authority, and not as the scribes. It seems to me that the worth

of what I have to say, if it has any, arises chiefly from the testimony of the first person singular. And I may add that, being a woman of pride, the facts here stated are known to none even of my most intimate. A woman does not willingly confess such failure in what the world regards as analogous to the infamy of the man who cannot support his family. Naturally I cannot speak with equal certainty of others, yet I am fairly sure that I am not a solitary exception in all the world, for I believe the essential truths I shall tell apply with accuracy to many women, among whom are any of a half dozen whom I know intimately.

First, then, I am a college graduate of a large coeducational university. I have also done graduate work in history and in sociology. I have taught some years, and I have earned money by my pen. I have met with fair success in both lines, and have met with some praise for my ability in my special field. So much for the contents of my brain cells.

Second, I am perilously near the danger line of thirty, so near that my family call me an old maid in their moments of greatest intimacy, and say, with a sense of humor wofully lacking, that marriage is hereditary in our family. They invent amiable and quite ingenuous tales about the suitors who languished in my disdain, for the benefit of friends and more distant relatives. My mother impresses it firmly upon me that anything is better than a single estate, and my brother tells me that after twenty-five a woman should say, "Good Lord, any man." I do not think they have the faintest idea of the truth; I hope not.

The first question any one asks about a woman past the "average age of marriage" is: "What does she look like?" We firmly believe in the Darwinian theory of attraction, in the face of all facts! However, I do not think I am either a "freak" or a "pill" in appearance. I am neither tall nor short, thin nor fat, nor am I cross-eyed. I am undeniably no beauty, yet I have received some compliments on my good looks, and I cannot confess to any particular defects. Women and men alike usually praise my skill in dress.

I come of an honorable family, of people who have done their share in the

world's work. I was brought up to liberal views, both in religious and social matters, and among people of education and culture. Naturally, also, I was brought up on somewhat "old-fashioned" lines as to destiny and training of a woman. I can "keep house" and cook nearly as well as my mother—and that's saying a good deal for myself, too—and I can sew and mend somewhat better now, as that part of the domestic economy was early turned over to my strong eyesight. Moreover, I like "keeping house." Even washing dishes does not seem to arouse the emotions within me that are aroused in some women! Perhaps it is because I am stronger than the average woman, or because of a violent liking to do things myself that are connected with keeping things clean. When it comes to the accomplishments, I must confess myself weak. I can make a fairly acceptable hand at bridge, but I don't really like it, or any card game. I can't embroider much—or I won't—and my musical ability is mostly in liking to go to good music, or hear some one else perform. I was guilty once of thinking I could sing, and perpetrated myself in a church choir, but I recovered quickly. I can draw a straight line, and I can drive a nail by the end of the hammer, but there end my artistic abilities! I am extremely fond of out-of-doors life, tramping, boating, riding, canoeing, botanizing, etc. I don't believe I know what fear means, in the sense supposed to be feminine, as neither mouse, snake, nor angle-worm has yet succeeded in making me perform an impromptu war-dance. My other chiefest unfeminine characteristic is a dislike to be waited on. I don't think that I am any more selfish than most people, tho of course opinions differ. All unmarried women of my age meet some time or other the frankly expressed judgment of some one about the general selfishness of their mode of life. I have one friend who reminds me of what she calls the painful fact that I fail of getting some of the things done that I want, because I am too good-natured and yield to too many demands on my time. Still, that doesn't really tell, and I may be very selfish. I have enough temper to keep me from standing too much imposition, I hope. In my own

mind, my besetting sin is a tendency to go into my shell if I feel a person does not like me. My efforts to be aggressive and masterful must have made the angels laugh, if they took the trouble to watch them. I wasn't cut out for that game.

Because I am still Miss ——— does not mean I have never enjoyed the companionship of men. Quite the contrary. I have traveled enough in leisurely fashion to have seen a good deal of people and places, and frankly think I have probably seen more of a varied social life than most girls. I have never found my student life a bar to enjoying a good time, to dance, or share in any of the usual amusements of young people. Indeed I have a memory very well stocked with jolly good times. I am by no means a recluse, for I don't believe that sort of thing pays, and anyway I don't like the job! A sarcastic friend of mine once said she didn't believe I could exist without a man to talk to. Of course I said I could, and tried it for six months. She won.

As to marriage, in the abstract, I have not the slightest objection, *per se*. I have known a good many men whom I am sure would make excellent husbands. As a young girl, my happiest and most frequent dream was of the nest to be mine some day. The possibility of my present existence never occurred to me. I've given up dreaming such things now, but the renunciation has not been easy. I "fell in love" once, and I have always been very glad it came to me, even if that were all. Once, when I was quite a young girl, I had an offer of marriage from a man very much older than myself. I really wasn't old enough to know whether I cared for him or not, and as my family did not approve, I refused him. I know now how much the wisest course that was. It is my only experience of marriage considered in the concrete.

This is my problem: Given a woman of average good appearance, well brought up, well educated, "attractive to men" (if one may judge by appearances), with training and desire for the "normal life of a wife and mother," why is she, at my age, not merely unwed, but unwooed? Other girls, whose ideals and ignorances

have sometimes shocked me into wondering what sort of a home could be created by such means, are married, and to fine men. I am a "confirmed old maid," and must find outlet for my maternal instincts in tiding my married friends over domestic crises, or helping some of my former students out of their difficulties. And I aver that my maiden condition is thru no fault of mine that the most searching self-examination can discover. I still know sundry men. I am still asked to go to dances, theaters, picnics, canoeing, and even on moonlight walks, when I am generally regaled by confidences anent my escort's love for Polly Jones. These are pleasant friendships, and I am by no means envious of Polly Jones, for I prize the trust reposed in me very highly, and the sense of comradeship, even of the elder-sisterly relationship it implies, is very dear to me. Without this I should be very lonely, for I am not the type of woman who can be happy with only the companionship of her own sex, nor can I find solace in books or strenuous work for the lack of intercourse with my kind. Man was not made to live alone, nor woman either. But when men tell me of their dreams, their aspirations, demand my sympathy for their rebuffs and injustices, I am proud of their trust and confidence, yet I cry out against the essential impersonality of it all, as if I were a sort of embodiment of the Earth-Mother, with only the extra advantage that I can reply, and give them the encouragement and comfort they want.

Why? I read in a sociological journal the other day a quotation from some student of social problems that a woman in whom the maternal instinct is strong is not likely to be "attractive to men." In the most of my unmarried friends the chiefest regret they seem to have, in many cases the only one they ever express, is the regret at missing motherhood. And this is the logical outcome of their ideas when we were all girls together. It is not *ex post facto*. Other sage and sophisticated persons say a woman must never let a man guess she has any brains, or knows how to talk anything but utter nonsense. They say that a woman must show an utter dependence upon a man to make him wish to marry

her, in order to flatter his sense of superiority. That never appealed to me as a square deal to a man, even if I'd been made so I could! As a matter of fact, perhaps the most frequent speech I have heard from a man has been: "It's such a comfort to find a woman who doesn't want to talk nonsense all the time." But then, men are deceivers ever, and perhaps they didn't really mean what they said. Yet why did they come to see me, then?

When I look around at the homes, the pitiful, inadequate makeshifts that are

called such, and when I read the record of the divorce courts, and I then look at my unmarried friends, I wonder if marriage is really "a process of natural selection," and invariably results in the mating of the fittest.

But the one thing I am sure of: The fact that some women who are by all outward tests the ones best fitted to perpetuate the race are not doing so is not their fault but their misfortune. They have been judged by some other standard, and they have not had the chance.

ASTURA.

The Latin Shore

BY DR. THOMAS ASHBY

DIRECTOR OF THE ENGLISH ARCHAEOLOGICAL SCHOOLS AT ROME

ONE of the most remarkable facts about modern Rome is, that tho it is within about fifteen miles of the sea in a direct line, the distance might as well be fifteen hundred for all the practical difference that it makes to the daily life of either rich or poor. There is only one point within the city from which the sea is visible, and that is the dome of St. Peter's, a sight to which many have ascended once in their lives, and, probably, very few a second time. Communications are few, and the nearest points of resort on the sea coast for the sea bathing in the summer, Ladispoli and Anzio, lie at a far greater distance from Rome, quite thirty miles west and south, respectively, than one would be inclined to believe.

Nor is the neighborhood of Rome to the sea made use of commercially. The Tiber, owing to the difficulty of entering its navigable arm—of which more will be said later—and the tortuousness of its channel, is only used by ships of quite small burden. A project has for several years been before the public for the construction of a ship canal from the coast on the left bank of the Tiber to Rome, it being proposed that the docks should be placed in the neighborhood of the Church of St. Paul and outside the walls. The technical difficulties to be overcome are comparatively small, inasmuch as there is no question of the crossing of any mountain range, the Tiber valley being sufficiently wide to admit of the passage of

the canal without necessitating any cuttings in the hills on either side; and, as at the point near St. Paul's, where it is proposed to place the docks, the ground level is only forty feet above sea, the construction of the canal is obviously mere child's play in comparison with what has been and is being done elsewhere; and the only technical difficulty is likely to come from the washing of the large amount of solid matter which the Tiber brings down into the mouth of the canal.

for it channels into which it may flow. Whether those who love Rome for its associations with the past, and for the abundance of the remains of that past, those who value the unique charm of its desolate Campagna, where one may wander at will for miles and hardly see a living soul, and pass unquestioned over hill and dale, whether those who come for archeological or artistic studies will welcome the change, may be doubted. But there is to me no doubt that, since the

WAREHOUSES AND TEMPLE, OSTIA

The commercial advantages are obvious, and to those who are afraid of the project as being not likely to produce sufficient return on the outlay, reply may be made that one of the chief faults of modern Italy has been a strange inability to see that the way to develop trade is not to wait until it imperiously demands necessary facilities—and sometimes, alas! for lack of them in Italy is inevitably diverted elsewhere—but to risk something in capital expenditure in advance, and prepare

discovery of the true cause of the malaria which has made the Campagna at Rome, and not least its low-lying coast line, an unhealthy desert for centuries, and the demonstration that by the taking of proper precautions it is possible to live in these hitherto abandoned districts and escape this dreaded scourge, there remains no reason against the economic regeneration of the environs of the great city, the continual growth of which will provide an ever increasing market for

what they are capable of producing; and, unless the calculations of the engineers who are the promoters of the scheme, *Pro Roma Marittima*, as it is called, are entirely mistaken (and, though possessed of no technical knowledge of my own, I know of no reason why I should not accept them as correct), the timidity and hesitation with which the suggestion has been met cannot be regarded as justifiable.

Let us see what was the case in Roman days. We find at once that certain errors were committed from which the present day may take warning. The original harbor of Rome, at Ostia, had become dangerous in the time of Augustus, as Strabo tells us, owing to the silt brought down by the Tiber, and ships had to run the risk of anchoring in the roads, their cargoes being in part transferred to lighters before they were able to enter the river.

Claudius constructed a new harbor on the right bank, which, however, was not very safe—even after his time we hear of two hundred ships being destroyed in the harbor itself by a storm—which he

connected with the Tiber by a canal, thus creating the island (*Isola Sacra*, the name first occurs in Procopius) at its mouth. An important town arose round the docks and became the see of a bishop at a very early date in the history of the Church (314 A. D.). Trajan built a more secure harbor inland of that of Claudius, which was also connected with the Tiber. Indeed, the canal bears the name *Fossa Trajana*, tho the name is not older than the beginning of last century and is not altogether correct. It is this canal that still serves as the entrance to the river for the small craft that are able to reach Rome; others of them remain at Fiumicino and there discharge cargo. For since Roman days the coast line at both mouths of the Tiber has advanced nearly two miles, so that the island has become far larger and the canal far longer. The rate of advance, indeed, has become considerably more rapid during the last few years, so that the tower erected at Fiumicino close to the sea in 1773 is now about half a mile from the extremity of the jetties which protect the entrance; and owing to the

DRAINAGE CANAL, CASTEL FUSANO

smallness of the tide (about one foot) which prevails in the Mediterranean, a bar forms in front of this entrance which renders it difficult of access in any but the calmest weather. This advance has, for some reason, probably the fact that the prevailing winds are southeast, been far greater on the right than on the left of the mouth of the Tiber, so that the harbor of Claudius was wrongly placed by the marine engineers of his day. Guided by that experience, the promoters of the proposed ship canal would make its entrance correspond with the present outlet of the water pumped from the marshes of Ostia, some four miles to the south-east of the mouth of the Tiber.

Having discussed the question of the harbor of Rome in ancient and modern times, let us now proceed to consider the condition of the coast at these different periods. It may be said roughly that the influence of the solid material brought down by the Tiber upon the coast line extends as far to the north northwest almost as Palo, which corresponds to the site of the ancient Alsium, where, among others, Pompey the Great possessed a seaside villa, and which in ancient times belonged, as did the whole of the territory on the right bank of the Tiber, to Etruria, tho now the province of Rome runs much further up the coast. The place is now only a small village, with a castle of the Odescalchi family on the promontory, and the low, sandy shore, with its tideless sea, is not as attractive to us as it seems to have been to the ancients, many of whose residences can be traced, now in ruins, along it. From Palo to Porto is a distance of some twenty miles or rather more—a not unattractive day's walk. The low coast is guarded by towers at intervals, dating from the sixteenth century for the most part—that of Palidoro, erected by the Hospital of S. Spirito in Rome, to whom the land belonged, in 1562, is shown in the cut. Further south, as has been said, the Roman coast line, marked by a low line of sand hills, recedes further and further inland; and on this stretch, at any rate, the ruins are less plentiful, tho the accumulation of sand and the growth of scrub have done much to conceal what there may have been. After a time we reach Maccarese, with its beautiful pine

forests, often the resort of artists, and a few miles more, first thru wood and then thru open country, bring us to the site of the harbor of Claudius, the breakwaters of which, now covered by sand hills, can still be recognized. But the remains of Trajan's harbor, with its hexagonal basin, now the home of waterfowl, and ruins of the warehouses and other buildings which surrounded it, are far more considerable. The so-called Arco di Nostra Donna is a part of the fortifications by which it was protected on the land side from a *coup de main*, by Septimius Severus or by Constantine, which, on a low coast like this, might not have been very difficult.

Of the island formed, it would appear, by Claudius, we have already spoken. To the south side of it runs the main stream of the Tiber. Until 1557 it ran close by the walls of the Castle of Ostia, a fine specimen of Renaissance fortification, and only lately correctly attributed to its real author, Baccio Pontelli, by whom it was constructed for Cardinal Giuliano della Rovere, afterward Pope Julius II, in 1483-86. But in 1557 a great flood changed the course of the river, and the castle and village of Ostia remained nearly half a mile distant from it, the old bed (called Fiume Morto, or Dead River) remaining as a fertile source of malaria up till the present day. It is now to be filled up with the débris from the continuation of the excavations of the Roman city of Ostia, and thus one of the chief feeding places of the *anopheles* mosquito will be gone. The effect of the discovery that the bite of this insect was the cause of malaria has already been of great, and will in time be of incalculable benefit. It is probable, as was demonstrated by the English doctors who made the experiment at Castle Fusano, near Ostia, to live without taking fever in what have hitherto been considered the most unhealthy districts, if only the mosquitos are excluded by fine wire netting from the houses, and if the inhabitants take care to be within doors at night. The prosecution of the excavations will be very welcome also to archeologists. The discoveries made up to the present have been of such great interest that their suspension, which has now lasted for some years, has been a matter of general re-

gret. The ruins that we see belong to an important commercial town of the imperial period. The view shows one of the principal streets leading between rows of warehouses to the principal temple of the city, a lofty brick building, generally supposed to have been dedicated to Vulcan. Other buildings of interest are the theater, the forum upon which it fronted, a shrine of Mithras, etc.

Both Porto and Ostia are accessible by roads—one on each bank of the Tiber—

ist, but the intervening links have in the main disappeared, or are only faintly traceable. The coast line has advanced all the way between Ostia and Tor Paterno—less than on the north of the Tiber mouth, but still considerably—and the villas now lie half a mile from the sea, separated from it by lofty sand dunes, which conceal it from view. The solitude is oppressive almost, and one contrasts it with the life and gaiety which once prevailed. Pliny the younger had a villa here, of which he gives in one of his letters a long and enthusiastic description. The works of art which are from time to time brought to light by excavation (*e. g.*, near Tor Paterno a fine replica of the Discobolus of Myron, given

TORRE FOGLIANO.

TORRE PALIDORO.

direct from Rome, and the former by rail also; while from the latter the road has recently been prolonged to the seashore, where a bathing establishment, approached by an electric railway direct from Rome, is projected. But both the coast between Palo and Porto on the north, and that between Ostia and Anzio, or even Terracina, on the south, are comparatively difficult of access. This was, as we have hinted, not the case in Roman times, and that especially to the south of Ostia was much frequented. Along its whole length almost was an uninterrupted line of villas facing upon the sea, and behind them ran the high road, rebuilt by Severus and bearing his name. It was connected with the capital by a network of roads, the main lines of which—to Tor Paterno, to Pratica, to Ardea, to Anzio, to Terracina—still ex-

by the King of Italy to the Museo delle Terme) enable us to judge of the splendor of these seaside residences. Inland, it is true, there must have been forests even in Roman times, for we hear of the imperial elephants being kept hereabouts. All this first stretch of coast forms a part of the estate which is now in the possession of the King, and the covers are the haunts of wild boars and game. Further on the large trees disappear, and the scrub becomes lower and thicker. At Tor Paterno (a farmhouse built into a large Roman building, possibly an imperial villa) a road comes

down from Rome, passing the royal hunting lodge at Castel Porziano; and here was probably the site of the ancient Laurentum, the home of the native King Latinus, whose daughter, Lavinia, Æneas

of its unhealthiness, and hardly more prosperous now. It, too, is approached from Rome by a direct road, which passes thru what is perhaps the most desolate region of the desolate Cam-

ARCO DI NOSTRA DONNA, PORTO

married, and founded a new town, Lavinium, some way off, and about two and one-half miles from the coast, in a healthy situation—for it lay some three hundred feet above the sea—and, under the name of Pratica, is still inhabited. From Tor Paterno onward the Tiber ceases to have any influence upon the coast, and its line is identical with what it was in Roman days; but it still continues to be low and desolate. We soon pass the mouth of the Numicus, that river of Latium in which Æneas was drowned. Not far up its course is Ardea, the capital of his adversary, Turnus, King of the Rutuli, standing upon an isolated rock, with strong and still well preserved fortifications, but almost abandoned even in later Roman days because

pagna. A charm of its own, however, all this district indubitably has—undefinable, it may be, and certainly such as to some nations and some individuals will make no appeal; but its vastness, as an Italian friend well said to me, makes it a worthy approach to the great city which lies in its midst, and no one can fail to be struck by the contrast between the desolation of the present and the vigorous life of the past—a life which, as I have said, may well spring up again ere very many years are over. As it is, thousands and tens of thousands of her best workers leave Italy, and she makes but little effort to keep them, when, if she would but realize it, she has both need of them and work to give them.

But let us continue our survey of the

Latin coast. Beyond the mouth of the Numicus the shore grows somewhat higher, and at the end of a line of sandy cliffs we come to Anzio, an old Volscian town, once the foe of Rome. In one of her first naval victories Rome took from the prows of the conquered ships of Antium the sharp beaks (*rostra*) and made use of them to decorate the front of the platform from which her orators spoke. The old Volscian town lay a little inland, but in Roman days the whole shore was covered with seaside residences, and the place has several villas of the present-day Romans and is connected with Rome by a railway, being especially resorted to in the bathing season. Here was a famous temple of Venus and a harbor built by Nero; the modern port, placed differently by the Papal engineers, tends rather to become silted up (for here, contrary to what was the case at Porto, the Romans knew better than their descendants), but serves for small sailing and fishing boats, and the view of the port is very picturesque, with the graceful lateen sails, furled by small boys who climb along the booms with the agility of monkeys. The view, too, is far more striking than it has been along the coast we have hitherto been following. Across the bay, in which lies Nettuno, with its castle, and the artillery camp near by, we see in the distance the great promontory of Circe, and nearer to it the lonely tower of Astura. Here was once an enormous Roman villa, now half submerged, but so that its plan may still be traced in calm weather, with a tiny harbor of its own; and in the castle Conradin of Swabia sought refuge in 1268, but was treacherously murdered by Jacopo Frangipane. Astura in Roman days was a seaside resort upon the coast road, but not, it would seem, very healthy. Cicero owned, it is true, a favorite villa here, to which he withdrew after the death of his well-loved daughter Tullia; but both Augustus and Tiberius are said to have contracted here the illnesses which proved fatal to them.

From Astura a single sweep of coast sandy, low, and followed for the greater part by lagoons, runs to the foot of the Monte Circeo. The coast is guarded by two solitary towers, again of the six-

teenth century, bearing the names of Foce Verde and Fogliano, of the latter of which a view is given. The coast road probably passed inland of the lagoons, and along the narrow shore strip there are hardly any traces of Roman life. At Fogliano, however, there are ruins both close to the tower and upon the actual site of the villa of the Duke of Sermoneta, whose property stretches inland from here as far as the Via Appia and Cisterna, with enormous extents of forest and pasture, the former predominating near the coast. Not far inland is a line of sand dunes—a prehistoric coast line, perhaps—rising as much as 60 or 70 feet above sea level, and which, with a similar line of dunes between Monte Circeo and Terracina, has been the cause of the continual difficulty of draining the Pomptine Marshes, parts of which, tho at a considerable distance from the coast, are hardly above sea level. There still exists an old channel, possibly of Roman date, the Rio Martino, which in process of time became entirely choked up.

The lagoon just to the north of the promontory of Circe is called Lago di Paola. It abounds with fish, and on its eastern shore are the extensive remains of a Roman town of the second century of the empire, with quays or esplanades upon the shores of the lagoon, commanding a lovely view of the great promontory. The large cisterns for fresh water are especially noteworthy for their size and excellent preservation.

This was the Roman town of Circeii of the imperial period, a mere seaside resort. But the older town, whether it was founded by the Romans, who established a colony there, probably early in the fourth century B. C., or whether it had a previous existence, occupied, there seems to be no doubt, the site of the modern village of S. Felice, at the eastern extremity of the promontory, and possessed a citadel upon the ridge of the promontory itself. Both the lower town and the citadel were enclosed by walls of "Cyclopean" masonry, those of the latter being well cut and jointed on the outside, but less carefully worked on the inside.

From any point on the ridge, which

runs from west to east, the view is superb. Looking inward over the immense expanse of the Campagna and the Pomptine Marshes, one sees sometimes, it is said, the dome of S. Peter's, and always the Alban and Volscian hills; looking southeast is Terracina at the end of a beautifully curving low shore, and beyond it the rocky coast going toward Gaeta, and Ischia beyond; looking south, out to the open sea, are the islets of the Ponza group, looking most attractive to inhabit, and, by a strange irony, it seems, selected as penal settlements. No wonder that this solitary mass of limestone, rising as it seems out of nothing to a height of over 1,500 feet, and dominating the

whole of the Pomptine Marshes and the southern part of the Latin shore, should have excited the imagination of the ancients, so that the legend of the enchantress Circe localized itself in what looked from a distance like an enchanted island, and is, in fact, one of the loveliest spots in Italy.

There let our survey of the Latin shore end. Terracina, ten miles across the bay, in full sight, is the point where the Via Appia reaches the coast, after its long, straight course thru the marshes, and then enters a difficult pass, the natural boundary between the center and the south upon the coast, and the end of the district with which we have been dealing.

ROME, ITALY.

Apple-Seed and Apple-Thorn

BY M. M. STEARNS

"ONE I love, two I love, three I love, I say"—

Arbutus and violets—children out at play;

"Four I love with all my heart, and five I cast away!"

Sweet wine and sour wine, seasons good and bad—

Here's a little maid at work, and there a little lad;

Read you me my riddles, and I'll say you why you're sad.

Daisies and buttercups—sunshine after rain—

Was it four that brought me pleasure, or five that caused the pain?

"Two I love, and three I love"—and, "One I love" again.

"Four I love with all my heart, five I cast away"—

Men and women toiling still—meadows sweet with hay;

Answer me my questions, and I'll prove you that you're gay.

Striving here, and thriving here, there a little gain,

Here a little sorrow where a little joy has lain.

Was the hurt akin to pleasure—or the pleasure three parts pain?

Fire-weed and golden-rod—dark heads growing gray—

Here's a passing Summer, and a life-time, in a day.

And it's "Four I love with all my heart, five I cast away!"

Strong years, and wrong years—maples turning fast;

Pain and pleasure blending in the gloaming, at the last.

Would you mar the seasons' score? Or grudge a sorrow past?

Aster and bitter-sweet—Winter drawing near;

Feet upon the fender in the Autumn of the year.

Was Summer, then, so beautiful? Or Winter, is it drear?

"Four I love with all my heart, five I cast away"—

Joy of life—flakes of snow—memories at play;

"One I love, and two I love, and three I love, I say."

LOS ANGELES, CAL.

Growth of Greater New York

BY THOMAS W. HOTCHKISS

[As secretary of the Association for New York, Mr. Hotchkiss is well qualified to write on this subject.—EDITOR.]

IT was generally stated in the newspapers during the Hudson-Fulton celebration that New York City entertained 2,000,000 "visitors within her gates." If that is so, the population of New York at that time amounted to within 1,000,000 of that of Greater London which is still the largest city in the world.

Let us compare the estimated population for 1909 of the six largest cities in the world. These are:

Greater London	7,452,986
Greater New York	4,564,792
Paris	2,702,088
Chicago	2,224,490
Berlin	2,164,944
Vienna	2,100,350

These figures are estimated by taking the census population of each city for two different years, striking a difference, and thereby obtaining an average annual increase in population. This average annual increase is then multiplied by the number of years which have elapsed since the last census taken for that city, and the product is, of course, the population for 1909.

The original sources of information for the census statistics are such recent publications as the United States Census

Report (1900), Lippincott's Gazetteer (1906), Nelson's Encyclopedia (1907), Brooklyn Daily Eagle Almanac (1909), and the New York Department of Health's official estimate (1909). The leading fact thus deduced is that the rate of annual increase in population of Greater New York is much more than that of any of the six most populous cities of the world. This schedule of annual increases is as follows:

Greater London	109,046
Greater New York	125,287
Paris	9,805
Chicago	58,435
Berlin	31,190
Vienna	50,222

So, while London outmeasures New York in actual population, New York outstrips its larger rival in its speed of increase. At this rate it would be easy to estimate the exact number of years it would take New York to equal the population of London and to beat her in the race of numerical magnitude.

These figures are furnished by the Association for New York, the recently organized society which has for its object, as stated in its charter, "To contend for the principle of the government of

New York by New Yorkers, for New York, to challenge indiscriminate abuse and criticism of New York City, and to set forth her advantages as a place of residence for the citizen, as a point of production and distribution for the manufacturer, and as a mart for the merchant." This is the association which has erected in Times Square the temporary statue emblematic of the strength and magnitude of Greater New York, and her repulse of indiscriminate abuse of her municipal government. The statue is not primarily for political purposes, but has been unveiled at this time, as Mr. William Harman Black, its managing director, states, because during the municipal campaign it may be expected that mud-slinging will begin. The Association points out that much harm has been done to the city's credit and to its manufacturing and commercial interests by wrong impressions going forth regarding the uses made of the taxpayers' money.

It is well, no doubt, from time to time to pause in the rush of our daily life in a busy metropolis like New York, and to consider exactly what the city is accomplishing, how we stand as compared with other cities of the United States and of the world at large, and to take a fair and just estimate of all our material advantages and development.

No more definite index of a city's prosperity could exist than the increase in her population. While New York starts with a superb harbor—no doubt the finest in the world, where the largest ships can unload passengers and cargo alongside their piers—and while New York inherits a commercial spirit from the early Dutch and English settlers who came here for no other purpose than to engage in trade, it is undoubtedly the manner in which business has been con-

ducted, and buildings, subways, bridges and other great municipal structures erected, which have brought people to New York as the great center of progress and prosperity of the Western world. We can, perhaps, more definitely shape our concepts of New York's immensity by comparing her population with that of some of the States and Territories.

According to the last United States census, taken in 1900, there were then only three other States in the Union, outside of our own State, which were larger in population than the City of New York. These were:

Pennsylvania	6,302,115
Illinois	4,821,550
Ohio	4,157,545

New York State that year had 7,268,894 inhabitants, and the City of Greater New York 3,437,202.

It will be interesting to make a similar comparison when the census is taken for 1910. The population of the city has increased 287.90 per cent. since 1860, while the population of the United States has increased 102.90 per cent. since 1858. In 1905 the city's population was half that of the State of New York, with an increasing proportion in the city's favor, the figures then being, according to the New York State census: The State, 8,067,308; the city, 4,013,781.

There will be much of interest to study in the census of 1910, in view of the vast development of New York City in the last ten years. The consolidation provided under the Greater New York charter became effective January 1, 1898. The census of 1900 was taken soon after, and the census of next year will therefore be the first on which to base any comparative statement of local conditions.

NEW YORK CITY.

How Hardly Shall a Rich Man

BY BOLTON HALL

THE Kingdom of Hell is like a wealthy boy who wished to cut a fishing rod for himself, so as to catch the minnows, but he was prevented lest he should wound his hands, because

he was a millionaire's baby. But his father bought him a costly fishing rod.

Again, he wanted to feed the Elephant, which was considered too menial for so rich a child, but instead he could only

subscribe to the Zoological Garden Fund. The Elephant was only "an Individual Case."

When the boy grew older he wished to work at something useful, but his papa said it was not necessary, and that he should Enjoy Life. So his papa gave

him money, and bought him an automobile, and started him on the road.

The road was smooth and down grade all the way.

His father did not know that the road led down to Hell.

NEW YORK CITY.

Up the River

BY HARRY H. KEMP

LYING here on the sand, quite naked, under the sun,
I feel as if the sky, and the earth, and myself, were one;
No more the dividual heartache turns like a knife in my breast.
But I swim into infinite spaces where the infinite soul is at rest.

An express train sweeps round the curve with a many-wheeled murmur of sound,
And its volume of billowy smoke strikes backward like hair unbound,
And out on a tawny sand-bar five shining-bodied boys
Run, splash, wrestle, and shout, and revel in water and noise.

Behind me lies the city . . . I can tell just where by the smoke
Which hovers above its house-roofs and wraps the sun in its cloak.
There men are striving and fighting, but here the world is at peace.
And the trees are cool and the clouds unravel the whitest of fleece.

But sudden I see a wood-dove go down 'neath the pounce of a hawk
I remember the snake I chanced on, mangled, beside a rock,
And I notice the minnows scurry to escape some invisible foe
As I dress at the lip of the river . . . And the fact of things, like a blow,
Strikes me full in the soul . . . And beneath the green of the leaf,
The song of the bird, I catch a hint of battle and grief,
A cry as of struggling spirit sweating with blood toward God,
'Neath the mystery of pain which wounds but heals with its rod.

The west was all a-quiver with ebbing ripples of light
As a quick mood came and and whispered, "Come, let us give up the fight."
But I answered, "No, I cannot; for the strife is not only there,
In the people-huddled city, but it rages everywhere.
It rages on star and planet, it spurs to battle life's least—
And dare I crave exemption, and still seek place at the feast?"
So I hastened back to the city as at a master's command . . .
I had seen creation at travail as I lay on my back in the sand!

LAWRENCE, KAN.

Literature

Martin Eden

JACK LONDON's new novel* purports to be the biography of one Martin Eden, but we are given to understand it is really the autobiography of the author himself. However, an autobiography is not nearly so truthful as a biography, because the author has always got his own beam in his eye. He writes too eloquently of how he felt and changes too much of what he actually did. A man may shine, autobiographically speaking, as great and good, and yet have a very commonplace life record, which falls far behind his autoidealization. For that reason it seems best to accept this story not as real history, but as an earnest and truthful record of what Mr. London might have been if he had been Martin Eden instead of being limited by himself.

The scenes are laid in and about Oakland, Cal. Martin Eden, a young sailor, defends Arthur Morse, a university student, in a free-for-all ferry fight. As an expression of gratitude, he is invited to the Morse home for dinner. And it is upon this occasion that he meets Ruth Morse, a frail jonquil woman, with topaz eyes and yellow hair, which produce the impression of inner angelhood upon the young sailor. It is perfectly clear to the reader, and even to every other character in the story, that she is only a "female thing," not yet conscious of her gender, with a lexicon for a mind and a very small, bickering English grammar for a soul. But some men require a very strong illusion in which to orient themselves—the less perfect the thing the greater the joy of idealization. Once Martin belonged to this class. He was a young man made of aboriginal giant dust dredged somewhere out of the bottom of stormy seas, and the contrast between Ruth and the young jennies of his own class produced that spiritual alchemy which we call illusion. He is immediately in love with her and mastered by the desire to "reach" her in the scale of

things. This baptized ambition changes the very scenes of his nature. He determines to fit himself to become her mate. And upon this follows the most remarkable account of an honest young brute's effort to become something better and different thru education. It is a mighty, big-necked, muscular struggle to acquire knowledge at once. The sailor sweat stands out on him in the public library as he grapples with Darwin, Haeckel and Spencer. And they who have the intelligence to understand will appreciate the pathos of this Promethean struggle. Martin begins to show a sort of horrid beauty of the spirit, new and different from the thin, formalized prettiness of spirituality with which we are so tiresomely acquainted. We do not like it, we do not approve it, but we must acknowledge the impressiveness of an aboriginal man trying to make a soul of his own without any god's help. He is not long in finding his particular cue to the life and mystery of things. Biology becomes his Old and New Testament. Herbert Spencer his Moses, and to all this he adds the personal pantheism of Walt Whitman. "Sometimes," he exclaims to Ruth with the egregiousness of the invincible egotist, "it seems to me that all the world, all life, everything, had taken up residence inside me and was clamoring for me to be spokesman." As a matter of fact, the self-made man, in the very nature of things, has less of life, of the world and of all things in him than the man who has been gradually created by them. He is too full of himself, of his own performance, of his one god-deed. Martin was to the end too ignorant to know that all he had assimilated as education was the beaten-biscuit thought of others who had prepared it long ago. His originality consisted of something else altogether—that is, the power to learn a great deal and to remain the same, literally the same. Few natures are so magnificently impervious to educational influences.

All this time Ruth's relation to him is that of a prim schoolma'am trying to guide a young bull, inspired by angels,

* MARTIN EDEN. By Jack London. New York: Macmillan Co. \$1.50.

thru society according to the rules of the best writers and speakers. For there can be no doubt that Martin was guarded and comforted by a new and perverse kind of angels, created by Herbert Spencer out of materialism, and by Martin himself out of the exuberance of his centaur imagination. By this time, however, he has discovered that he must write, and he goes at it with characteristic muscular vehemence. The next hundred pages contain the record of his struggles with editors, with the disapproval of Ruth, to whom he is now engaged, and with the lack of faith in him on all sides. And the account would be tragic but for his invincible egotism. Everything in him suffers but that. He starves, endures great hardships, performs prodigious tasks with his pen, but his ego brays and leaps to the last like a young, unbroken ass. It is superb, but it is not sad, not even when he is bright-eyed and hollow-checked from starvation. If any other kind of man had written such an account of privations it would excite sympathy, but as we read of Martin's agonies we only snicker at him and tremble for those purblind editors when he does get the biceps of his literary genius to play upon them.

It is time, also, for the bourgeoisie to begin to tremble. He has not achieved success yet, but he has found his point of view. It is at the big end of the horn, with the bourgeois at the little end. He finds that the socially and financially well-to-do are the meanest spirited, most cowardly and snobbish people in this world in their relations to any other man who desires to rise in the scale of things. The trouble is that Martin is afflicted with equal selfishness. He was anxious to escape from his own class into that of the bourgeois which he idealized. But when at last he arrived among them he discovered that the difference between them and him was an inner difference. Their manners and affectations and formulas of dried beliefs nauseated him. Their psychological cramps he regarded as frightful and incurable. But here is the point: He could no more endure his own class out of which he had risen than the bourgeois could at first endure him. Like all the iconoclastic spirits of his times, he desired to enter another class only to exploit it for his own benefit.

The obstinacy of human nature appears to be the only quality that every class holds in common. The socialist desires that all men shall become socialists in order that he and others like him may share their property. Martin demanded as much of Ruth as she did of him. She yielded the moment it was to her advantage to do so. He was ready to yield and become a bourgeois for the reward of her love, but when that was no longer desirable he refused to make concessions that would have been of no advantage to him. In this connection we ought to state that he is not a socialist, but an "individualist," which is the civilized name of "strongest brute." He holds with a devotion that is either insolent or courageous, according to the state of his own health, to the belief in the survival of the fittest, and with his prophet, Nietzsche, that the battle is to the strong and the race to the swift.

But the many immoralities of the book are partially atoned for when an author rises to the heights of proving the futility of his hero's philosophy, and presumably his own, as he does in the sequel of his story. Having gained what his ambition demanded in literary success, finding himself courted, rich and prosperous, Martin Eden discovers that he is sick unto death of life. He has worked through every illusion. The plant of hope has flowered and withered, the power to desire is gone. The last chapters read like an interlinear translation of Ecclesiastes in modern life. "All is vanity and vexation of spirit and there is no profit under the sun." But having reached this state of psychic degradation the old King exclaims that the conclusion of the whole matter is "to fear God and keep His commandments." And whatever one may say about effects upon consciousness of the half-evolved science of biology, the man who serves God and keeps His commandments at least keeps his ideals, his taste for living, his anticipations. But Martin Eden had not feared God. His commandments were fragments of Jewish mythology, and his conclusion of the whole matter was to commit suicide according to a suggestion offered by some lines in Swinburne. The awful veracity of an author who can produce such a logical and convincing argument against his own way of thinking

ought not to pass unpraised. There is a noble death in such truthfulness, and whatever the readers of this story may think of Mr. London's views of life, the passionless courage with which he sets down the failure of such views to satisfy the eternally human heart commands respect for him. Few saints, bourgeois or otherwise, could have accomplished it.

Biblical Criticism and Modern Thought

OLD TESTAMENT criticism has by no means completed its work, but the results in broad outline have been the property of scholars for some time, and now the task of reorganizing biblical study in accordance with these results is laid upon the shoulders of those who would see no diminution of regard for the time-honored book. And what a supreme task it is! The changes in point of view are far-reaching and fundamental, but they must be made if we are to see the Bible in the new light. Instead of the eternal thought of God miraculously given, we find a fragmentary literature, some of which appears to have been preserved quite accidentally. Where once we looked for verbally inspired messages to the individual soul we now seek for the evolution of the religious thought of a great people. We must leave behind the allegorical and personal interpretations so dear to our fathers and enter upon the study of historical and literary documents. Critical investigation now takes the place of trembling hesitation in the presence of the mysteries. And the book which was once supposed to be sufficiently clear to all except the commentator and theologian seems about to be closed to all but the scholar and antiquarian. It is no wonder that the average man hesitates to accept the new positions or that critical results make their way so slowly into popular thought. The difficulties, however great, are not insuperable, and the transition is already far advanced. Every contribution will be welcomed by the earnest workers in this field, but a great part of the burden of reconstructing popular thought along the new lines must be borne by the ministry, and this

book by Professor Jordan* is both a plea for such work and a guide to its accomplishment.

The main portion of the book consists of a course of lectures originally prepared for the Theological Alumni of Queen's University, and designed as a help to ministers in gaining the new viewpoint and utilizing its results in their work. The author maintains that no one can rightly understand or expound any passage in the Old Testament unless he has first formed a clear idea of the position which this great book holds in the history and literature of the world. Reverently and carefully Professor Jordan tries to set forth this position on the basis of the results of modern discovery and biblical criticism. He has no sympathy with those who feel that it is dangerous to question too closely sacred things, yet his attitude and method of approach are not calculated to outrage the feelings of those who still rest on positions that have lost their logical foundations. For he well knows that the "influence of a dogma is not destroyed when it is disproved; it may be true of men that when their brains are out they are dead, but dogmas continue to flit about a long time without any brains."

Over and over again he urges that if we are to understand the Old Testament we must accord it the same treatment given to other great literatures. Archeology, contemporary history and literary criticism all contribute to a proper background for interpretation. These the minister ought to study long and carefully, both for his own culture and as a preparation for his life's work; and if he has a real, scientific interest, his mental life may here find a deep satisfaction. There is an instructive chapter on the relation of criticism and archeology, and a note of warning is sounded against the foolish and misleading over emphasis of their disagreements, of which such men as Professor Sayce and Professor Hommel have been guilty. Altho the book is

*BIBLICAL CRITICISM AND MODERN THOUGHT, or The Place of the Old Testament Documents in the Life of Today. By H. E. Jordan, B.A., D.D., Professor of Hebrew and Old Testament Exegesis in Queen's University, Kingston, Canada. Author of "Psychic Ideas and Theology" and "The Pharisaic Gospel." New York: Charles Scribner's Sons. \$3.00 net.

somewhat discursive and loosely connected, it nevertheless has real value and will serve well a good cause in helping many to see how reasonable and how advantageous to the religious life the work of biblical criticism has been.

The City of the Dinner-Pail. By Jonathan T. Lincoln. Boston: Houghton-Mifflin Co. \$1.25.

The City of the Dinner Pail is Fall River, Mass., a typical New England mill town in which the author's business life has been passed. Sympathetically and eloquently he describes this work-a-day city, dominated by the big brick and stone factories that rise near the shore, straggling up the hillside from sea to stony crest, where stands the huge Catholic Church, symbol of the religious culture that softens the lives of many toilsome weavers. Idlers are few in Fall River, tho wealth is abundant. Employers and employees, the purchasers and sellers of labor power, have become separated and largely estranged as factories have grown, processes become more subdivided and relations impersonal. This separation, and the misunderstandings and hatreds that result, the author, like so many gentle employers of a decaying school, sorrowfully deploras. He recognizes the necessity and value of trade unions and the collective bargaining they enforce, tho he condemns their insistence on a single standard rate in each employment as tending to prevent the encouragement of those individual excellences in workmen which he most admires. Altogether he is cheerful and hopeful about the progress of the industrial classes, for has he not seen Yankees, Irishmen and French Canadians gradually follow each other as manual laborers, the displaced group always, in largest measure, in the second generation, rising to superior places as teachers, doctors, lawyers, superintendents and capitalists? He has no new solution of any labor problem to offer, unless his enthusiastic endorsement of a scale of wages sliding up and down in harmony with cotton prices amounts to the proffer of a solution. As a pacifier this sedative has usually worked well only for a short time. Since the workmen have no jot of control over prices they soon get tired of seeing their wages

fluctuate according to the vagaries of cotton speculators and of fashions in dress goods. If the irreducible minimum be sufficiently high they may be content for a long time, but to the principle that they shall share the dead losses of a business they don't own by accepting drop after drop of a descending wage scale they never long assent.

The Quaker Boy on the Farm and at School. By Isaac Sharpless. Philadelphia: The Biddle Press. Pp. 8. 81

The question was recently asked by a prominent English statesman why it was that among the leaders in every forward movement, political, social or religious, were always to be found some men who were either Quakers or who had had a Quaker bringing up. An answer to such a question is to be found in President Sharpless's little booklet on the Quaker boy:

What better boyhood could there be for a man who is to do great work? A body hardened by years of pure air and active but not excessive exercise; a mind braced by a school life which required things to be done by himself and not by the teacher, and broadened by a careful reading of a limited number of improving books; a character formed by regular duties, the example of conscientious living, the ever-present sacredness of moral responsibility, abhorrence of evil and sympathy with suffering; and a hearty respect for a religion of the simplest character and absolutely without hypocrisy.

Both the home and the school life of the Quaker boy of a generation ago were narrow. Music and art were excluded from the school courses. Even the classics contained too many heathen allusions and influences to be safe reading for young Friends, but the education that was given was thoro, and the mental and moral discipline were excellent. President Sharpless also shows that boyish spirits and fun were not crushed out by Quaker discipline. Evidently the president of Haverford still cherishes memories of surreptitious visits to apple orchards, and pillow fights in which the tardy boys caught out of bed were like to have to make a sad accounting on the following day. But in spite of these natural ebullitions the boy who was sent for his education to a Quaker school was likely to start in life with a predisposition to truthfulness and honesty and sobriety of thought and conduct.

Literary Notes

....*Das deutsche Element in den Vereinigten Staaten*, by Pastor G. P. von Bosse, of Philadelphia, a work of five hundred pages, is a scholarly production with many *nova*. Its character is described by the subtitle "Unter Berücksichtigung seines politischen, ethischen, sozialen und erzieherischen Einflusses." (Stuttgart: Belser.)

...The late Edwin Burritt Smith, of Chicago, was one of those meritorious minor figures in the civic life of the hour whose memory survives but vaguely the laudatory obituary of the newspaper. Active, first of all, in the public affairs of his city and State, Mr. Smith gave no less attention to the larger problems of the nation, being much in demand as a speaker and writer upon such subjects. What he had to say on municipal government and municipal franchises still is worth reading, and so is what he spoke and wrote from the fullness of his conviction in the days when imperialists and anti-imperialists among us were waging a battle that now would arouse only a mild and perfunctory interest. The more important of Mr. Smith's addresses and contributions to various periodicals have been collected and published in a volume entitled *Essays and Addresses by Edwin Burritt Smith* (Chicago: McClurg, \$2.50). Their enduring value lies in the sterling quality of their Americanism, their sturdy upholding of its true ideals.

....A third edition has been issued of that collection of Chinese human jottings, *John Chinaman and a Few Others*, by Mr. E. H. Parker, professor of Chinese at the Victoria University of Manchester, and at one time British Consul in China. The object of the book is to illustrate Chinese characters by means of concrete examples taken from daily life, from official circles, the army and navy, the *literati* and professional men, criminals and the police, the reaction of the Chinaman to foreign influences, beneficial and otherwise, receiving its share of attention. One is tempted to quote: The word *kot* (a certain plant), which occurs in the Odes of Confucius, is *tabu* in Canton, because, according to Mr. Parker's Chinese informant, "when foreigners first came they were observed to utter a terrible imprecation whenever they were enraged. No one knows exactly what it means, but I am informed that *kot t'am* is the name of an English deity whose wrath is called down upon the heads of luckless Chinamen on the slightest provocation. Now, the second of the Odes runs *kot chi t'am hai*, and this whole sentence has a tendency to be tabooed." (Dutton, \$1.25.)

...The very name of the late Simeon Solomon has remained unknown to all but the most minute of American students of English art in the nineteenth century. Born in 1841, he died in 1905, his death serving to recall for a moment a career whose early promise had never been fulfilled. Solomon showed in all his work the strong influence upon him of the Pre-Raphaelites; he also showed that neglect of

thorough technical training which his temperament commanded. Of all his work, only the "Habet," in oils, can be said to have achieved a wider interest. Thackeray and Swinburne praised him, but in vain; there was something lacking in the man himself. A handsome folio devoted to his memory, *Simeon Solomon: An Appreciation* (New York: Frederick Fairchild Sherman), by Julia Ellsworth Ford, contains a biographical sketch, twenty-three reproductions of his drawings, and a partial list of his works. Thruout, the impression is one of promise unfulfilled, rather than of performance; one cannot but feel that Solomon's contemporaries did him no injustice in forgetting him, nor that posterity, having no injustice to redress, is unlikely to take a greater measure of interest in him. He is not strong enough for a posthumous cult, not even for a fad.

Pebbles

HEWITT—I painted this picture to keep the wolf from the door.

Jewitt—If you hang it where the wolf can see it I guess you will succeed.—*Judge*.

"Do you think your boy will ever attain your standing as a financier?"

"I guess he'll do," answered the eminent operator. "Last week he gave me a quarter to keep for him, and he has already drawn \$2.45 on account."—*Rocky Mountain Traveler*.

FOR SALE—Cheap, a bull; 15-16th pet Jersey, 1-16th concentrated bull dog; will sell to a Christian man who does not fear death; I have him tamed down some, so I can feed him over a 7-foot tight board fence without his tearing it down to get at me. John Fox, Bowmar avenue.
jy11-1tp.

—Adv. in Vicksburg (Miss.) *Herald*.

"REGINALD, dear, you puckered up your lips just then as if you were going to kiss me," said the beautiful creature languorously, as she lay stretched on the beach surveying the frolics of Neptune.

"I intended to," replied Reginald hesitatingly, "but I seem to have got some sand in my mouth."

"For heaven's sake swallow it," exclaimed the young lady. "You need it badly in your system!"—*Young's Magazine*.

THE *Educational Review* has received a composition written by a boy in a Springfield (Mass.) school after visiting the recent tuberculosis exhibit in New York, from which we extract the following information: "Tuberculosis was started in 1884 by Dr. Trudeau, who had it in the Adirondacks. Although consumption is not herited and does not belong to this climate, it is getting very popular. The sleeping bags are very useful to the consumptive people because they can put their heads alone into them or leave their heads out and put the rest of the bodies into them. I saw the germs. It is a big white ball with blue spots on it. I think it would be fine to sleep in one of those beds with the head inside and the lungs outside."

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - New York

A WEEKLY MAGAZINE. FOUNDED IN 1848.
One Year, \$2.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, \$1.75 a year extra; to Canada, \$1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with \$1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

A Reform of Prime Importance

IF the education of the young is of prime importance, so that we wisely pay from the public taxes for nothing more willingly or generously than for education, then a case like that of the boy Sidis, who has at last been allowed to enter Harvard at thirteen, after having been refused admission because of his youth for three years, is full of suggestion and instruction.

We are fully convinced that the popular doctrine as to the education of children is almost fatally false. It assumes that the young child should be put to no tasks of learning until it is seven years old; and yet when the child is four years old it has learned to talk one and perhaps two languages. This has required tremendous mental application, as any one knows who at adult years tries to learn to speak a new tongue. Yet the child learns these hundreds of words, and by the dead lift of memory, and while picking up a thousand other facts of experience. The child who has been able to do this does not need to waste three or four years more in mere play. This child at two years old had got well started in learning to read a shockingly mis-

spelt language. At four and five he was well along in arithmetic, and had achieved algebra and much higher mathematics by the time he was ten. In fact, he was at that age well fitted for college.

We have no evidence and no reason to believe that he was possessed of very extraordinary capacity. His father says he is no prodigy. Doubtless of such parentage he was of more than usual brain ability, so endowed by nature; but there are many such. Able parents may expect able children; and if they have them they ought to give them the best advantages; which means that their most impressible years should be improved by constant and careful education, and, if possible, by individual teaching under persistent and faithful pressure.

This does not mean that the child is to be consigned to brain fever and death. Not at all. We know that it is possible to press the child along—that is, the naturally quick child, so as to make him, like John Stuart Mill, what would be regarded as a prodigy, and yet keep a healthy body, thru full hours of exercise and play. A child should be able to read well at four or five; with a phonetic system he could do it at three. From that point the progress is swift and easy, and can be enjoyed by the child.

You can't do this with a naturally dull boy. It does not pay to crowd a thousand dollar education on a ten dollar boy. Such a commonplace boy can putter thru the common drill, be ground thru the common mili, and come out fitted for common manual industry. But if it is a choice boy or girl, of superior stock, no labor or money is too much to be expended.

Nor let it be said that it is too bad to deprive the child of the pleasures of childhood. The pleasure of learning will be the chief of all pleasures. Nor let it be said that the boy loses so much of the enjoyment and value of college if he goes to it so young. The boy is not for the college but the college for the boy. If the boy gets thru the academy and the college or university four years earlier than his companions he has four years the start of them, and can make progress in higher things during the four years that they are lagging behind.

What we want to impress on the par-

ents of presumably bright children is, that the years are wasted that are given to learning how to cut out paper patterns and to playing school, instead of to real, actual study. A child of five or six should be well trained in the privilege of real tasks of study. To be sure he cannot get this in the public schools, for the current pedagogy is taken up with psychologies of childhood when it ought to be actually teaching concrete children. Here is the case of what can be done, what has been done occasionally, if not often, when the parent has the sense and faithfulness and also the opportunity to do it. It requires parents that have the time to give to teaching their children or to provide tutors. This boy's father believed the little child could learn, and he was willing to teach him; and the boy responded, as many another boy would. It can be done again. It will not kill the child. A child is killed by lack of exercise, not by much study. This is a hearty, healthy boy. No study is more severe than that which acquired the English language. The child is worth it, worth more than colts or calves or pigs, and yet many parents, or possible parents, give their labor to the production of fine colts and calves and pigs, and fail to understand that children are beyond all comparison the chiefest of all wealth, and that what makes them valuable is their education, just as hay and oats give value to colts and calves, or corn puts fat on pigs. There is more intelligence put in fattening pigs for the market than there is by the same parents in fitting their children for life. Let it be understood that this boy is not specially precocious, except as he is unusual, because he has had an unusually good teacher; but your baby well equipped with brains could do just as much if you or your wife could take the time to teach your child that this Boston man gave to his.

It Must Come

NOT only President Taft but the people are crying loudly for postal reform. They may be delayed, but postal savings banks and parcels post are sure to come. The Western States are almost unanimous that the post offices be enabled to take deposits of the laborers' earnings.

It is said that in some sections large amounts of money orders are drawn and held by Italians, as a safe method of securing their earnings. Nineteen millions of dollars has been sent during a single year over to Italy; mostly in the form of 475,000 money orders—averaging \$40 each. Seven millions has gone to Russia, nine millions to Hungary, eight millions to Austria and twelve millions to Great Britain. This represents only a small part of what these toilers would be glad to put into postal savings banks. It is said that a large part of this sum, or these sums, is sent over to be placed in their home savings banks, because they have none here.

New England has one-third of all the savings banks in the United States; New York and Pennsylvania are nearly as well supplied. Outside of these States Illinois is fairly well supplied, altho there are parts of that State where investors must travel fifty miles to reach a bank. In the South the average travel requisite is thirty-three miles, and beyond the Rockies the average distance to be traversed to reach a savings bank is fifty-five miles. The problem does not concern so much the laborers in our cities as those who are scattered widely all over the hills and prairies.

Postal savings banks can hardly affect in any detrimental way our established banks, but, by increasing the thrift of the people and their economic habits, it is probable that depositors would be greatly increased. What we want is to create an economic instinct in the people, in the place of a too ready tendency to spend and waste. Amos Lawrence used to say that a dime was worth more to an ordinary man than a dollar, for if he learned how to use his dimes he would have his dollars. If the Government pays, as proposed, only 2 per cent. on deposits, the depositors will soon be trained to seek a higher per cent. in the regular banks. The object of postal savings banks will therefore be, first to encourage foreigners to deposit their earnings in this country, and, second, to create in our own citizens a disposition to save their earnings and place themselves and their dependents out of reach of old age poverty.

As for parcels post it is an entirely dif-

ferent question—a question of common sense. We have parcels post conventions with thirty-two countries, and the rate is in all cases 12 cents a pound; but the rate on a package from Chicago to New York is 16 cents a pound, so that the same package sent to New York would be 64 cents, while to Berlin it will be but 48 cents. It certainly is an abnormal state of affairs that makes a man pay more for the carrying of a package one hundred miles than one thousand. The proposition has been to equalize these charges; nothing more. The result would be a decrease in the rates of express companies, but not unjustly. It was figured out by Mr. Meyer, in one of his reports as Postmaster-General, that a general merchandise rate of 12 cents a pound would produce a revenue of \$240 a ton, and a profit of nearly \$30 a ton—which would seem to be quite enough.

Opposition to the parcels post has come entirely from two sources, the express companies and the country retail merchant. A charge of 5 cents for the first pound, and 2 cents additional up to the eleven pounds limit, could hardly damage the country merchant, because it would facilitate consumption and greatly increase his business. The additional revenue would at the same time go a good way toward making the rural routes self-sustaining.

The American Consul at Nottingham, England, reported recently that the British Post Office carries parcels not exceeding eleven pounds in weight, and not over three feet six inches in length, and does this for 22 cents. In this country only four pounds can be carried in one package, so that the shipper would have to make up three packages and the postage would be \$1.76; eight times as much as in England. If a package is lost in the British mails, not containing money or jewelry, \$10 can be recovered. Registration, however, can cover a compensation as high as \$2,000, by paying a fee not to exceed 44 cents. For twenty-four pounds, conveyed to Scotland, the charge is 60 cents. The German parcels post charges even lower rates, sending a twelve-pound parcel at one-fourteenth of the charges made in the United States. So it comes about that a parcel sent from Chicago to London is one-fifth less than

on a similar parcel sent to St. Louis. Both Germany and Great Britain are making money on their post service, besides benefiting their entire population in all forms of trade.

Arguments along this line stand upon data so clear that nothing need be said but to lay them before the people. There really is nothing but selfishness in the way of granting to the American common people privileges equal to those of the leading European States. The American people are not slaves, and they are waking up very rapidly to an unwonted self-assertion. We recognize the wonderful work accomplished by our express companies and we should be slow to see them defrauded of just compensation. Nothing of the kind can come, however, from a reformed postal service; bringing us to a full equality with our civilized neighbors. Both postal savings banks and a parcels post service will come.

Our Dependents and Dependencies

BEYOND all question we are an altruistic people, at least millions of our people are, enough of them devoted to human welfare to create and attend hundreds of societies and meetings whose purpose it is to relieve suffering and make the world better. Every day's journal reports such meetings, and October is no exceptional month for them, altho not all are as fully attended, or as full of enthusiasm, or as widely reported in the newspapers as the American Board which has met in Minneapolis, the American Missionary Association which has met in Burlington, Vt., and the Indian Conference at Lake Mohonk. It is particularly of the last that we now speak.

This conference had its origin in a meeting of some twenty missionaries, missionary secretaries and Government officials in the parlor of the Rev. A. L. Riggs's Mission House among the Dakota Indians at Santee, Neb., twenty-eight years ago. Among those present was Mr. Albert K. Smiley, of Lake Mohonk. He was so stirred up by this meeting that he resolved to call an annual meeting of friends of the Indian at his

summer hotel. Every year from that time this meeting has been held, and hundreds every year have been invited to it. At first the relations of the Government to the Indian service were unsettled and unhappy; but every year this conference discussed, consulted, and in a definite platform presented its conclusions to the Government in the form of specific advice, and also to mission boards. The reform in Governmental methods has nearly kept pace with the Mohonk recommendations, so that now the great principles are settled which will give the Indians their allotted homes, break up the reservations, make the Indians full voting citizens and merge them in the body politic. It only remains to carry on the work on the broad lines already adopted.

Meanwhile other races have come under our colonial control, and, as concern for the Indians was relieved, anxiety for the people of Porto Rico and the Philippines, but hardly for the Hawaiians, increased, and the Mohonk Conference enlarged its field of view, embracing all these our new possessions.

As far as the Indians are concerned, the most important address was that by Mr. Valentine, the new Commissioner of Indian Affairs. He is a man who is not working for his salary, but for his love of his work. He told the conference what the bureau is doing, and he particularly asked that he might be given an increased number of inspectors, paid sufficiently to secure trustworthy men competent to see to it that the bureau's work is faithfully done. There are needed 170 inspectors and agents of this character, and this is the main thing the commissioner asks for. Beyond this improved oversight we need fewer boarding schools and more and better local schools that shall merge into the public school system. There are 50,000 Indians for whom no Christian mission work is done, and this in a Christian land.

For the Indians, the Porto Ricans and the Filipinos the platform adopted presents "the ultimate end of self-government." For the Indian it means the abolition of the tribal condition and the possession of American citizenship; for the Filipino the opening of the American market, as has been granted to Hawaii and Porto Rico; and for both the Philip-

pinos and Porto Rico the maintenance of local self-government in preparation for future insular self-government. The platform does not decide the question of ultimate independence for the Philippines, nor does it definitely declare for citizenship or ultimate statehood for our island possessions. That the Porto Ricans should be made citizens would seem only decent; and there is but one argument against it that we know of, and that is that general citizenship, and at least the Territorial condition, would deprive the Porto Ricans of the exceptional privilege they now have, and for the present need, of retaining for their own exchequer the income from their custom houses. But that is no reason why Congress should not pass a law allowing any Porto Ricans who wish it to become citizens. They were citizens of Spain; now they are citizens of no country, simply subjects; and that condition ought to cease.

The Bettering World

THE condition of England has alarmed her statesmen, flooded the newspapers of two hemispheres with scarehead copy, filled an alcove of blue books with statistics, rattled the British mind and provoked Mr. C. F. G. Masterman to write another book. "A suggestive and sad book" Mr. Frederick Harrison calls it, but even so we have reason to be glad that he wrote it, since Mr. Harrison, in turn, has been moved by it to write for the pages of *The Sociological Review* a survey of the economic and moral state of man, which ought to be read by every human being who knows the English language, while every unfortunate who doesn't know it should learn it for the sake of reading what Mr. Harrison has said.

Mr. Harrison admits the truth of most of the indictments of modern civilization and concedes "the terrible warning they bring to us." He allows that Mr. Bernard Shaw, Mr. G. K. Chesterton and Mr. Belloc "have a pretty wit" and are masters of paradox, but he is not prepared to accept them as "sources" for a scientific sociology. Neither is he willing to follow unreservedly the socialist orators and the sensational romancists

"who paint society with the brush of a Goya and the pen of a Zola." They tell the truth that they see, but they neither see nor tell the whole truth. Looking back over sixty years of deeply interested personal observation of the changes that have been going on in the thought and activity of the western world, Mr. Harrison sees again the vision of a new heaven and a new earth, "man's earth having grown to be a real heaven, and our new heaven having become a regenerated earth."

The best evidence that his vision is one of realities Mr. Harrison finds in simple facts that no one disputes. In his own lifetime he has seen the death rate reduced from 20 to 40 per cent. in civilized communities, so that population increases, notwithstanding a diminishing birth rate. He remembers when little children climbed chimneys to sweep them, and such hideous things as ghastly hangings in public, burials of the dead in great cities, poisonous wells, general illiteracy, wages at 10 shillings per week, the old English pauper system, and slaveholding by British subjects. Some evils have increased in area, but not, Mr. Harrison thinks, in intensity. It is difficult to strike a true balance, but the balance is plainly to the credit side.

And the diminution of evil has not been accidental. Society has not spontaneously cured itself. The countless more or less organized movements for social betterment have been too often superficial, formal, partial, deceptive, at the best, and hypocritical at the worst. Nevertheless they have surely, altho slowly, achieved results, and this in the face of the most disturbing transition that our planet has known. Steam, electricity, photography, steel, instruments and machinery have transformed our material environment with incredible rapidity, while science has as marvelously broadened our intellectual horizon and changed our moral outlook. Incidentally, the religious structure on which the old civilization reposed has been shaken. Inevitably so profound a transformation—material, intellectual and moral—has bred new difficulties and new evils. Nevertheless, we have made headway against them.

The reason for this large measure of

success, of undeniable betterment, the ground for hope and faith, Mr. Harrison finds in the corresponding change that has been taking place in essential religion, as distinguished from its old dogmatic formulation. Like all things else, religion has been and is being renewed. It is becoming "a compound of science, ethic, art and love." It is at once practical and moral, and by means of it we shall have a radical reorganization of our whole industrial and social life; not a mechanical socialism, but a social structure quick with humanity, intelligence and practical good sense.

We have not spoken the language of exaggeration in saying that every one should read Mr. Harrison's report upon the moral state of mankind. Not in many a day has the optimistic note been sounded so strong and true from a silver horn.

Comrades and Sweethearts

WE have rarely, if ever, published a contribution on a more important subject than that in the present issue on "Why Do Not Educated Women Marry?" It is not a question of the happiness of a few individuals, but the future of civilized races depends upon it. If the more intellectual and culturable members of both sexes decline to marry, as in increasing numbers they do, no religious revival, no moral reformation, no political purification, no financial management, no social reorganization and no advance in science, can prevent the degeneration of the race. All of these things are in fact dependent upon the improvement or at least the maintenance of the present standard of natural capacity. If the spiritually gifted of a generation become priests and nuns, and the intellectually gifted become celibate professors, tho it be but one among ten thousand, there is no conceivable way by which the loss to humanity can be repaired in future generations.

In how far the college men and women constitute the intellectual *elite* of the country it is not necessary to discuss here. Some of them are in this class, and these alone we are considering. None of the universities could keep up

their numbers thru the descendants of their alumni, altho the coeducational colleges could come nearer to doing this than the segregated colleges for men and women.

Of the educated women who do not marry some are unfitted for marriage by constitution or temperament, and go to college because it is the best way to become self-supporting. Then there are some who have become spoiled as wives and mothers by their college training. They acquire false ideas of relative values and become exclusively absorbed in bookish things. This class is very much smaller than the opponents of the education of women believe, but it undeniably exists.

But our contributor is a representative of another class of which we hear little because few will confess to belonging to it, the Great Unasked. Her confession is obviously frank and sincere, and is, we presume, as accurate as any such self-revelation can be. Her education has not "gone to her head," as it does with some girls, alienating them from practical life and filling them with an exaggerated sense of their own superiority. It is safe to say, in so far as it is safe to say it in advance of any woman, that she would make a good wife. It is also safe to say that eligible parties have come within the orbit of her wide acquaintanceship, so the question is why none of them have been attracted to her.

She apparently wants to know if it is her own fault. We are free to say that we think it is, tho the men may be equally at fault for not discerning in her the qualities they desire in a wife. But has she shown to them or to any one of them that she possessed those qualities? She has shown herself likable and they have liked her. Had she shown herself lovable, they would have loved her. Do her best men friends know this side of her nature as well as the casual reader of *THE INDEPENDENT*? We should not be surprised to receive a dozen letters next week from men who want just this kind of a wife, possibly among them one from some masculine friend who had talked with her and walked with her and waltzed with her and yet has not known her. We should not undertake to for-

ward such letters, however, for she must reveal herself in her own way to the man whom she regards as worthy of such a revelation. She must let him know that she is capable of being a sweetheart as well as a comrade. How she is to do this she must determine for herself. We are not recommending any unwomanly tactics, quite the contrary. A look, a word, a touch will suffice if he is responsive; if not there is no harm done for he will guess nothing. The Oriental woman who veils her face leaves her eyes uncovered. The educated woman veils even her eyes. In the fairy tale the hero sees the enchanted princess thru a gap in the hedge. If the hedge had been tight he would never have had the courage to brave its thorns and she would have been still sleeping instead of living happily ever after.

There are many good reasons why men should marry. There is practically only one reason why they do. Men do not as a rule marry from a sense of duty to society, for the improvement of the race, to get intellectual companionship, to conform to the wishes of their parents, to establish their social positions, to acquire a dot, or to get a housekeeper. They marry because they fall in love. The other reasons dominant in other ages and other countries have been largely eliminated in modern America, throwing upon the last the whole duty of match-making. This is, we believe, a great advance in civilization. But it in part accounts for the fact that so many good matches are not made.

The educated American does not prefer stupidity to intelligence. He wants co-operation and companionship in a wife, rather than humble service. He desires both a comrade and a sweetheart but if he does not find them in combination he takes the second and in general he is quite right about it, too. But that explains why he sometimes passes blindly by women who are his equals and would make good wives in every respect and takes up some goose of a girl who may perhaps turn out to be a dragging, nagging nuisance for life. He discovered in her or thought he discovered a nature capable of arousing his affection and responding to it. This discovery

may have come about thru accident or design on her part. But the educated woman of his own class would have been on her guard to prevent such an accident and would have deemed it beneath her to give any encouragement to any lover-like advances unless preceded by formal and avowed negotiations. That is where she makes her mistake. She is behind the times in her methods, perhaps behind any times.

"Two things greater than all things are:
The one is love and the other is war."

In modern practice neither is preceded by a declaration. A young man does not decide in cold blood that he wants to get married and proceed in a logical way by drawing up a list of specifications for his ideal wife and then checking off his feminine acquaintances to see which corresponds to it most nearly. Instead he gropes about as tho he were playing blind man's buff, hitting against the furniture and knocking things over, until by some lucky chance he comes upon a warm human hand and seizes it. It is not always chance. Sometimes the hand is held out toward him by one who can see. If women want the right of proposal they may have it to keep. We men rarely have occasion to use it. Mrs. Anne Warner, in a recent story, tells of an inquisitive mother who wanted to know all the details of her daughter's engagement:

"I'm not curious, Emily, but how did he begin? Did he take your hand, or did he put his arm around you? I've always wondered about proposals; I didn't have a real one myself, I just stepped on a snake when I was out walking with your father."

But our anonymous bachelor of arts is not afraid of snakes. She has dissected them in the biological laboratory. Well, then, she will have to devise her own method, unless perchance the little blind god take pity on her and place in her path, at the psychological moment, whatever is for the new woman the equivalent of the snake, something powerful enough to disturb for a moment her cultivated equipoise, to break down her carefully erected barrier, and to disclose her to her companion as she is, no goddess, not even a muse, but a human being, who like himself needs sympathy, love and help.

Revolutions South of Us

NICARAGUA's President, Zelaya, has been moved by the ambition that drove Barrios to plot and fight for control of all the Central American countries. But he was confronted in the north by Cabrera, a ruler of a similar type, and restrained by the joint disapproval of the United States and Mexico. Now Estrada, who helped him to obtain the power he has abused, and who received high and profitable office as a reward, turns against him and seeks his place, with much talk about patriotism and the "rehabilitation of liberty." We see no evidence to prove that the people of Nicaragua would be better off under Estrada than they have been under Zelaya. Bearing in mind the history of the revolutionist leader, and judging from numerous instances in the past, we should guess that Estrada has his eyes on the revenue and longs for power to levy taxes. It may be that we underestimate his patriotism, but we suspect that he is saying to himself that Zelaya has enough and should retire to Paris or some other comfortable European capital.

It is unfortunate that the people of Nicaragua, of whom we hear nothing except when they are fighting under some revolutionist or ambitious despot, cannot be governed by some one who is honest and truly patriotic. Their condition will improve after the completion of the Panama Canal. Then they will be assisted by immigration from the North, and our Government will not be inclined to tolerate the continuous unrest which is due to the rule or the quarrels of ambitious thieves.

Such rulers have been the curse of Santo Domingo, where now, after some years of peace, during which the revenue has been collected and used honestly, under the direction of officers who are really agents of our Government, a revolution has broken out that menaces this favorable condition of affairs. Once more it is the attempt of rascals to get hold of the tax receipts. Our Government may reasonably refrain for the present from interfering in Nicaragua, but it should send two or three gunboats to the north coast of Santo Domingo. It should not fail to support the Govern-

ment of Santo Domingo, which has been true to the agreement under which a large part of the revenue, honestly collected, has been used in paying the republic's just debts.

The Conquest of the Tropics

ALL the countries of the temperate zone have now become, some of them absolutely and some of them comparatively, so crowded with population that the question of an outlook for the white race into the tropics is of much more than passing interest. So far it has almost been a rule that white men in the tropics either did not live long or else that their vitality was almost inevitably sapped and their energy greatly lessened by tropical conditions. This effect of the tropics used to be attributed to the enervating influence of the climate itself, but we have learned to recognize the reason more definitely. The night air all over the world used to be considered very unhealthful—until we discovered that the main reason why in most countries the leaving of windows open at night was fraught with danger was not because the night air, which is indeed a little purer than the day air, found its way in, but because the mosquito, whose favorite hunting time is at night, for, strange as it may seem, he does not stand the sun well, took advantage of the open window to find a way to his victims to inoculate them with various diseases. The question of health in the tropics is almost entirely a question of control of the mosquitoes.

Dr. W. C. Gorgas, who is in control of the sanitation of the Canal Zone at Panama for the United States Government, delivering the address as president of the American Medical Association at Atlantic City in the second week in June, dwelt particularly on this feature of the "Conquest of the Tropics for the White Race," and his address, as published in the *Journal of the American Medical Association* for June 19, makes it very clear that the great problem of making the tropics habitable for the white man has been solved. The death rate among the men employed in the Canal Zone for 1908 is, according to Dr. Gorgas, "probably not any higher than

that of a similar body of men doing the same work in New York State." The death rate for Americans, taking into account all causes, including violence, is under 10 per 1,000. This is, of course, for a selected population of men who were very healthy to begin with or they would not have gone to Panama, but the death rate is no higher than for similar populations in the healthiest localities in the United States, and it is much lower than that from most parts of the country. These magnificent health conditions obtain also among all the Government employees. In 1908, out of nearly 45,000 men employed by the Government, less than 600 died. The rate per thousand was just about thirteen. There had been constant improvement in this matter ever since the Government secured control of the situation. In 1905, out of 16,000 employees, there were 427 deaths—a death rate of nearly 26 per thousand. In 1906, when the number of employees almost doubled, the death rate rose to over 41 per thousand. In 1907, in spite of a very large increase in the number of employees, up to nearly 40,000, the death rate fell back below 29 per thousand. In 1908, as we have said, this death rate was more than cut in two, making Panama the most healthy place in the tropical world, as healthy as any of our large cities and much healthier than most of the cities of Europe. Even among the inhabitants who are not employed by the Government the death rate has fallen correspondingly. It has been nearly cut in two since the Government has completed its work for the sanitation of the Isthmus. Work on the canal before this time has always greatly added to the death rate in Panama, but under American methods the Canal has proved a great blessing, instead of the curse that it was, by the introduction of foreign labor and all the abuses that came in their train. A greater triumph for modern medical methods could not be chronicled than this.

All this has been accomplished by the application of the single principle that the mosquito is responsible for the disease and the debility of the tropics. The one thing that has been kept in view always has been the destruction and eradication of the breeding places of the mos-

quito. Stagnant water of all kinds has been gotten rid of. Subsoil tiling makes the ideal antimalarial drainage system; it does away entirely with mosquito breeding, and after it is once laid no further expenditure is necessary in keeping the ditch open. A superficial ditch, owing to the rapidity of tropical growth, is dangerous and a very expensive matter to keep clean. Some of the suggestions where drainage is not possible should be helpful to many country places around New York bothered by mosquitoes during the summer. Where a town is situated near a large swamp or lake, for instance, the mosquito larvæ can live only around the edges of the water, where they are protected by grass and algæ from fish, or in holes made by the feet of animals in the soft soil along the margins of the water. At Panama they have kept the brush and grass cut and see that no animals have access. Where the town is situated near a small stream the banks and the stream itself are kept free from grass and algæ.

One feature of the prophylactic work against the mosquito in Panama that has not received the attention it deserves in other places, but that Dr. Gorgas considers of the greatest significance, is the removal of brushwood. He says: "Brush cutting we regard as second only to drainage in importance as an antimalarial measure. If brush and grass are thick about a dwelling mosquitoes seek them as shelter from the wind and in continuous stretches of this the anopheles—the malaria-breeding mosquito—will wander by short flights a mile or more from a breeding place. A clear space of a hundred yards will, as a rule, stop her flight. We keep the brush grass cut within a hundred yards of the point to be protected." This is a large item of expense, as both grow very rapidly at Panama, but it has been found well worth the while, and now in many cases the ground is in such condition that horse mowers and scythes can be employed with results that are very striking. Colon, where the insects were an almost intolerable pest, is now nearly free from mosquitoes of all kinds. Even culex, the non-disease bearing mosquito, which is very strong on the wing, has almost entirely disappeared.

Dr. Gorgas does not hesitate to say that "the debility from which the white

man has suffered in the past at Panama and in other tropical countries is due to malaria principally, and that if he protects himself from this infection he will remain as strong and vigorous as if he were living in a temperate climate." Dr. Gorgas points for the proof of this to the conditions of health which now obtain among the Americans at Panama. He considers that this opens up the tropics absolutely to the white race, and that during the next few centuries there will be a definite tendency on the part of the white man to drift into the tropics. He ventures to predict that "after the lapse of a period, say equal to that which now separates us from the Norman Conquest of England, localities in the tropics will be the centers of as powerful and as cultured a white civilization as any that will then exist in the temperate zones." This is a glorious prospect, and the initiation of its possibility by our work on the Canal is of itself enough to make us feel proud of what the American Government and American medical men have accomplished in this great field.

Our Increased Price

Our readers have already been informed of the prospective increase in price of *THE INDEPENDENT* on January 1, 1910. Elsewhere in this issue an opportunity is given to our present subscribers to extend their subscriptions at the old rate. The increase from two to three dollars is a necessity, but we are anxious to do all we can not to have the weight of the increase fall on the readers who have given *THE INDEPENDENT* their loyal support for so many years. Even at three dollars, *THE INDEPENDENT* is one of the less expensive weekly magazines. Several of our neighbors charge four dollars, and one charges five dollars and twenty cents. The new rate is really the old rate, for in 1898 our price was reduced from three to two dollars, and now, after eleven years, owing to the increased cost of all commodities, we are obliged to revert to our former price. Our readers, we are sure, will approve, for we have received many letters wondering how we can give so much for so little. It is our object at the new price to improve and enlarge *THE INDEPENDENT* and to make our magazine indispensable to the reading public.

The Vildest of Trades

An article in *McClure's Magazine* exposes the methods and the extent of the white slave trade, the vilest of all trades, which by cajolery, deception and force supply young women for marts of infamy. It is a shame to our great cities in our centers of civilization that such places exist, and a further shame that it is a business to provide victims for them, and worst shame of all that they are protected for the profit there is in them by the foulest of political leaders. One can hope and half believe that there is some exaggeration in the story told of the extent of the evil, but we cannot doubt, for the evidence is clear, that it has been encouraged by the very men whose business it ought to be to suppress it. The whole subject is so low that one is almost unwilling to touch it even to reform it, but that is no reason why it should not be attacked. There is too much of a stupid opinion that it is a necessary evil, even a protection to other innocents; but the truth is that as it exists it is the foe of social purity, the breeder of disease and shame, and that it stands in the way of honest marriage and decent family life. It is not its poor victims only who are condemned by it to the unwedded life. Women in their own defense should rise against it and suppress it, while any political power which in New York or Philadelphia profits by it the men who vote should hunt from office with angry contempt. And yet Judge Gaynor, Tammany's candidate, answers this article simply with a torrent of abusive adjectives, and the apology that three authors argue that social vice cannot be escaped.

Within Five Years

Prophecy is a very uncertain business, but we hope Mr. T. P. O'Connor, the famous Irish leader, is correct in his anticipation that within five years Ireland will get Home Rule. It will come soonest, he thinks, if the Lords reject the budget, for that will mean speedy dissolution and a general election, which will carry in a Liberal majority and cut the claws of the Lords. Their power of veto will be made only suspensory until another election. If the Upper House accepts the budget, the present House of

Commons will hold on for another year, and be followed by a Conservative majority at the next election. The Irish do not care which party gives them Home Rule, and Mr. O'Connor seems to expect it then from the Conservatives, who, he says, have always given them more than the Liberals. Ireland asks for nothing more than local government as to local affairs, much as in this country a State government exists in complete consistency with loyalty to the general Government. One wonders why, when Ireland is allowed her separate sub-Parliament, Scotland and Wales, and England also, should not be allowed theirs, and thus relieve Parliament of its burden of local legislation.

A Filibuster of Science

Professor James has described the great scientist as a man who had an intense desire to prove himself right coupled with an intense anxiety lest he should make a mistake. Cesare Lombroso, the Italian criminologist who died last week, missed being a great scientist because he lacked the second of these qualifications. He raided new territory, but he was not able to annex it to the realm of human knowledge. His work is impossible to accept as a whole, yet it contains the germ of more than one new science. He lacked the common acquirements of our modern men of science, thoroughness, caution and discrimination, but he possessed the rarer virtues of originality, brilliancy and daring. His son-in-law, Professor Ferrero, the historian of Rome, who recently lectured in this country, said of him:

"In spite of the fact that he is considered one of the greatest psychologists of this century, there is no one who has less penetration. Great in theoretical psychology, he is as ingenuous as a child in practical psychology and easily mistakes a fool for a great genius or a knave for an ingenuous enthusiast."

A good example of this defect, as well as of his openness of mind and honesty of purpose, is his recent investigation of Eusapia Palladino, resulting in his conversion to spiritualism, which he had all his life opposed. How much truth there is in the two theories with which his name is chiefly associated, that great criminals are insane or physically abnormal and that great geniuses are like them

in this respect, is left for the future to determine. Tho his conclusions were too rash and sweeping, he should not be held responsible for all the sensational forms in which they have been popularized.

Justice Peckham The death of Justice Peckham leaves eight living members of the United States Supreme Court, of whom three, Chief Justice Fuller, Justice Harlan and Justice Brewer, are entitled to resign for age, being over seventy years old, as was Justice Peckham. But seventy years do not bring old age in these days, and our justices, like other men, prefer to work as long as they are able; Chief Justice Fuller and Justice Harlan are in their seventy-seventh year. Justice Peckham was one of the ablest men who have ever graced the bench, and a number of his decisions have been of capital importance to the commercial and financial business of the country. No one questions their soundness, but it is much questioned whether the law they are based on is a wise one; and President Taft has announced that he will advise Congress to modify its legislation as to trusts which in many cases forbids such agreements between railroads as may be of advantage to the public, legislation which was intended to operate rather against monopoly in manufactures. Justice Peckham was a Democrat, and President Taft may not find it an easy task to select a Democratic lawyer of the first rank to take his place. The names already mentioned are not of men much known to the country for their legal prominence and ability.

A Comprehensive Church On the plea of Church unity the Welsh Bishop of St. Davids is arguing vigorously against disestablishment in Wales. The Church of England is, he says, a comprehensive Church, the National Church, and to lose it would be a sad loss to Church unity. In Wales it is not a national Church; quite the contrary; it is simply the Established Church, the Church of a minority, to which certain special privileges are given by the superior power of the Established Church of England. The fact that it is established does not make for

unity, but the reverse. Let it be disestablished, and like all the other denominations, depend solely on the good will of the people, and the ill will that goes with superior claims will pass away. All will be on equal terms and a real unity among them all, with a unity of condition, will be advanced. When the Bishop speaks of comprehension as a peculiar mark of the Established Church, that is true; it is comprehensive, and it ought to be. But so are other Churches comprehensive. Insisting on bishops, it is no more comprehensive than other Churches that have bishops or have none. In theology it is comprehensive, and so are other Churches, as everybody knows who follows the current of discussion. It is willing to take in all who wish to live a Christian life, and so are other Churches. Just where the comprehension comes in it is not easy to see. What gives offense is its claim to special privileges granted by the State which are denied to others.

A Question in Casuistry

Not long ago a man about seventy years of age, told one of our correspondents the following story of the method employed by a mulatto boy to escape from slavery. About the year 1850, in the city of Louisville, Ky., there were a number of slaveholders who were very earnest in their religious belief, and who threw no obstacles in the way when any of their slaves took advantage of the meager facilities to learn to read that were afforded in the afternoon Sunday schools in some of the churches. The owners, especially religious ladies, were open to the argument that if a slave could read the Bible he would stand a much better chance of saving his soul after death, and that Christian men and women should do at least as much in religious teaching for Africans on American soil as they were asked to do by means of foreign missionaries. But worldly prudence made them draw the line at learning to read written letters. No slave was openly taught to write or to read *written* English words, and for a very good reason. A mulatto boy who was employed about the house and stable of his master had thus learned to read in Sunday school, and, being blessed with more will power and intelligence

than the majority of his race, he resolved, if possible, to learn clandestinely to write. He obtained a little help at wide intervals from an anti-slavery white man whom he would visit when, as a favor, he could obtain leave of absence from his master. He preserved scraps of written paper that were found about the house in which he worked, especially those written by his master, and his handwriting was thus in time purposely formed to resemble that of the man who owned him. Combined with this acquisition, which he kept secret, he made himself useful to his master in a business way, and when about twenty years of age was frequently sent to Jeffersonville, Ind., provided with a special pass to be inspected by the officers on the ferryboat, on errands or various matters of business. Finally he forged a pass which gave him permission to travel northward in Indiana. After reaching Richmond (the Quaker settlement) his way was made easy by anti-slavery sympathizers, his own scanty savings having been exhausted, and within a week after leaving Kentucky he was in Canada, from which locality he wrote a letter to his master, explaining the circumstances of his escape to freedom. The handwriting on the letter proved that he was telling the truth, and, while his master regretted the loss, he was not averse to showing the letter to some of his white friends who had known the mulatto boy. They all took it as a joke, and many white men said, "A smart nigger like that ought to be free." Query at this date in 1909: Did the mulatto do wrong in committing forgery? If the struggle against slavery were still going on, the question would strike the mind of an abolitionist very much after the rule that all is fair in war if not in love. For this story we are indebted to Charles K. Needham, of New Albany, Ind.

Texas Democrats are discussing a question not wholly academic—whether the last Democratic platform binds Democrats now; Mr. Bryan, who is a prospective Texan, declaring it does, and Senator Bailey asserting that it does not. In such a debate we go with the Senator

as against the thrice ex-candidate. A platform ought to bind nobody unless he personally pledges himself to it. Every man should carry his platform under his own hat, and be ready to change it when he thinks it right. The insurgent Congressmen are not tied to the Republican platform, but have the right to do what they think is for the interest of their constituents, and equally Senator Bailey has the right to represent his State as against the Democratic platform, and this is innocent States rights.

The way the constitution intended to disfranchise the negro in Alabama was carried is illustrated by a little analysis of the figures. There were 81,724 ballots cast against the constitution. These votes were cast in the white counties. There were 108,613 votes recorded in its favor; but the remarkable fact is that the heavy majorities for it were reported from the densely black counties. Thus, Dallas County has 2,525 white males of voting age, and 9,871 blacks of voting age. But the vote returned was 8,125 for ratification and 235 against. It is perfectly plain this was a case of fraud, but the padded vote was necessary to secure the adoption. And so the people rule, and the constitution has disfranchised a hundred thousand white voters alone in Alabama, and given the State over to a political oligarchy.

Thirty years ago young men were leaving the Baptist ministry because they were required to preach close communion. Now there is nobody hereabouts to defend it. Even Professor Wilkinson is silent. But in the South the doctrine still survives. A Baptist church in Atlanta called Hugh S. Wallace to be its pastor. He told them that he did not believe in close communion, but they said that made no difference and unanimously called him. But the ministers refused to ordain him and the people still stood by him. A second time the committee of ministers declined, and this time the church weakened and Mr. Wallace withdrew, but he has set up a tent to preach in and will build a church of his own. And this in Atlanta!

A black man named Johnson is the heavy-weight champion of the fistie world, and crowds of colored people are very proud of him. And yet he will add not one farthing of value to his race. To be sure it is a fine thing to have the ambition to do anything well, and physical prowess and skill are not to be despised; but skill devoted to prize-fighting gives no wealth to the country and no moral character to its citizens. The negro race is lowered in character by the success of every prize-fighter, and its legitimate ambition is diverted or weakened. One man who raises a good crop of good yams and goobers is better than a thousand such.

They tell the story that some five years ago, when the favorite applicant for the position of superintendent of schools in the Kentucky county in which Louisville is situated was required to pass an examination, he gave the following answers to questions about the locations of cities:

Prague is in Russia.
Aberdeen is in Germany.
Venice is in France.
Oporto is in Italy.
Callao is in Ireland.
Malaga is in Malesia.
Lyons is in Belgium.
Batavia is the capital of a country in South America.

The Spanish Ambassador to the Quirinal, who returns to Madrid to assume the post of Foreign Minister in the new Liberal Cabinet, says that Spain is likely to "denounce"—which means either to end or amend—the Concordat with the Vatican. That will be worth watching. It will be interesting to learn whether the Vatican does not really prefer conditions as in France, under which the Pope will have full control of ecclesiastical affairs, with no interference by the Crown. In France this new liberty is much appreciated, altho the assumption by the State of Church property is deeply resented.

Lady Cook is visiting this country from England, and recalls the time when she, as Tennessee Claflin, and her sister, Mrs. Woodhull, were sent to

Ludlow jail for publishing "obscenity" in *Woodhull and Claflin's Journal*. She says it was a journal devoted to woman's suffrage, and its utterances would attract little notice now. It is agreeable to have such representations made, but older persons well remember that woman's rights of suffrage were much the least of the utterances of that paper, and that suffragists' journals did not send their editors to jail.

Six hundred Chinese young men appeared at Peking a few weeks ago as candidates for the scholarships given on the basis of the returned excessive indemnity fund. They were examined very strictly and competitively, and somewhat less than fifty were chosen and will soon be in this country to enter our schools and colleges. We trust they will be treated with special consideration, for the sake of China itself, and for the influence they will have for the mutual good will of the two countries in the next fifty years.

The conditions of Church and State might be worse in France, even under the present separation of the two. The Bishop of Rodez is Charles de Ligonès, and he has been unanimously elected mayor of the commune of Auxillac. He has been a municipal counselor for thirty years, and was acting mayor while superior of the clerical seminary.

If a nation will have a mighty navy it must either pay the bill or saddle it on posterity, in which case it pays the interest indefinitely. Such is the case with Germany, which finds itself burdened with a deficit of \$125,000,000 for the year, which must be met by an enormous loan. This makes Socialists, and ought to.

Harvard Law School would be willing to allow a young woman to study law, but higher authorities forbid. Theological schools generally will now allow women to study and take degrees, and in a few years Harvard may be expected to reach the level of fairness and decency in this respect.

American Securities

THE editors of two or three prominent European financial journals, also representatives of several powerful European banking houses, are now in this country making investigations as to the foundations of our returning prosperity. Their opinions and conclusions, set forth in interviews published here and in reports cabled across the Atlantic to their journals or financial associates, are highly favorable and tend to promote European investment in our securities. At the same time, however, feverish speculation on the New York Stock Exchange repels European investors who are conservative and cautious. While optimistic reports have been going to London from the investigating tourists, the Bank of England has raised its rate three times in as many weeks, and it is quite well understood that this action was caused directly or indirectly by the very large borrowings there by the speculative American capitalists who are believed to be responsible for the extraordinary movement in Steel shares. It is true that there is abundant evidence of returning prosperity, resting upon solid foundations, but actual investment by foreigners in our securities is not encouraged by such a stock market as has been seen here for some weeks past, a market dominated by the movement that carried a 3 per cent. stock to 94 $\frac{7}{8}$, and that clearly required enormous capital for its support. Transactions in Steel shares last week were 30 per cent. of the total, but the remarkable advance has been checked. The price at the close was 8 points below the recent maximum, and there were declines thruout the active list. This was due in part to the Bank of England's high rate. The reaction is not to be deplored.

New York's Franchise Tax

IN 1899 the New York law imposing a special tax upon the franchises of public service corporations was enacted. The collection of this tax has been stren-

uously opposed, and the amount due and unpaid at the present time, with interest, exceeds \$50,000,000. The constitutionality of the statute has been attacked, but in vain. Contests in individual cases have been given to referees, and the delay in cases of this kind has been scandalous. The present Attorney-General, Mr. O'Malley, has taken up the matter with much vigor, and his contentions with respect to the methods of assessment were sustained last week in a decision upon a test case by the State's court of last resort. Of course, it is not to be expected that the great sum in arrears will now be paid promptly, but most of the grounds of objection have been cut away and collection of a considerable part of the tax at last appears to be in sight. In New York City alone, the sum due on January 1 from street railway, gas and electric lighting companies was \$30,351,413. Under the court's decision this will suffer some reduction, but the arrears, with interest, still amount to about \$35,000,000. Nearly half as much is due in other parts of the State.

....The capital of the Bankers' Trust Company has been increased from \$1,000,000 to \$3,000,000, and the surplus from \$500,000 to \$4,500,000. The undivided profits, as shown by the recently published statement, are \$1,564,340, the deposits \$44,690,189, and the total resources \$52,124,547.

....The American Real Estate Company has bought, for investment and as a permanent home for its principal office, the eleven story modern office building known as the Night and Day Bank Building, at the southeast corner of Fifth avenue and Forty-fourth street. The price is said to have been about \$2,000,000. This building was erected in 1905, and is admirably situated. Starting in 1888 with a capital of only \$100,000, the American Real Estate Company has become one of the largest corporations of its kind, its real estate holdings amounting to about \$15,000,000.

Joseph T. Talbert

MR. JOSEPH T. TALBERT, to whose election as vice-president of the National City Bank we referred last week, was born in Mississippi forty-three years ago. His family lost heavily in the War of the Rebellion, but the boy attended school and was graduated at the University of Mississippi, at Oxford, Miss., in 1883. As a youth he had banking experience in San Angelo, Tex., and at Fort Worth. He became a National Bank Examiner under James H. Eckels in 1893, with a circuit that included California and Colorado, and the cities of Minneapolis and St. Paul, in Minnesota. In 1897 he came to Chicago in his capacity of bank examiner, and a year later Mr. Eckels having assumed the presidency of the Commercial National Bank of Chicago, Mr. Talbert was appointed cashier of the same bank. In 1904 he was advanced to the vice-presidency, which position he still holds. Two years ago Mr. Talbert was elected president of the Chicago Clearing House, which office he also now holds. Mr. Talbert is the man who arranged the merger of the Commercial National Bank

and the Bankers' National, of Chicago. He was associated in Chicago with John C. McKeon, now vice-president of the National Park Bank, and in Oxford with R. W. Jones, now of the National Reserve Bank. Mr. Talbert is a golf enthusiast and is president of the Chicago Golf Club, at Wheaton. He is a bachelor.

....Darius O. Mills has been elected vice-president of the Bank of New York, N. B. A., as successor to the late John L. Riker. Mr. Mills celebrated his eighty-fourth birthday on September 5, and has been a director of the Bank of New York for many years. He is also a director of the United States Trust Company, the Morton Trust Company, the Farmers' Loan and Trust Company, and many other well-known corporations. The Bank of New York, founded by Alexander Hamilton in 1784, is the oldest financial institution in the city, and ranks No. 1 in the list of members of the Clearing House Association, No. 2 being the Bank of the Manhattan Company, which got its its charter in 1789 thru Aaron Burr.

INSURANCE

Yale Readings in Insurance. Life Insurance, Fire Insurance. Edited by Lester W. Zartman, Ph. D., Assistant Professor of Political Economy, Yale University. New Haven, Conn.: Yale University Press. 2 vols. \$4.50.

The "Yale Lectures on Life Insurance" and the "Yale Lectures on Fire and Miscellaneous Insurance," which appeared some five years ago, have, for the past two years, been out of print, and the present volumes are intended to replace the earlier ones. A large amount of entirely new matter has been incorporated in the present work, and the opportunity afforded of bringing the treatment of the various subjects up to date has been vigorously improved. The use of technical language merely because it is technical has been eschewed, and whatever is said of the various subjects is very generally expressed in simple but clear language. In examining the book the reader is struck by the preponderance of papers by practical men, men who as presidents, actuaries, or other officers of life companies, having field experience with the problems they consider, are perhaps better qualified than are the more theoretical observers. If a study of the volume on life insurance were more universal than is now the case, much of the doubt and uncertainty regarding insurance and its problems would be swept away. There would also be less likelihood of the popularity of assessment companies, because if the man who was solicited for assessment insurance had read what Miles M. Dawson has written on the subject in the book we are considering, he would be apt to select an old line company in preference. The papers included are by men who know the various problems that arise in life insurance and whose guidance is worth while. The same thing is true regarding the volume on fire insurance. The chapter on the co-insurance clause alone is worth the price of the book. But it contains richness of material in many other fire insurance fields. The underwriter as well as the layman may easily learn much about rates and hazards, scientific fire rating, valued-policy laws, the conflagration hazard, marine insurance, steam boiler insurance, employers' liability insurance, Government insurance, the operation of compulsory workingmen's insurance in

Germany, as well as other things not here enumerated by a very casual reading of the volume in which these subjects are treated. The book forms a good working basis for the insurance man or for the man who would have or who ought to have either life or fire insurance.

✱

MR. E. DANA DURAND, the Director of the Bureau of the Census, has appointed Mr. Miles M. Dawson (a Fellow of the Actuarial Society of America) as an expert special agent to assist and advise concerning the census work on vital statistics. Mr. Durand invited the society to consider the advisability of appointing a permanent committee to co-operate with the Bureau of the Census in the work of preparing life tables, and in making such other suggestions as might seem needful in order to render the mortality statistics prepared by his bureau of greater actuarial value. After thoroughly discussing the matter, the society, at its meeting in Springfield, Mass., on the 14th inst., passed a resolution to the effect that the invitation of the Director of the United States Census Bureau be accepted, and that a committee of not less than five Fellows of the society be appointed by the president (which committee shall include the president as chairman), and that said committee shall consider any and all questions relating to the collection and compilation of vital statistics which may be submitted to it by the Bureau; shall make such suggestions to the Bureau as in the committee's opinion may seem desirable, and shall communicate its recommendations to the Bureau in writing. The committee as appointed is constituted as follows: John K. Gore (president of the Actuarial Society), actuary of the Prudential Insurance Company, Newark, N. J.; Emory McClintock (ex-president of the Actuarial Society), vice-president and actuary, Mutual Life Insurance Company, New York; Arthur Hunter (secretary of the Actuarial Society), actuary of the New York Life Insurance Company, New York; Henry Moir (vice-president of the Actuarial Society), associate actuary of the Home Life Insurance Company, New York; H. J. Messenger, actuary of the Travelers' Insurance Company, Hartford, Conn.

Survey of the World

The President's Tour

Going northward from Dallas, Mr. Taft arrived at St. Louis on the 25th ult., and at 5 o'clock that afternoon began his five days' voyage down the Mississippi River. At St. Louis he spoke in the Coliseum concerning the policy to be adopted for the improvement of inland waterways. In the audience were 177 members of Congress. Much money had been spent on waterways, he said, and not always to good purpose. The time had come for the adoption of new methods:

"Right here I would like to clear away a supposition that I am afraid has lodged in a good many minds. Waterways are not to be improved, arid and sub-arid lands irrigated and natural resources conserved for the purpose of distributing pork to every part of the country.

"Every measure that is to be taken up and adopted must be on the ground that it is useful to the country at large and not on the ground that it is going to send certain Congressmen back to Congress or on the ground that it is going to make a certain part of the country during the expenditure of that money prosperous. If that principle, and that is the one which I deprecate, is to obtain I am in favor of going along the same old way we have gone before.

"We should take up every comprehensive project on its merits and we should determine by all of the means at our command whether the country in which that project is to be carried out is so far developed as to justify the expenditure of a large sum in carrying out the project and whether the project will be useful when done. When you have determined that on the general principle of good to the entire country, then I am in favor of doing that work as rapidly as it can be done and I am in favor of issuing the bonds to do it; and if it shall turn out that some part of the country is linked to a particular project by reason of eloquent and large words and a general lively imagination that is not sustained by the facts, then that part of the country has got to wait until it can grow

up to that project. I am not minimizing the difficulties that are going to arise in selecting what has to be done or in determining the order in which those projects are to be carried out.

"Now there is a proposition that we issue \$500,000,000 or \$1,000,000,000 of bonds for a waterway and then that we just apportion a part to the Mississippi and part to the Atlantic, a part to the Missouri and a part to the Ohio. I am opposed to it because it not only smells of the pork barrel, but it will be the pork barrel itself. Let every project stand on its own bottom. Let it prove itself by means of its friends and by means of those who know whether it is to be profitable or not and then let us enter upon it, but do not let us embark on a plan that will reflect no credit on our business common sense."

Speaker Cannon, who recently declared his opposition to an issue of bonds for such improvements, sat near the President. At East St. Louis, Ill., later in the day, Mr. Taft laid the cornerstone of a new Federal building, and Vice-President Sherman delivered a dedication address. Mr. Cannon also spoke there, saying that the President had outlined the proper policy to be pursued. Later in the week he opposed issues of bonds. The flotilla on the Mississippi was led by the lighthouse tender "Oleander," carrying the President. Ten river packets followed, and among their passengers were Speaker Cannon, twenty-six Governors and more than one hundred Congressmen, and many delegates from commercial organizations to the approaching convention in New Orleans of the Lakes to Gulf Deep Waterways Association. The entire undertaking had been planned by this association. The flotilla had been preceded by naval torpedo boats. On the way down the river Mr. Taft spoke, on the 26th, at Cairo, Cape Girardeau and Hickman.

Ky., repeating the substance of his remarks at St. Louis. Mr. Cannon was also heard. He commended the President's views, except with respect to the issue of bonds. He preferred that the cost should be paid out of funds in the Treasury. The President said that the project for the improvement of the Ohio River should first be carried out, as a demonstration, and that comprehensive work upon the Mississippi should follow. It is estimated that the cost of the Ohio project will be \$63,000,000. On the 27th the President was the guest of honor at a dinner given on one of the boats by the Governors. Saying that the Federal Government should have the aid of the State Governments, he urged the Governors to meet in Washington every year:

"I should be glad to see them all, the whole forty-six Governors, in Washington every winter, and I promise that if they will come I will do everything in my power to make their stay there a memorable and pleasant one. I shall feel greatly honored to have all the Governors of the United States as guests of mine at a dinner in the White House every year, and I am certain that it would result greatly to the benefit of the whole country. The lack of uniformity in some of our laws is distressing, and yet we cannot amend the legislation of the United States in order to correct the evil that grows out of it. We must, by team play, by team action, thru the Legislatures of the States, accomplish that reform, and while we, by inviting the Governors, do not invite the legislative power of the State, we do invite these men who have much to do with directing what the legislation shall be and whose constitutional function is generally to recommend legislation to the Legislature, with very considerable influence in that regard."

He spent a few hours in Memphis, where he took part in the dedication of a new building for the Young Men's Christian Association. The packets could not keep up with the "Oleander," and the schedule was not observed. At Vicksburg they were seven hours late. A few of the voyagers had disembarked at Greenville and come to Vicksburg by railway. Baton Rouge was reached on the 20th, in the evening, and New Orleans at noon on the 30th. There the President was greeted by great crowds of people, and with much noise from bells, whistles and the guns of four warships. Having lunched with Archbishop Blenk and addressed the students of the Jesuit College he spoke in the afternoon at the convention of the Waterways Associa-

tion and dined in the evening with the Pickwick Club. At the convention he began his speech with the words, "I am delighted," and was then interrupted by a roar of laughter. "You see," he continued, "that we adopt in our Administration the Roosevelt policies in full." He was in favor, he said, of pushing the Ohio improvements to completion, and of issuing bonds to pay for them, but the Mississippi improvements should not wait for the end of the Ohio work. There should be a settled policy about the latter improvements, however, and the cost of them should be ascertained. Without approval or disapproval he mentioned Secretary Dickinson's suggestion that it might be well for the Government to experiment a bit with steamship lines on the river and to establish stations along the river for the housing of merchandise to be carried by water. He was sure, he remarked, that Speaker Cannon was working as hard as he could to reach a just solution of the river improvement problem. It is said that the Speaker's friends had been hoping that the President would commend him more warmly. On the 31st the President attended services at the Unitarian Church. He also made a tour of the city, speaking briefly at Jackson Barracks and on the campus of Tulane University.

✻

To Eradicate the Hookworm Disease

John D. Rockefeller has given \$1,000,000 to be used in eradicating uncinariasis, or the hookworm disease. It is estimated that by this disease 2,000,000 persons in the Southern States are affected. The great prevalence of it in Porto Rico attracted attention after that island became a possession of the United States. On the 28th ult. there was a meeting in New York of educators, physicians and others to whom Mr. Rockefeller had addressed a letter, asking them to take part in a conference with the hope that it might lead to the adoption of plans for "a co-operative movement of the medical profession, public health officials, boards of trade, churches, schools, the press, and other agencies for the cure and prevention of this disease." His representatives, he said, had been making an in-

vestigation. Their inquiries and the observations of others had confirmed the statements made by Dr. Charles Wardell Stiles, of the Federal Public Health Service. They might call upon him, he added, for \$1,000,000 during the next five years. As a result of the conference the Rockefeller Commission for the Eradication of the Hookworm Disease was organized, and the members of it are as follows:

Dr. William H. Welch, professor of pathology in Johns Hopkins University, president of the American Medical Association; Dr. Simon Flexner, director of Rockefeller Institute for Medical Research; Dr. Charles W. Stiles, chief of the division of zoölogy, United States Public Health and Marine Hospital Service, and discoverer of the American species of hookworm and of the prevalence of the disease in America; Dr. Edwin A. Alderman, president of the University of Virginia; Dr. David F. Houston, chancellor of Washington University, St. Louis, Mo.; Prof. P. P. Claxton, professor of education in the University of Tennessee; J. Y. Joyner, State superintendent of education in North Carolina, and president of the National Educational Association; Walter H. Page, editor of the *World's Work*; Dr. H. B. Frissell, principal Hampton Institute; Frederick T. Gates, one of Mr. Rockefeller's business managers; Starr J. Murphy, Mr. Rockefeller's counsel in benevolent matters; John D. Rockefeller, Jr.

In their letter to Mr. Rockefeller, announcing the organization of the Commission and accepting the administration of the trust, they say:

"The 'hookworm' parasites often so lower the vitality of those who are affected as to retard their physical and mental development, render them more susceptible to other diseases, make labor less efficient, and in the sections where the malady is most prevalent, greatly increase the death rate from consumption, pneumonia, typhoid fever and malaria. It has been shown that the lowered vitality of multitudes long attributed to malaria and climate and seriously affecting economic development, is, in fact, largely due in some districts to this parasite.

"The disease is by no means confined to any one class; it takes its toll of suffering and death from the highly intelligent and well to do, as well as from the less fortunate. It is a conservative estimate that two millions of our people are infected by this parasite. The disease is more common and more serious in children of school age than in other persons. Widespread and serious as the infection is, there is a most encouraging outlook. The disease can be easily recognized, readily and effectively treated and by simple and proper sanitary precautions successfully prevented. The undertaking proposed by you is therefore not only full of promise of great benefit but is eminently definite and practicable."

It was recently estimated that one-eighth of the persons employed in the Southern cotton mills had the disease. In North Carolina, of 140 college students examined, fifty-two were found to be infected. This is said to be the condition of 40 per cent. of the children in the rural schools of that State, and of nearly one-third of the students of the University of Georgia.

Important Trust Decision

After the trial of the suit against the American Sugar Refining Company (or Sugar Trust) for \$30,000,000 damages, on account of the closing of the new refinery erected in Philadelphia by Adolph Segal, the president of the Trust, five directors, Gustav E. Kissel and Thomas B. Harned, were indicted for violation of the Sherman Anti-Trust law. Kissel and Harned demurred to the indictment upon the ground that the statute of limitations had run in their favor. They claimed that five years had elapsed since the date of the offense, the refinery having been closed in January, 1904, by a vote of a new board of directors elected by means of the power obtained on account of the loan procured for Segal by Kissel. These directors acted in the interest of the Sugar Trust. After their vote the refinery remained idle. Judge Holt, in the United States Circuit Court, has now decided in favor of the claim of Kissel and Harned, and has dismissed the indictments so far as they are concerned. He says:

"The law of conspiracy has been the subject of a great deal of over-refined discussion and the authorities upon the subject are quite conflicting. Some hold a conspiracy to be an offense complete when entered into, upon which the statute of limitations immediately begins to run. Others hold it to be a continuing offense, from which it is argued that the statute of limitations never begins to run against a conspiracy until it has been abandoned and whatever result has been accomplished by it annulled.

"The Government's counsel claims that the defendants, having once entered upon the conspiracy and closed the refinery of the Pennsylvania company, continued to be engaged in the conspiracy every day, so long as the refinery was closed. It would follow that the only way in which the statute of limitations could be started running would be to rescind the vote to close the refinery, have the directors friendly to the American Sugar Company resign, and deliver back to the original holders the stock taken as collateral.

"But a conspiracy in restraint of trade is

nothing but a contract or agreement between two or more persons in restraint of trade. If this indictment had charged 'that the defendants made a contract in restraint of trade' I suppose no one would claim that the statute of limitations did not begin to run as soon as the contract was executed. How can the Government impose a different liability by calling the thing by another name?"

The decision is regarded as one of much importance. An appeal will at once be taken by the Government to the Supreme Court. The Department of Justice has published a statement. Having said that Judge Holt express the opinion that in the Sherman act—which declares that "every contract, combination in the form of trust or otherwise, or conspiracy in restraint of trade, is illegal"—the word "conspiracy" has the same meaning as the word "contract," the Attorney-General continues:

"The Department of Justice, on the other hand, has always entertained the view that Congress employed the different words advisedly, that a 'contract' in restraint of trade is not the same thing as a 'conspiracy' in restraint of trade, and that where the law enacts that every person who is engaged in a conspiracy to restrain trade is guilty of a misdemeanor, it means that so long as the conspirators are continuing in a course of conduct which restrains interstate trade or commerce, they are violating the act, and that where the restraint of trade may be terminated by their voluntary act, and not otherwise, the statute of limitations does not begin to run in their favor until they perform the act which terminates the restraint, and allows the current of trade, which they had interrupted, to resume its course."

In Defence of Mr. Crane

After making investigation as to the dismissal of Charles R. Crane, as Minister to China, by Secretary Knox, fifty prominent residents of Chicago, Mr. Crane's personal friends, have signed a statement commending him and inviting him to be their guest at a dinner. In this statement they say:

"We desire in this public manner to express our appreciation of your character and disinterested public services. We regard as not the least of these services your vigorous advocacy of the protection and extension of American commercial and political interests in the Orient, in full accord with the well-known views of President Taft and with his epoch-making

"When the President appointed you Minister to China (an honor unsought and unexpected by yourself) you accepted the position at per-

sonal sacrifice, and your many friends cordially approved the President's choice. Your intimate knowledge of China and its people, the wide scope of your experience in business matters thruout the world and your extensive personal friendship with many who hold responsible positions in foreign affairs contributed to your fitness for the position.

"Your unusual discretion, prudence, wisdom and modesty had been demonstrated to us by an acquaintance extending over twenty-five years of an active business and social life. So far no conduct of your own has diminished our confidence in your fitness.

"We believe that the published circum-

GENERAL OLIVER O. HOWARD
DEPT. OF COMMERCE, 1907

stances, trivial in themselves, were unfairly made use of in an attempt to humiliate you without adequate cause; and we wish by this means, publicly to protest against such methods, which cannot fail to have a tendency to discourage prominent private citizens from accepting public offices."

Among those who signed this statement are the following: James B. Forgan, president of the First National Bank; C. L. Hutchinson, vice-president of the Corn Exchange Bank; Harry Pratt Judson, dean of the University of Chicago; David R. Forgan, president of the National City Bank; Charles G. Dawes,

president of the Central Trust Company and formerly Comptroller of the Currency; George E. Roberts, president of the Commercial National Bank and formerly Director of the Mint; Victor F. Lawson, proprietor of the *Record-Herald* and *Evening News*; H. H. Kohlsaat; D. H. Burnham, of D. H. Burnham & Co., architects; S. M. Felton, president of the Mexican Central Railroad, and A. J. Earling, president of the Chicago, Milwaukee & St. Paul Railroad.

British Politics The bye-election in the Bermondsey Division of Southwark was regarded

as the crucial test of the power of the two parties because it was the first that had been held since the issues were clearly defined and the results were expected to forecast the fate of the Government at the coming general election. The borough was carried by the Unionists and accordingly the Opposition feels greatly encouraged. The Unionist candidate, however, was elected by a plurality, not a majority, for it was a three-cornered fight, and if the Liberals and Socialists had combined, as they have in many cases, they would have carried the election. The vote was as follows: J. Dumphreys (Unionist), 4,278; S. L. Hughes (Liberal), 3,291, and Dr. A. Salter (Socialist), 1,435. The borough is in the working class district of London and in 1900 was carried by the Unionists by 300 majority. Three years ago, however, it went Liberal by a majority of 1,759. The campaign this year was made on a straight issue between the Liberal budget and a protective tariff. The Bermondsey election disclosed new tactics on the part of the Suffragets, who invaded the election booths and attempted to destroy the ballot boxes. In one of the booths Mrs. Alice Chapin threw a bottle containing a mixture of ink and acid at the ballot box, but her aim being poor only a small amount of the liquid entered the box, destroying two ballots, while the acid splashing in the face of one of the election inspectors severely injured one of his eyes. Mrs. Chapin was arrested and taken before a magistrate, where she was released on \$500 bail.—As the political

excitement in England increases on account of the approach of the election, some of the party leaders are losing their tempers and using language altogether unprecedented in British politics. Mr. Balfour, leader of the Opposition, in a public address, made a furious attack upon the Lord Advocate for Scotland, Alexander Ure, because he said that if the Conservatives came into power they would abolish old age pensions. Mr. Balfour announced this as "a frigid calculated lie" and said further that the Lord Advocate dishonored his office, the legal profession, and the country in which he was born. He could not understand how a man of Mr. Ure's traditions, experience and ability could speak so low. He confessed himself sorry that Mr. Ure was a Scotchman. The Lord Advocate replied in a public speech on the following day in which he returned all the compliments, declaring that Mr. Balfour's attack was outrageous and abominable, and that there was not a vestige of truth in the charges brought against him. He was sorry that Mr. Balfour was a Scotchman.—The Irish Land Bill passed the House of Lords on October 25, in a greatly amended form. Premier Asquith announced in the House of Commons that on November 5 he would move the rejection entire of the amendments made by the Lords, and that the House of Commons would then adjourn until November 23. The Budget Bill has now been passed thru the report stage and after its formal third reading and a few days of further debate, it will be sent to the House of Lords, which will have it under consideration during the recess of the House of Commons. Mr. Lloyd-George, Chancellor of the Exchequer, in discussing the bill, explained that the higher duties placed upon alcoholic liquors had had the effect of decreasing their consumption, so that instead of the \$8,000,000 expected from the revenue tax on spirits, only about half that would be received. In some districts of Ireland the consumption of liquor had declined 50 per cent., and in Scotland 70 per cent. He estimated that there would be a permanent reduction of 20 per cent. in the spirits drunk in Great Britain and the social improvement would be gigantic.

A Greek Naval Mutiny

The success of the recent military mutiny inspired a similar movement on the part of the naval officers last week, but this not meeting with the approval of the Military League, speedily and ignominiously collapsed. The army having got all it wanted from the Government, the navy felt that its turn should come. Thirty naval officers formulated their demands, which were the suspension of all promotion for five years and the abolition of the higher posts in the navy, including that of Rear Admiral, held by Prince George until his recent forced resignation, two vice admirals and fifteen lesser positions. These demands were approved by the Military League, which, as usual, presented them to the Government as an ultimatum, requiring the Chamber to pass the measure within twenty-four hours. The Premier agreed to take the action demanded, but insisted that the ordinance should be put in an impersonal form, by lowering the age limit for retirement from sixty-five to fifty-eight years. But the naval men refused to consider any compromises, and their leader, Lieutenant Tibaldos, had a stormy interview with the head of the Military League, Colonel Zorbas, in which he insisted that he be made Minister of Marine. When Colonel Zorbas declined to support this demand, Lieutenant Tibaldos left the room, saying:

"I led the last revolt and without me it would have failed. Now you abandon me, but I will carry out a second revolt single-handed."

He then went to the arsenal at Salamis, and by threat of force compelled Vice Admiral Buduris, who had command, to surrender it. The mutineers seized a part of the flotilla of torpedo boats and submarines, and with these fought a twenty-minute engagement with the battleship squadron, under Captain Mizoules, assisted by the guns of the land forts. Few of the shots took effect, but several of the arsenal buildings were damaged, and on board the torpedo boat "Sphendone," struck by a shell, three of the mutineers were killed and several wounded. On the loyal battleship "Hydra" two men were killed and two wounded. The total number of men engaged in the mutiny was about 300. Half of them were landed at Rinnetto, where they attempted to hold up a train

bound for Larissa, but they were dispersed by the gendarmes. Lieutenant Tibaldos is still at large. The torpedo boat "Velos," of which he was in command, returned to the dock without him. In the discussion of the affair in the Chamber one of the Deputies advocated the shooting of the leaders of the mutiny, whereupon two other members called for the same punishment for the leaders of the former mutiny. The Military League demanded the arrest of these two Deputies, but the Chamber refused. This is the first time that any opposition has been shown to the wishes of the Military League. They deposed Premier Theotoki in July, and Premier Ralli in August, and Premier Mavromichalis holds his place only because of his complete subservience to Colonel Zorbas. The deposition of King George and the establishment of a military dictatorship is talked of, but this seems hardly necessary under the circumstances. All the measures prepared by the League were passed without amendment and in most cases without discussion. Among these is a finance bill imposing new and heavy taxes, half of which goes to the army and navy. It is proposed to raise the active strength of the army to 216,000 men, making, with the reserves and national guard, a total of 450,000. All young men in Greece between the ages of sixteen and nineteen are obliged to take military drill once a week. Foreigners are to be employed in the organization of the new fleet and army. The Chamber, at the dictation of the League, has abolished two courts of appeal, 122 courts of justice of the peace, and eleven criminal courts. A Supreme Council has been instituted, charged with the promotion, transference and dismissal of judicial functionaries.

Assassination of Prince Ito The interview between Prince Ito and the Russian Minister of Finance, Mr. Koskovsoff, which was expected to take place last week and settle the Manchurian question, was frustrated by the act of a Korean fanatic, who shot down the prince in the railroad station at Harbin. Prince Ito had just stepped from the railroad train and was advancing to meet the Russian Minister when a young

Korean stepped before him and fired seven shots in rapid succession from an automatic revolver. Three of the bullets entered the body of the Prince. The stray shots struck Mr. Kawakan, his private secretary; the Japanese Consul General, and General Manager Tanaka, of the South Manchurian railroads, who were badly, but not fatally, wounded. The assassin, who was accompanied by two other Koreans, made no attempt to escape, but when arrested declared that he came to Harbin for the sole purpose of assassinating Prince Ito, to avenge the wrongs done to his country. He confessed, however, that he had been embittered by personal injuries, as some of his friends had been executed by the Japanese. Altho the murder took place in the Russian station, it is not believed that the Russian police are in any way to blame, because it was Prince Ito's request that the Japanese should not be excluded from the station. Large crowds of his countrymen had assembled to welcome him and some Koreans had slipped in among them on account of their resemblance to the Japanese. The prince died upon the platform of the station within twenty minutes after he was shot, and the body was placed at once in a coffin and started for Tokyo. The Japanese people, from highest to lowest, are plunged in grief at the untimely end of one of the last and greatest of the Elder Statesmen, who had created the empire. Expressions of sympathy and tributes of respect have been sent to the Emperor from the heads of all foreign nations, including an especially sympathetic message from President Taft. It was feared that the deed would cause the Korean people to be more severely treated by the Japanese in the future, but it is officially announced that no change will be made in the Japanese policy in regard to Korea or in the method of its application. It appears that the assassination was the result of a conspiracy on the part of an association of young Korean patriots having their headquarters in the Russian city of Valdivostok. It is perhaps the same organization which was responsible for the assassination of Durham White Stevens in San Francisco. The man who fired the shots is Inchan Angan, former editor of a newspaper in Seoul. He confessed that he belonged to an organization of twenty

Koreans who were sworn to kill the Prince.

✱

Foreign Notes The system of exile by administrative order, which has been regarded as the most disgraceful feature of the Russian system, is likely to be abolished by the Duma. The Conservative members introduced a bill prohibiting the practice of exiling prisoners to points within European Russia and the Judicial Committee to which it was referred has amended it by including Siberia.—The Finnish Senators who declared that they would resign in a body if the Russian Government persisted in its attempt to force the military system of Russia on the Grand Duchy have reconsidered their resolution and will retain their seats for the present along with the new appointees of the Governor-General. A bill has been introduced into the Diet granting the right of residence to Jews who were born in Finland or have lived there for a decade.—The new Liberal Cabinet of Spain has declared its intention not to prosecute further the war in Morocco. General Marina has been instructed to fortify the positions already occupied in the vicinity of Melilla and not to push the campaign further. By the aid of the Sultan's emissaries it is expected that the Riffians will be induced to disarm. General Weyler, formerly of Cuba, has been made Governor-General of Catalonia, the scene of the recent riots. The new Minister of War, General de Luque, states that the Liberal Government disapproves of the way in which the disorders in Barcelona had been repressed by the preceding Ministry, but holds that Ferrer had been proved guilty by the evidence and had been legally executed.—That Austria is determined upon an extensive increase of armament is shown in the budget bill for 1910 just presented to the Lower House. This provides for an extra appropriation of \$64,000,000 for the army and navy. There is an estimated deficit of about \$10,000,000 which must be met by increased taxation.—The German Government is, like the British Government, planning a tax upon the unearned increment of land values. The new tax is expected to bring in \$5,000,000 a year at first, but may be extended later.

GREAT AMERICAN UNIVERSITIES—XI.

University of Pennsylvania Chronicle

THE PENNSYLVANIAN

ADMISSIONS
OLD BUILDINGS

UNIVERSITY of PENNSYLVANIA

by EDWIN E. SLOSSON

THE University of Pennsylvania is a baffling subject to me. Of all the other universities I visited I got, by the end of a week, an impression of the character of the institution as a whole which, however erroneous it may have been and inadequately conveyed to the reader, was, nevertheless, tolerably clear and definite in my own mind. If I had stayed another week in a university it would doubtless have become hazy and confused and if I had stayed a month or more I should have known so much about it that I would not have had the courage to formulate any conclusions whatever. My film would have been fogged by over-exposure. But for the University of Pennsylvania the week was not the proper time. I could not get it focussed. I came away with the feeling that I had not seen the university, I

had only seen some of the buildings and some of the faculty and students. I had discovered many of the characteristics of the university but not its character. Before going to a university it was my custom to take an inventory of my information and preconceptions regarding the institution to be next visited. In the case of Pennsylvania I was surprised and ashamed to find how little I knew of one of the largest universities of the country. When I got back and took account of stock I was still more surprised and ashamed to find how little I still knew, or, rather, understood.

The worst of it was there was nobody I could blame for it except myself. They are all affable and obliging in the University of Pennsylvania, from the Provost to the janitors. All hospitable, too; the fraternities could not have treated me any better if I had been a long lost brother instead of an outside barbarian who, as an undergraduate, had been opposed to fraternities on principle; the

principle being that I was not asked to join one until after I had got over wanting to. Then there is at the University of Pennsylvania a rare and useful department, a Bureau of Publicity. This consists of an accommodating young man, some typewriter girls and a suite of rooms in Houston Hall containing all sorts of statistical and historical data re-

publications and files of photographs, all carefully indexed. No other university, so far as I have found, has such a complete and convenient collection of material for the present and future study of the institution. I have felt the need of an office of this kind when I have had to walk miles over campuses east and west in search of certain men who were said

CHARLES CURTIS HARRISON,
Provost of the University of Pennsylvania.

lating to the university, the diagrams and exhibits that had been prepared for various expositions, sets of university

to know something that I said I wanted to know. In particular let me suggest that there should be in each university a

society or, preferably, a person, whose duty it is to collect fugitive publications of all kinds, programs of clubs and festivities, posters and declarations of inter-class war, meteoric periodicals and snapshots of student life. A file of catalogs and doctors' dissertations will not satisfy the needs of future historians and biographers. They must have something more if they are to make these dry bones live.

Lastly, in enumerating the facilities I had at Pennsylvania for acquiring the knowledge I did not get, I was lodged at Houston Hall. Houston Hall is to the University of Pennsylvania what the forum was to Rome. Kipling says there are four street corners whereon if a man stand long enough he will see everybody of importance in the world. It could be said with less exaggeration that a man could see anybody in the university by taking his stand under the memorial tablet that bears the name of Henry Howard Houston, Jr., B. S. MDCCCLXXVIII, and he probably will not have to wait very long either. Seven thousand persons pass thru the door in a day, not allowing for repeaters.

Houston Hall is a big clubhouse, handsomely furnished but not embarrassingly elegant, designed by two architectural students, and intended for the use of the students as a whole. The remarkable thing about it is that it is so used. The Pennsylvanians, old and young, seem to take more pride in it than in anything else about the university. It is practically a unique institution. Most universities have nothing at all corresponding to it. The Harvard Union is its nearest counterpart, but at Harvard certain classes of students call the union "the poor man's club" and take pride in not being seen in it, while in Pennsylvania there is very little of that feeling. Here rich and poor, Greek and barbarian, Jew and Gentile, wise and unwise, bond and free, meet on terms as near to equality as could be expected under present conditions. The building contains a post office, an auditorium, and rooms for reading, writing, billiards, trophies, Y. M. C. A. and various student societies. There is also, filling a long felt want very inadequately, a lunch counter. This department should be expanded and given better quarters. The cafeteria or "help-

yourself" plan now so popular in large cities is still better adapted to student lunch rooms and on account of its cheapness could easily be made to pay.

The importance of Houston Hall lies in the fact that it is serving a nucleus in the process of unification or crystallization by which a congeries of professional schools is becoming a definable university. Houston Hall is like the string in a stick of rock candy. Here medics, dentists, engineers and collegians have a chance to learn to regard one another otherwise than as hereditary enemies. In organization the University of Pennsylvania is in a stage of development about such as I imagine Columbia was some ten or fifteen years ago.

The process of evolution by which it is passing from a state of indefinite incoherent homogeneity to a state of definite coherent heterogeneity, etc., has been very slow and strangely retarded. For Pennsylvania is the oldest university in America. The others were colleges. The name university was first conferred upon it by the Legislature in 1779. The difference in name was not altogether without significance. The institution was in its early days more of a university than its rivals. Here the first medical school in the United States was established in 1765, "the fees for the course not to exceed six pistoles." It opened the first American law school in 1790. In fact, I cannot mention all of the things in which the University of Pennsylvania has been first. I must, therefore, devote myself in accordance with the plan of these articles, to those things in which the university is first. This will take less space.

But it is impossible to ignore history in dealing with the University of Pennsylvania. One cannot get away from it. All the walls are covered with it. The buildings are genealogical museums. Paintings, bas-reliefs, inscriptions, windows, relics, manuscripts and similar memorabilia catch the attention of the visitor wherever he goes. The painted faculty outnumbers the living.¹ I wonder if teachers and students do not get discouraged sometimes at the thought of

¹The Official Guide enumerates 205 oil paintings, mostly portraits of former presidents and professors. The catalog lists 148 professors and assistant professors.

having to do credit to so long a line of such distinguished predecessors as these look to be. The effect is overpowering to one who has been visiting the Western State universities where they rarely have anything over twenty-five years old. If they have they apologize for it and explain that they will get a new one when the Legislature raises the appropriation to a decent figure. In Western colleges the literary societies are the most evanes-

It should be stated as the first and most important fact about the University of Pennsylvania that it was founded by Benjamin Franklin. That is not engraved on the stationery of the University as "Founded by John D. Rockefeller" is on that of Chicago, but the visitor acquires the information without any exertion on his part. It does not, however, serve to differentiate the University of Pennsylvania from other Philadelphia in-

cent of organizations. They usually die or turn Greek in a few years. But in the University of Pennsylvania there are two literary societies which are eighty and ninety-six years old respectively, and still living, actually alive and working. They are the Zelosophic and the Philomathean. Their age could be told approximately by their names, for the same rule holds in this as in paleontology, the longer the name the older the specimen.

stitutions. The University, the Franklin Institute, the American Philosophical Society, the Public Library, Girard College, the Manual Training School and the *Saturday Evening Post*, all owe their origin in some sense to that fertile and practical brain. The question naturally arises what would there be at Philadelphia if Franklin had not been starved out of Boston?

The remarkable thing about Franklin's

ideas is their vitality and persistence. They are as hard to get rid of as sweet clover. If they are trampled into the mud by one generation they grow underground and sprout up in the next. The University of Pennsylvania is still raising crops from the old seeding and has not yet exhausted it. The germ of the University of Pennsylvania was a little pamphlet entitled "Proposals Relating to the Education of Youth in Pennsylvania, B. Franklin, Printer, 1740." The most revolutionary of his proposals and the one he had to fight for hardest was "teaching the English tongue grammatically and as a language." On the idea exprest in the phrase "as a language" he was most insistent. He says:

"Reading should be taught and pronouncing properly, distinctly, emphatically; not with an even tone which underdoes nor a theatrical tone which overdoes nature."

His specifications for a head master

This material was obtained from the Bureau of Education, Circular of Information No. 2, Washington, D.C.

of the school, tho not including all the virtues now demanded of the college president, are strong on this point:

"That the rector be a man of good understanding, good morals, diligent and patient, learned in the languages and sciences and a correct pure speaker of the English tongue."

An Englishman visiting the institution in its early days notes with astonishment and admiration that "they have a professor whose sole business it is to teach boys their native tongue grammatically and instruct them in reading and pronouncing it with propriety."

But in this Franklin was too far in advance of his age to be immediately successful. The English department of his seminary was systematically neglected and narrowly escaped annihilation. Nowadays there are English professors everywhere, altho it may be doubted whether they are teaching their subject as Franklin would have them. The question may also be suggested whether our universities are not now overlooking the need of training in something as obvious and everyday as "the native tongue," while they are searching the universe for more recondite topics to teach. In eulogizing Franklin we should not neglect to imitate him in the open-eyed recognition of contemporary demands.

Altho Franklin was specially interested in the English School, yet he was not intolerant in the matter of languages. He advocated a differentiation of courses as follows:

"All intended for divinity shall be taught the Latin and Greek; for physics the Latin, Greek and French; for Law the Latin and French; merchants the French, German and Spanish."

The modern physician would substitute German for the Greek but some of our leading colleges would come nearer meeting the needs of the times if they adopted Franklin's system as it stands instead of their present requirements. They will probably begin to require Spanish of their commercial students about the time when instruction in Chinese becomes urgently needed.

Franklin regarded Latin and Greek "as the *chapeau bras* of modern literature"—the fashionable hat of the day, made to be carried and never to be worn. Public opinion in America has come to agree with him on the question of Greek

and it has been generally laid aside; but whether as the direct result of the sacrifice of Greek or from other causes, Latin is more popular than ever. It would probably be safe to say that there are now more persons in the world able to read Latin than there were in the age of Augustus. The number and proportion is increasing. In 1890 33.62 per cent. of the pupils in the public and private high schools of the country were studying

Latin. In 1906 the percentage had risen to 50.17.³

Two of Franklin's educational ideas, that is, training for citizenship and for commercial pursuits, were slow in cropping out, but at length found embodiment in the Wharton School of Finance and Commerce and in the Evening School of Accounts and Finance. The primary purpose of James Wharton in endowing such a school was to free people from financial and political delusions and to promote honesty and economy in private and public affairs. A quotation from the document in which he set forth his plan in 1881 will show how Franklinian it is in style and spirit:

"The general tendency of instruction should be such as to inculcate and impress upon the students—

"(a) The immorality and practical inexpediency of seeking to acquire wealth by winning it from another rather than by earning it thru some sort of service to one's fellow men.

"(b) The necessity of system and accuracy in accounts, of thoroughness in whatever is undertaken and of strict fidelity in trusts.

"(c) Caution in contracting private debt directly or by indorsement, and in incurring obligations of any kind; punctuality in payment of debt and in performance of engagement.

"(d) The deep comfort and healthfulness of

³Report of Commissioner of Education, 1907, Vol. II, p. 1052. The figures for the various school studies may be obtained from the following table: 1890, 18.8 per cent.; 1906, 11.12 per cent. Foreign History, 1890, 20.83 per cent.; 1906, 15.43 per cent. Chemistry, 1890, 9.62 per cent.; 1906, 6.86 per cent.

pecuniary independence, whether the scale of affairs be small or great.

"(e) The necessity of vigorously punishing by legal penalties and by social exclusion those persons who commit frauds, betray trusts, or steal public funds, directly or indirectly. The fatal consequences to a community of any weak toleration of such offenses must be most distinctly pointed out and enforced.

"(f) The fundamental fact that the United States is a nation, composed of populations wedded together for life, with full power to enforce internal obedience, and not a loose bundle of incoherent communities living together temporarily, without other bond than the humor of the moment."

The presence of a large body of young men who have been imprest and inculcated with these principles ought to make Pennsylvania a model commonwealth.

The Wharton School being opened in 1883 was slightly antedated in part of its field by the establishment at Columbia in 1880, and at Michigan in 1881, of schools of social and political science. It has the honor, however, of founding the first

professorship in American history, held by John Bach McMaster. Here originated the *Annals of the American Academy of Political and Social Science*, when Edmund J. James, now president of the University of Illinois, was the Professor of Finance and Administration in the Wharton School, Professor Rowe, of the Wharton School, is now president of the Academy.

Mr. Wharton in specifying what should be taught in the school he founded also stated how he wanted it taught, in language which shows that he was aware of the common faults of college instruction:

"All the teaching must be clear, sharp and decisive, not languid or uncertain. The students must be taught and drilled, not lectured without care whether or not attention is paid. Any lazy or incompetent student must be dismissed."

This is easier said than done. In such few classes as I visited I did not detect any superiority over the work done elsewhere. The students in fact seemed less

THE MEDICAL LABORATORY

This is the front of the new buildings of the University. It was completed in 1904 at a cost of about \$700,000. The length is 327 feet and the width 192 feet. The interior is finished in white Italian marble.

orderly and attentive than usual tho showing their interest in the subjects by a readiness to question and argue. The

subjects which in most universities are called "snaps" or "cinches," such studies as geography, anthropology, sociology,

ENTRANCE TO A DORMITORY COURT.

evening students appeared more diligent and docile than the day students, probably because their opportunities cost them more personal sacrifice, perhaps also because they were tired by a day's office work. The chief difficulty the Wharton School has had to contend with is the diversity in the aims and preparation of its students. Some have entered the school because they were ambitious; some because they were not. In its earlier days especially it suffered from serving as a catch-all for those who could not keep up in the ordinary college course; and a man who cannot keep up in the ordinary college course is pretty slow. The Wharton entrance requirements are less than for the rest of the college, and there are many special or short course students. The regular four years' course of the Wharton School requires no physical or natural science and only one foreign language, and the prescribed work is necessarily composed chiefly of those

political economy, administration, English literature and the like. It is very unfortunate that these studies, which from their natural interest and great importance are specially adapted to form the core of a modernized humanistic education, make such slight demands upon the students' activities. A core needs to be stiff and tough. Of course any study can be made artificially laborious and time-consuming to any desired degree by loading it with extraneous drudgery, but it ought not to be necessary to resort to this common pedagogical trick. Sometimes the students see thru it. It remains to be seen whether the social sciences, as they become systematized, will develop some mode of training corresponding to laboratory work in the sciences, handicraft in the fine arts and translation in the languages. As now taught in our universities generally they require little more of the students than the ability to sit still in a chair for three-quarters of

an hour several times a week. This really is no trouble unless one has something else to do, for the lectures are often made exceedingly attractive by epigrams and illustrations. It is hard to suggest any way in which they could be improved in this respect; not impossible, however, for a story is told of a Western university where the professor of sociology had discarded the antiquated lantern slide system and introduced a moving picture apparatus, which showed slum life and settlement work with great vividness. At the close of the lecture he asked a favorite student loitering by his desk what he thought of the innovation. The student commended it with the moderation of manner and falling inflection characteristic of seniors, but added: "Say, Professor, couldn't you run in some illustrated songs to relieve the monotony?"

So far as I know the social science faculty of the University of Pennsylvania have not yet taken to moving pictures, tho I hope they will, for it is doubtless a legitimate and useful mode of conveying information. But so long as the lectures in these studies remain largely informational and the attitude of the students chiefly passive receptivity, the students will be sneered at by the men in engineering and medicine—and a certain fraction of them will deserve it. I have no reason to think that this fraction is larger in the Wharton School than elsewhere.

It is, of course, natural that the men in the old and established professions should regard with amused incredulity the efforts being made to create a new profession, or, rather, a group of new professions, for the University of Pennsylvania has recognized, more than other universities I believe, that to be practical the courses must be specialized. One of these professions is already emerging from the chaos and taking definite form in Pennsylvania. The State Board of Examiners of Public Accountants in 1907 raised their requirements much above those of any other State, virtually making a three years' course of study necessary for a certified public accountant, and the Evening School of Accounts and Finance is the only place in the State which gives the required instruction. The complete course in this school occupies four evenings a week for three years, and

the students who have completed it are said to be better equipped than those who have completed the two years' special course in the Wharton School because of their more advanced work and their office experience. There is no degree but a certificate of proficiency is given. Students under twenty-one are required to have a three year high school course for admission.

I have given a good deal of space to the Wharton and the Evening Schools because it is one of the most original and promising movements in the university. Taken together they include 725 students, more than any other department and twice as many as are in the College of Arts and Science. It is an attempt to meet two of the needs of modern life that many universities ignore; it gives systematic training in the technique of business and brings it within reach of the men who need it most, those already in business. The department is over-crowded and should soon have the new building which it has long been anxiously waiting. There are opportunities for unlimited expansion in various directions. By co-operation with the engineering schools it could develop courses combining finance and manufacturing which would be of great usefulness in Pennsylvania. The exceptionally large foreign contingent affords an opportunity to prepare young men to take advantage of the new openings for American trade with Latin America and the Orient. I was surprised to find that there seemed to be no connection between the Wharton School and the Philadelphia Commercial Museum, whose new buildings are close by. The City of Philadelphia could greatly increase its importance as a center of international commerce if it made a systematic effort to utilize the facilities of the university for that purpose. I got the impression, which may be altogether wrong, that the Wharton School in its effort to individualize itself had somewhat isolated itself. If so, it is unfortunate because both politics and finance ought to be kept in close touch with the things that they serve. I should think there would be danger lest the school should turn out men who had no higher aim than to become politicians or stock-brokers or both.

The centrifugal forces are strong in the College of Arts and Science. The tendency toward the disintegration of the old College, everywhere noticeable, has here full sway. Each group of allied studies organizes a school and then agitates for autonomy like a Balkan province. Nobody knows where it will all end. If they keep on splitting off pieces from the College of Arts there will be left only a flock of studies which nobody has any particular use for and a group of students who have no particular use for themselves. In some universities, Cornell, for instance, they are worrying about this a good deal. But nobody seems to worry in the University of Pennsylvania about anything.

Another indication, besides the Evening School of Accounts, that the university is aiming at a greater usefulness to the community is the opening of college courses for teachers and others whose time during the usual hours is occupied. The classes are held on afternoons and evenings and on Saturday forenoon. The admission requirements are the same as for regular College and the same baccalaureate degrees are given at the completion of the work which, however, may be strung out thru as many years as necessary. The range of courses so offered is limited but includes the fundamental studies in most departments, and a further opportunity is offered by the summer school which is growing rapidly in popularity. For most of the summer courses credit is now given and the master's degree may be attained by summer work alone. This will attract more advanced and serious students; and if the facilities keep pace with their demands the summer session may eventually prove as profitable an adjunct to the university as it is to Columbia and Chicago. Those universities, however, have strong educational departments which Pennsylvania yet lacks. But a good start has been made toward this by the introduction of some professional courses in pedagogy, and particularly the novel and interesting work being done by Prof. Lightner Witmer on the development of retarded children. I had a chance to see his "Psychological Clinic" in operation. It resembled a public dispensary. In the waiting room were teachers and parents with

open-mouthed, dull-eyed and logy children waiting for examination or treatment. Then in the amphitheater I saw children who a few months before had been equally unattractive and unpromising but now were doing sums on the blackboard and cutting up between times. Such was the transformation affected by a little surgery, some hygiene and a great deal of patience.

Thru the opening of the teachers' courses and the summer school, women now have a chance to enter most of the undergraduate departments of the College of Arts and Science and to obtain degrees. They are like special trains in a railroad system; they get a chance at the track whenever the regular schedule leaves it free. Still with a little ingenuity and inconvenience they can get about what they want. The graduate classes and degrees of the College are open to women on the same terms as men altho by a catalog fiction they are in a separate administrative department. There are several graduate scholarships provided for women, and special accommodations are to be made for them in the new graduate building. They form now about a fourth of the graduate school. The interlacing of courses and the elective system naturally bring women into an increasing number of classes and as the men discover what harmless and inoffensive creatures they really are the prejudice against them will gradually fade away. This consummation would be pleasing to the Founder.

There has been for twenty-five years one curious exception to the rule that women were excluded from the College. The Biological Course, a regular four-year course chiefly composed of botany and zoölogy, but with a rather wide range of election, has always been open to them. I was at first puzzled to see why the women should be allowed to study natural sciences but not literature, which most of them prefer. But on reflection I saw what the reason for the distinction must be. There is nothing immoral to be found in biology; but the classic literature of every language except the Chinese contains obscenities or passages offensive to a refined taste. If any such discrimination is to be made no better grounds for it could be found.

CLASS-DAY EXERCISES IN THE TRIANGLE.

In the exclusion of women from the Medical School another factor comes into play, which does not exist in the pure science, that is, the trades-union spirit or professional jealousy. This came out clearly in the conversations I had with medical students. When I inquired why they were so opposed to women students, they urged the objection often heard where coeducation has not been tried, that it would be embarrassing to attend clinics and lectures in the presence of the opposite sex. I appreciated the modesty and chivalry that prompted this reply, but I suggested that the presence of female nurses must be equally embarrassing. The answer was, "Oh, no. We don't mind the nurses. They are a sort of servants, you understand." I did.

It is hard to account for these local variations. Johns Hopkins Medical School, a few miles to the south, has women both as students and instructors. The Law School of the University of Pennsylvania admits women. There are usually two or three in attendance and some of them have made creditable records. On the other hand a Vassar graduate knocked in vain at the doors of the Harvard Law School last month. Some branches of the legal profession seem peculiarly adapted to feminine tastes and talents and it is likely that they will be largely given over to the women in the future. The fair sex also do well in some of the financial and commercial vocations so there is no reason why the Wharton School should be monopolized by the unfair sex.

No other university of these fourteen has so many handsome new buildings as

Pennsylvania. I do not know that all of the rest of them put together can match them. The Medical Laboratory Building is only excelled in splendor by the group of medical buildings at Harvard. The dormitories are only rivalled by those of Princeton. The Law Building has none in its class save Harvard's. The only thing to compare with the Engineering Building is the Mining Building of the University of California and that is not nearly so large and comprehensive. And as for the Veterinary Building no other comes into consideration. The University of Pennsylvania has better accommodations for its pigs than most universities have for their presidents.

Dark red brick with light limestone trimmings is the material of most of the buildings. In type they are varied but harmonious. The prevailing style of architecture is what I should call the English Collegiate. The reason I should call it so is because I have found that the most convenient term to use in talking about new university buildings anywhere. One is less liable to be contradicted when he says English Collegiate than anything else. Anyway I have put the pictures in so if I am wrong the reader will discover it and that will give him more pleasure than if I used the right word. I like to give pleasure.

One thing more remarkable about all these new buildings than their fine appearance is their adaptation to their purpose. They have been planned as well as designed. I do not know how much of the credit for this goes to Messrs. Cope & Stewardson, but somebody deserves a great deal of credit for not making the

professors and students work in buildings about as inconvenient and uncomfortable as medieval armor. There are fewer gargoyles on the outside of these buildings than some but there are more conveniences inside. They are well lighted and heated and ventilated; they are cleanly and incombustible.
